PUBLIC HEALTH.

ELEVENTH REPORT

OF

THE MEDICAL OFFICER OF THE PRIVY COUNCIL.

WITH

APPENDIX.

1868.

Presented pursuant to Act of Parliament.

LONDON:
PRINTED BY GEORGE E. EYRE AND WILLIAM SPOTTISWOODE,
PRINTERS TO THE QUEEN'S MOST EXCELLENT MAJESTY,
FOR HER MAJESTY'S STATIONERY OFFICE.

1869.

TO THE LORDS OF HER MAJESTY'S MOST HONORABLE PRIVY COUNCIL.

My Lords,

In obedience to the Public Health Act, 1858, I have the honour of herewith submitting to Your Lordships, for presentation to Parliament, my Report of the proceedings which Your Lordships under that Act directed to be taken during the year 1868. And for the present purpose I treat as part of that subject-matter the proceedings which Your Lordships directed to be taken under the Vaccination Act, 1867.

I am, my Lords,
Your Lordships' obedient servant,
JOHN SIMON.

Medical Department of the Council Office,
8, Richmond Terrace, S.W.,
March 31st, 1869.

MEDICAL OFFICER'S REPORT.

I.—Vaccination.

New Vaccination Law.

The superintendence of Public Vaccination in England occupied uring the whole of the year 1868 a more than ordinary share f the attention of the Lords of the Council. For on the first day f the year the new Vaccination Act, 30 & 31 Vict. c. 84, came nto operation; and, from then onwards, my Lords were con-tantly engaged in proceedings, such as the Legislature intended to e taken, for the improvement of our public vaccination in respects here the system had hitherto been at fault.

New regulations affecting contracts.

The nature of the defects which required correction had been ery fully explained in successive annual reports of this depart-ient, particularly in those from the second to the sixth in-usive; and as far back as 1859 my Lords had communicated to ie Poor Law Board, for the assistance of local authorities con-racting for public vaccination, an exposition of the broad prin-ples of arrangement on which contracts must in future be based the defects in question were to be prevented. In 1868, with ie new law, the time had come when this merely recommendatory node of dealing with very serious evils could no longer be con-dered sufficient; and my Lords accordingly saw fit to issue xpress regulations for the purpose, by an Order of Council bearing ate February 18th, 1868. Of the regulations thus issued, a copy subjoined to this Report, as Appendix No. 2. The great object as that public vaccination should no longer be so excessively sub-ivided among times and places and persons as to have needless ifficulties put in the way of its effective performance; and with is object the regulations provided, as their general effect, that the ublic vaccinator under ordinary circumstances should vaccinate nly at public stations, and at no station oftener than once a week, nd, if in a town district, only at one station therein; that no two ublic vaccinators should in any case act for one and the same istrict; and that the division of towns into vaccination districts ould not go beyond certain limits of smallness. Also, with refer-nce to section eight of the new Act, a special regulation was made, miting the extent to which re-vaccination at the public expense ight be given.

New contracts.

The new law did not abrogate any of the existing contracts or public vaccination, but it tended to make new contracts in nany cases desirable; and thus during the year new arrangements, which had to be conformed to the new law and to the regulations perating under it, and which my Lords had to consider in more r less detail, and for the most part very minutely, with the espective local authorities or with the Poor Law Board, were roposed by more than a seventh part of the entire number of

vaccination authorities of the country. The year has in this way been one of very great improvement in our system of public vaccination. Also in other and ordinary ways influences for improvement have been at work.

Ordinary inspections, and awards to vaccinators.

The systematic inspection which goes on under their Lordships' orders extended during the year to nearly half the public vaccination of England, namely, to 1,749 vaccination districts, comprised in 312 different unions or parishes: each inspection involving, first, an inquiry into the state of vaccination in the district; secondly, where requisite, a notification to the authority of defects found in the local arrangements for carrying the law into effect, and advice as to the changes required; and thirdly, in suitable cases, a recommendation of the vaccinator for reward under section five of the Vaccination Act, and in accordance with the system described in my ninth report. Of the money which Parliament had placed at their Lordships' disposal for this purpose my Lords distributed 2,753*l.* 2*s.* The number of vaccinators to whom gratuities were given was 345; namely, 129 who received first-class, and 216 who received second-class, gratuities. The gratuities of each class differed of course very considerably in money value in different vaccination-districts, just as the several contract-earnings differed. Where a public vaccinator was having so few vaccinations as to be only earning from his board of guardians some 20*s.* or 30*s.* a year, the supplementary payment by the Privy Council was necessarily quite insignificant as money, and, except that it implied an honorable recognition of service, might scarcely have seemed worth the trouble of formal transmission and acknowledgment; but, on the other hand, in many cases the payments were such as probably to be in themselves welcome additions to the often scanty stipends of the recipients. The largest aggregate payment of the year (a first-class gratuity on 2,738 vaccinations) was 136*l.* 18*s.*; the smallest (a first-class gratuity on 19 vaccinations) was only 19*s.*

Outbreaks of small-pox.

My Lords during the year had occasion to correspond specially with the guardians of the unions of Congleton, Enfield, Epping, Sheffield, Tendring, Tiverton, and Totnes, with regard to outbreaks of small-pox reported in those jurisdictions respectively.

Supply of vaccine lymph.

The applications made to this department during the year for vaccine lymph were 14,099; in answer to which were supplied as follows:—131,390 charged ivory points, 1,059 charged squares of glass, and 9,792 charged capillary tubes. Particulars as to the sources whence this lymph was derived are given in Appendix No. 1. Of the 14,099 applications, in answer to which lymph was given, 11,085 came from medical practitioners (including 1,462 poor-law medical officers) in England and Wales; 1,721 from Ireland, and 511 from Scotland; 566 from the army; 73 from the navy and emigration department; 101 from colonies, and 42 from diplomatic and other foreign services. My Lords, as usual, took means during the year to satisfy themselves as to the undiminished efficiency of the lymph which is supplied under their directions.

With reference to this branch of the service, my Lords had their attention drawn to a system which is in vogue in some parts of the continent, for maintaining continuous sources of lymph-supply for the human subject by keeping a succession of calves inoculated with the specific contagium; and their Lordships had a report prepared for them by Dr. Ballard on the arrangements which are in use abroad for this so-called "animal vaccination." Further information, however, is requisite before any final opinion can be formed on the question of making more or less use of the system for purposes of our National Vaccine Establishment; and therefore on the present occasion the subject cannot be written of in detail. Animal vaccination.

Fourteen of the twenty-two stations which are sources of lymph-supply for the National Vaccine Establishment, and also two stations which do not supply lymph for the public service, are used as educational stations under their Lordships' Order of December 1st, 1859. My Lords during the year inquired as usual into the conduct of the educational business of these stations, and received on this subject, as on the subject of the lymph-supply, a report which was entirely satisfactory. Educational status.

II.—General Sanitary Administration.

During 1868, as usual, in various cases within purview of the general sanitary laws of the country, my Lords had to communicate with the respective local authorities concerning action to be taken under those laws. The authorities thus communicated with were 50; including 14 of the special boards of the metropolis, 5 extra-metropolitan vestries, 15 boards under the Public Health and Local Government Acts, and 16 boards of guardians. In seven of the cases, local inquiry by an inspector under their Lordships' direction was deemed necessary, viz., at Walton-le-Dale in Lancashire, at Bootle in the same county, at Thetford in Norfolk, at Clifton-Hampden in Berkshire, at Barnet in Middlesex, at Luton in Bedfordshire, and at Dunstable in the same county. Occasional sanitary inquiries.

In the systematic sanitary inquiries which my Lords have for ten past years been carrying on, as to the distribution of disease in England and the circumstances by which it is regulated, there was in 1868 an almost complete pause; owing in some measure to the fact that the working power of the department was accidentally for the while much reduced; and in other part, because with the present commencing second decennium of sanitary responsibility, a new cycle of work had to be begun, and a great deal of consideration had to be given to questions of improvement of system. Systematic sanitary inquiries.

The department has, however, been indebted to Dr. Ballard, medical officer of health of the parish of Islington, for a very interesting voluntary contribution to knowledge, in the form of a report on the statistics of sickness treated at the public expense in Islington during the last 12 years; and this report by Dr. Ballard is subjoined. See App. No. 3. Sickness treated at public expense.

The only respect in which my Lords in 1868 extended their previous series of systematic inquiries as to the distribution and circumstances of disease, was an inquiry concerning the prevalence Venereal diseases in London.

Medical Officer's Report.

of venereal maladies among the poorer parts of the civil populatio in London; and for this inquiry Mr. Wagstaffe, one of their Lord ships' inspectors, collected some detailed information which is give in his subjoined report. See App. No. 4.

III.—Auxiliary Scientific Investigations.

Pathological investigations.

The pathological work of the department was continued during 1868 in both of the directions to which I referred in my las yearly volume; and details of this work are given by Dr. Sander son and Dr. Thudichum in their respective subjoined reports See App. Nos. 5 and 6. Dr. Sanderson, continuing from the pre vious year the very important investigation of tubercular disease has now succeeded in throwing new light upon a large part of tha subject-matter; and Dr. Thudichum, in the chemical field o research, has made considerable further progress in continuation o the line of 1867.

IV.—Additions to Sanitary Law.

Pharmacy Act, 1868.

An important addition to the sanitary law of the country was made last year by the passing of the Pharmacy Act, 1868. This statute is chiefly directed against evils to which I particularly drew attention in my sixth report, as attaching to the practice of pharmacy by unqualified persons, and to the too unrestricted procurability of poison for criminal purposes. The new law is to be worked by the Pharmaceutical Society, under the general sanction and supervision of my Lords of the Privy Council. It provides that in future no one shall begin any such pharmaceutical practice as involves a sale of poisons, unless he have first passed a sufficient examination in pharmaceutical knowledge; and that poisons shall not be purchaseable except with such personal identification as would probably hamper anyone who intended to make criminal use of them; and that the keeping and sale of poisons generally shall be subject to regulation under the Act. It also affirms an important principle in regard of the adulteration of drugs, by enacting that the provisions of the Adulteration of Food Act of 1860 shall be extended, mutatis mutandis, to the sale of drugs.

V.—Question of State Interference to provide for the Disinfection of Prostitutes.

Proposals to extend the operation of the Contagious Diseases Act, 1866.

The inquiry of the department into the prevalence of venereal diseases among the civil population was intended to contribute some of the elements necessary for judging a question which of late has been much agitated before the public: the question, *whether it is expedient to have in this country a systematic sanitary superintendence of prostitutes.* During the last few years, under the provisions of special Acts of Parliament—the so-called "Contagious Diseases Acts" of 1864 and 1866, a system of this sort has been administered on a small scale, by the War Office and Admiralty, at certain military and naval stations; and recently,

ile these departments have been proposing to extend their own erations with respect to the two public services which they ect, the more general question has been raised by the advocacy a voluntary association formed for the purpose of promoting extension of the Contagious Diseases Act, 1866, to the civil pulation of the United Kingdom.

Special case of Army and Navy, as distinguished from that of Civil Population.

There are here two questions which I think cannot be too ictly distinguished: the question concerning the army and vy, and the question concerning the civil population. It has t been any part of my duty to advise on the former of these estions; and I now only advert to it for the sake of greater arness in proceeding to discuss the other. It seems to me that ostitution and its attendant diseases, in their relation to the army d navy, are, in two different points of view, matter of public ncern and responsibility; first, because the military and naval rvices at their respective stations are essential determining causes prostitution, and the State, which for its own purposes keeps ose masses of male population unmarried, cannot claim to be indifferent to the result; and, secondly, because the specific diseases hich arise in that mode of life occasion so enormous a quantity of mporary disablement in the two services as to be of pecuniary imortance to the entire tax-paying community. These I apprehend re the grounds on which rests all that has yet been done by the egislature with reference to venereal diseases: grounds which are the utmost degree exceptional as regards the nature of the case: nd to argue from such a case to the case of the civil population ould manifestly be a confusion of judgment. Of the venereal iseases of the civil population, English sanitary law has not itherto taken any special cognizance; and whether this neutral tate of the law ought or ought not to be abandoned is a separate uestion, of far more intricacy than seems to be generally imagined, nd which on all accounts certainly deserves most careful conideration.

Requirements involved in proposal concerning civil population.

In proceeding to discuss this question, I may conveniently first efer to the programme of the association which I have menioned—the "Association for promoting the Extension of the Contagious Diseases Act, 1866, to the Civil Population of the United Kingdom." The Association contends "that sufferers nder any kind of [venereal] contagious disease are dangerous nembers of society, and should, so long as they are in this state, e prevented from communicating it to others; . . that ommon prostitutes should be subject to a compulsory medical xamination, and to compulsory detention in hospital as often s they are found diseased, and as long as they continue so; . that, for the reception of prostitutes suffering from venereal isease, hospital accommodation should be provided in all towns here such persons congregate."* To give a notion of the quantity f hospital accommodation which would be requisite to satisfy this rogramme, I may observe, for instance, that London is conjectured

* Report of Association, sections 2, 33, 32.

to have some 18,000 women whose living is gained by prostitution;* and that, according to one of the secretaries of the society, on any given number of prostitutes, always about one-third may be assumed to be diseased.† If, instead of insisting on these colossal estimates, we take only half their total result, the plan would require for London alone the creation and maintenance of new hospital accommodation nearly equal to that which is now given by the twelve general hospitals of London for all bodily diseases put together: accommodation, namely, for 3,000 patients. The charge of maintaining (independently of the cost of constructing) such lazarets as the above would probably be at least 100,000*l.* per annum: and their construction would probably represent a first cost little short of half a million of money: besides all which there would be the considerable annual charges for police arrangements and medical inspections. This for London alone! And the requirements of other large towns would probably be of like proportions.

And how, and by whom, to be met? and on what grounds?

Demands like the above are evidently not likely to be met by voluntary contributions. The result, if to be got at all, can only be got under action of law; and any such law, whether empowering the central government to defray expenses out of proceeds of general taxation, or empowering municipalities to assign local funds for the purpose, is, of course, in relation to minorities, compulsory. Now, it is quite certain that, rightly or wrongly, the proposed appropriation of money would, in the eyes of very large numbers of persons, be to the last degree odious and immoral. In most municipal constituencies there are swarms of persons who already find it no easy matter to satisfy the collectors of rates and taxes; they would see the prostitute kept in hospital at their expense for weeks or months, not necessarily from the exigencies of severe illness of her own, but essentially that she might be made clean for hire, lest any of her users should catch disease from her; they would remember in contrast, that for themselves wonderfully little is done by authority to protect them against adulterations of food, or against false weights or measures; and they might regard it as a strange caprice of law which should oblige them to contribute to the cost of giving an artificial security to their neighbour's looseness of life. It seems to me very important to measure beforehand the degree in which such arguments would be valid, or rather to consider on what principles (if any) the proposed intervention of law is to be justified.

Primâ facie, venereal diseases are not any concern of Government;

I suppose it may be assumed that public policy is very decidedly in favour of marriage as against promiscuous fornication; that the latter, however powerless may be laws to prevent it, is, at least, an order of things which no State would willingly foster; that, whereas it has some inherent inconveniences, among which is the liability to specific contagious maladies, such drawbacks from its attractions are not in their kind a matter for general social regret;

---

* Appendix of Assoc. Report, p. 22.

† Mr. Curgenven, on the Contagious Diseases Act of 1866, p. 7.

that venereal diseases are, in principle, infections which a man contracts at his own option, and against which he cannot in any degree claim to be protected by action of others—the less so, of course, as his option is exercised in modes of life contrary to the common good; that thus, primâ facie, the true policy of Government is to regard the prevention of venereal diseases as matter of exclusively private concern. *Caveat emptor!* And though it must be admitted that to some extent the consequences of promiscuous fornication spread beyond the persons of the original performers; the infections of the brothel being oftentimes carried into simultaneous or subsequent wedlock, and in some cases fixing their obscene brand even on the offspring of such marriages; this horrid fact is only one of many which might be cited, where innocent wives and children participate more or less severely in consequences which husbands and fathers have earned. To be wife or child of a drunkard or a gambler involves evils against which the State does not affect to give security; and, primâ facie, the dependent interest must be equally unprotected by the State against harms which that other sort of looseness may bring on it.

but this with qualification.

I am very far from thinking that the above are the sole considerations to which regard must be had in deciding such questions as the present. But they seem to me to define a position which ought not to be abandoned, except under strong compulsion of circumstances, and with reasonable prospects of success. Evidently, if venereal diseases were now the same gigantic scourge and terror which they were some 350 years ago, when they inspired Fracastoro's poem, and if curative medicine had continued as powerless against them as then: if we saw them still raging as great intractable epidemics, impeding national movements, and forcibly occupying the mind of society with all sorts of lazarous presentations: the reasons for legislative action, *provided such action could be effectual*, might be stronger than the reasons for neutrality, and considerations as to the personal ætiology of the disease might perforce have to be subordinated to the urgency of a public danger.

Medical grounds on which the proposal has to be judged:

The cardinal questions, then, are two:—First, does the detriment which venereal infections cause to the public health reach those limits at which principles generally preferable ought to be exceptionally abandoned by the State? Secondly, would the good which can be got through State interference in this matter be enough to reasonably compensate for the cost at which it would have to be attained? I must confess that I cannot with any approach to confidence answer either of these questions affirmatively. As regards the first of them, I have not the least disposition to deny that venereal affections constitute a real and great evil for the community; though I suspect that very exaggerated opinions are current as to their diffusion and malignity; but since the resources of curative medicine against them are constantly becoming stronger and stronger, it seems probable that the worst of them will year by year become less and less important (as endangering life or limb) in cases where infection may obtain. It may also be anticipated

that the greatly improved knowledge which late years have given to the medical profession with regard to the venereal contagia will spread, and not very slowly spread, through the minds of the general public, and will soon very much reduce the number of those sad cases where infected men give syphilis to their wives and offspring. On the other hand, as regards our power of preventing venereal diseases by such a superintendence of prostitution as is proposed, it is certain that no appreciable good would be got except with much organization, and at very large cost of money; and there are strong reasons for believing that the gain so purchased would, on analysis, be found to belong very predominantly to those kinds of venereal disease in which the community has little or no permanent interest.

what is the magnitude of the mischief?

First, as regards the actual quantity of venereal disease current in this country, and the importance of such disease to the public health, it is to be remembered that under the head of "venereal diseases" are included three chief sorts of disease, and of course in each sort many different degrees of severity. The three sorts to which I refer, and which in any given person are not incompatible with one another, are gonorrhœa, pseudo-syphilis, and true syphilis. *Gonorrhœa* is never even temporarily of much importance to women, nor ever, unless very exceptionally, of much permanent importance even to men; but yet thus far it is not a quite unimportant infection, that in men it is often extremely inconvenient, indeed sometimes involves for a time painful and even disabling complications, and cannot absolutely be said never to leave permanent local damage behind it. *Pseudo-Syphilis*, or so called "simple chancre," is a form of ulcer which may be of considerable local destructiveness, and is often attended by inguinal buboes, but leads to no specific ulterior consequences. *True Syphilis*, arising as "hard chancre," or in other less characteristic primary affections, involves an outbreak or successive outbreaks of so-called "secondary symptoms;" which, though almost invariably amenable to medical treatment as they arise, and probably in an immense majority of cases not of more than transient importance to the person attacked, are yet not infrequently a more or less troublesome relapsing illness, and sometimes, even in spite of treatment, a long subsequent danger to life; and this true syphilis is of permanent interest to society, partly because of the cases (though comparatively very few) in which it is intractable in the person of the original sufferer, but still more because of the indefinite duration of time for which he or she may at intervals be capable of infecting others, and because the issue of syphilitic parents is apt to perish during utero-gestation, or to be born more or less syphilitic. In seeking to estimate, without exaggeration, the harm which society suffers from venereal diseases, and the good which preventive measures may possibly effect, it is, of course, essential to observe the distinctions between the above-described three sorts of disease: above all not to use the word "venereal" as if it were synonymous with "syphilitic;" and it is also essential that whatever purports to be statistical evidence on the subject

ıould be evidence on a sufficiently large and impartial scale. 'he report of the "Association for Promoting the Extension of ıe Contagious Diseases Act to the Civil Population" gives some tatistics which might lead to an impression that in London from ne-fifth to one-third of the sick poor are suffering from "a contagious disease of the gravest character, which is constantly transmitted from parent to offspring;" but the contents of Mr. Wagstaffe's ubjoined report (App. No. 4.) satisfy me that no sufficient grounds or any such impression exist: rendering it, I think, highly probable hat, of the sick poor who at any given moment are receiving medical relief under the poor law and at dispensaries and general hospitals n London, only about 7 per cent. have venereal disease of one kind ır another, and that only in about half this proportion the form of lisease is true syphilis. Again, a piece of the experience of the Children's Hospital in Great Ormond Street, as quoted in the report of the Association, may seem to suggest that "about one-fifth" of the sick children of the poor are sick with immediate consequences of inherited syphilis; but on inquiry I find that, of 118,590 children of the poor treated during the last ten years for all sorts of diseases at the Ormond Street Hospital, the proportion recorded to have been syphilitic has been only 1½ per 100. Thus, in both cases the quantity of evil appears to be many times less than advocates of legislative interference may imagine; and it must be remembered that London probably illustrates the utmost dimensions which the evil can attain in this country.

how far is the mischief preventable?

Then, as regards the preventability of venereal diseases, even the abstract question (abstract I mean from considerations of cost) is by no means an easy one. Especially we are in want of exact discriminative information as to the good which other countries have got from their sanitary superintendence of prostitution. I believe it to be the fact that, even under strict systems of police, prostitutes in very large proportions escape the intended supervision; and that in their evasive traffic so large a dissemination of venereal diseases may be kept up as to leave in net result very little apparent success to be boasted of. Let it be assumed, however, that, in any place where circumstances are favourable, "venereal diseases" in mass may be greatly reduced under such a system: but there remains as an unfortunate accident of the case, that this reduction might least of all affect those sorts of disease in which society is incomparably most interested; and in the absence of exact records on this point, expectations ought, I think, to be very moderate. For the various local states which most habitually spread the infection of true syphilis are apt to be in themselves such slight and painless affections as almost or entirely to escape the patient's notice; and indeed in women primary syphilitic ulcers, and other local states capable of infecting with syphilis, not only very often pass unnoticed by the patient herself, but have often been overlooked in examinations made expressly for their discovery. And with reference to proposals that particular inspections of women should take place on the information of men whom they have infected, insuperable difficulties are created in the case

of true syphilis by the very long incubation-time of the primary infection: an interval generally of at least three weeks, and capable apparently of extending to six weeks or more: during which time the inoculated part presents absolutely no sign of infection; and at the end of which time the infected man may (for obvious reasons) be in utter ambiguity as to his infectress.

and with what difficulties? and at what proportionate cost?

When the question of preventing venereal diseases is considered as one of administration and finance, some of the above facts become important difficulties. It is proposed that the organization should take equal cognizance of all sorts of venereal disease: indeed this, if the organization were in existence, would seem practically inevitable; partly because of uncertainties and precariousness of diagnosis; partly because cases, taken in the order of their permanent interest to society, would very often be in inverse order to that which the relative urgency of personal sufferings would dictate. And thus, so far as the extinction of true syphilis is to be deemed the essential object of the system, the organization would in two ways tend to be disproportionately expensive: on the one hand, because expending a very large share of its strength on diseases of no permanent importance to society, and, on the other hand, in such measure as cases of true syphilis would escape the intentions of the system.—Further, when the administrative question is considered, not as national and one, but as distributed among many local authorities, a new sort of difficulty presents itself. Whatever good can be got from a sanitary superintendence of prostitution, if worked with uniform strictness through the entire country, the good will not only of course diminish, but will diminish at an immensely increasing rate of diminution, in proportion as the system is not universal and uniformly strict; so that a local expenditure which would give remunerative results, if other places were acting on the same system, might easily, in the contrary case, appear comparatively unproductive. This has been a chief point in the case of those who have pressed for an extension of the present venereal diseases law; and the Association's report has for one of its chief texts, "Free communication between localities, fatal to success of Act in limited districts."

Practical conclusions:

The broad result in my mind from the various above-stated considerations is that at present I very decidedly refrain from recommending any change in that neutral position which English law has hitherto held in regard of the venereal diseases of the civil population. So far as my present knowledge enables me to judge, I believe that any departure from that position could do little but embarrass and disappoint.

as to compulsory legislation;

That under a well-planned national system, obligatory in its local operation, and stringently directed from the centre, with an enormous establishment of lock hospitals, with prostitution universally submitted to strict methodical supervision by police, and with very frequently recurring minute surgical examination of the persons of prostitutes, a great reduction might be made in the present prevalence of venereal diseases among the civil population; and that as part of such reduction (though probably in comparison

it a small part) there would be a diminution in the prevalence of ue syphilis; these are propositions which I do not dispute; but eir very important converse has to be remembered, that, in proortion as the above conditions cannot be attained, the hope of sults becomes chimerical. The conditions, I need hardly observe, e such as there can be no reasonable present expectation of eing realized in this country: and I must add that, in the resent state of my knowledge, I could not advocate any such gislation as would even approximately fulfil them. Not only do doubt whether the evil can in any reasonable sense be said to all for the repugnant and very costly measures of prevention hich alone could pretend to be of effect against it, but also feel bound to press for something like proportion in the treatent of such matters. And recognizing how incomplete is itherto our sanitary system, and particularly how little pressure s yet put on local authorities in matters of far more general mportance to life: recognizing, for instance, that it is almost ntirely a question of private charity whether fever hospitals xist in a town, and that such hospitals are most insufficiently rovided: I cannot but think that during this state of things ompulsory legislation in the present matter would be a dispropportion not to be justified.

as to giving option to local authorities;

On the other hand I have to observe that the somewhat uncertain amount of good which very strict compulsory legisation might produce would less and less admit of being ealized, in proportion as the provisions of law were non-compulsory: and a law, giving to local authorities or populations ny considerable scope for option in the present matter would quite unquestionably be futile. Everyone knows how valueless such legislation has been in the greater part of the hitherto province of sanitary law, even as regards objects of foremost necessity to the public health; so valueless, that in all chief respects compulsory legislation has already had to be substituted for it; and the light of those experiences may be applied, mutatis mutandis, to the present extremely difficult and delicate subject matter. There probably would be detailed discussions, often indefinitely prolonged, and resulting in inharmonious conclusions, in innumerable vestries and town-councils and wardmotes; discussions which, if not to bear fruit, ought in the interests of decency to be deprecated; but of action, capable of giving success, there certainly would be little or nothing. It is true that under permissive law there have been exceptional instances of local exertion for other sanitary purposes; but even solitary instances of such exertion could not in the present matter be anticipated; for here the peculiar discouragement would exist, that no town could be sure of satisfactory results from its own superintendence of prostitution unless other towns, in communication with it, were acting upon the same system.

as to legislating for a voluntary system;

In a particular proposal, which I think it my duty to mention, permissive legislation, of a sort which would almost entirely rest on a system of voluntary contributions, has been contemplated;

and this proposal was received last year with some favour by the Committee of the House of Lords which had the Contagious Diseases Act under consideration.* The proposal, viewed in relation to its professed aim, is of course open in the very utmost degree to the objections which I have just stated generally against permissive legislation; indeed, I can scarcely conceive that, if enacted, it would in any single case be of good effect; and there is a different point of view in which I would venture to submit that its admissibility (as well as that of any permissive legislation) requires to be most cautiously considered. For it seems to me that the proposed legislation, powerless though it would be for any sanitary result, would in principle be the thin end of a wedge; that the question of its acceptance or rejection is, as precedent, of fundamental importance; that, between permissive general legislation to-day and compulsory general legislation to-morrow, there would stand but the question of expense. In courses called tentative it is so easy to drift into positions which become pledges, that I venture to press this consideration. Whether the venereal diseases of the civil population are henceforth to be deemed matter of public concern, whether the civil fornicant may reasonably look to constituted authorities to protect him in his commerce with prostitutes, is the principle which I conceive to be at stake. And I would repeat my opinion that, if that principle is affirmed, the responsibilities implied in it cannot be adequately met without stringent compulsory general legislation.

as to local Acts.

Whether particular municipalities wishing to exercise within their respective jurisdictions special powers in relation to venereal diseases might properly be let acquire such powers by purely local Acts of Parliament, is, I think, a somewhat different question; and possibly such special Acts (provided they contained proper obligatory provisions) might, in certain cases, be conceded without any sacrifice of the real principles which are at stake. Every such case would then have to be judged on its own merits. But as regards any general legislation, whether compulsory or permissive, in regard to the venereal diseases of the civil community, my conclusion is very decided that at present I cannot recommend any such legislation.

Supplementary remarks:

Finally, there are some incidental considerations to which I beg leave briefly to advert.

Prostitution, and the ways of reducing it:

Among arguments put forward to recommend a general superintendence of prostitution, there is one which seems to have gained for the proposal a considerable quantity of non-medical, particularly clerical, support. The report of the Association namely, alleges "that a collateral but not unimportant result

* I describe the financial basis of this proposal as "almost entirely" voluntary contribution. The proposal, as I understand it, is that Government should be authorized to confer the requisite police powers for sanitary superintendence of prostitution on any local authority shown to have at command (as by voluntary contributions) the proper hospital accommodation for such purposes. And the proposal seems to assume that, if lock hospitals were established by voluntary contribution, the local authority could provide (presumably from proceeds of rates) for the cost of the medical inspections and police arrangements.

hich inevitably follows the establishment of preventive mea- ures is the improvement in the moral and social condition of ie women;" and a memorial which was last year addressed) the then Lord President of the Council, by the President of ie Royal College of Physicians and others, supported the view that, of the unfortunate women who are subjected to these strictive and sanitary measures, a comparatively large propor- on have been reclaimed." I believe it to be unquestionable iat such women as have hitherto come under medical inspection ave generally been influenced by it to become cleanlier in their ersons, and that the brothels inspected by police are less apt than hey were to be scenes of riotous disorder; changes, on which no loubt the users of those persons and places may congratulate hemselves; but which cannot without extreme abuse of terms be lescribed as of any moral significance. On the other hand, the last lause of the statement cannot fail to seem morally important to nyone who accepts it without reserve. I fear, however, that such iopes as it at first sight would seem to justify, as to possible moral esults of a government superintendence of prostitution, would on iny large scale show themselves essentially delusive; not, perhaps, as egards individual reclamations to be effected, even from brothels, by ure and kindly human contact, but as regards the statistics of pro- stitution, broadly and practically considered. For I apprehend that the concubinage-market, like other markets, tends to be fed accord- ing to demand; and that, if prostitution is really to be diminished, the principles of those who would diminish it must be preventive. Of the many roots of the evil some are practically immutable, but others will undoubtedly vary with the general moral senti- ments of the time. Always, of course, there are certain large quantities of mere brute passion, forcing at any price to have their way; and always, in our present social state, there are large unin- telligent masses of human life with little sense of right and wrong, and much of abject poverty ready to sell itself for food, and even more of uneducated frivolous temperament. But if these be regarded as in my present sense "fixed" elements (though indeed all of them are happily susceptible of reduction) a comparatively very variable force is represented in the influence of public opinion. That parents of the educated classes regard with immeasurably different degrees of interest the chastity of their daughters, on the one hand, and the continence of their sons, or future sons-in-laws, on the other, is a fact which probably has its basis in a doctrine of supposed general consequences; but knowledge which is supplied in studying the venereal diseases of the civil population—a know- ledge of the mischief and misery which a young man's transient incontinence may be preparing for his whole future domestic life, certainly gives room for consideration whether these ingredients of the one case ought not to be more popularly understood. The only state of things which can be regarded as essentially antago- nistic to prostitution is the system of early marriages: which, in this respect, commends itself equally on moral and physical grounds; for, in proportion as it is accepted, the promiscuous intercourse of

the sexes ceases to excuse itself by circumstances, and the chances of venereal infection fall to the lowest level they can attain.

Hospitals for diseased prostitutes.

Also in conclusion I would beg leave (though perhaps superfluously) to protect parts of my above argument from misapprehension. In the proposals which I have had to criticise, hospitals for diseased prostitutes have not come under discussion as charitable institutions, but solely as elements in a machinery proposed to be constituted by law for giving an artificial security to promiscuous fornication. In the latter sense I may have seemed indifferent to their existence; but in the other sense, if this occasion permitted, I would willingly plead in their favour. For some thirty-five years of hospital-surgery in London have given me the amplest opportunities of knowing what physical miseries (as well as what worse mental states) attach to the career of prostitutes; and in this point of view I cordially agree with those persons who deplore the extreme insufficiency of hospital accommodation provided among us for prostitutes venereally diseased. The defect may not be for legal remedy, but not the less it is real, and I sincerely hope it may be dealt with by agencies appropriate to its nature. Such are not for me here to discuss. But considering how large a proportion of society has responsibilities of causation or connivance in that sphere of suffering and shame, and considering again what case for compassion even those who are purest from such responsibilities may recognize in states of human life so estranged and so bitterly punished, I should suppose that dictates of justice on the one side, and impulses of charity on the other, would respond, and not parsimoniously, to any well-considered appeal in the matter.

VI.—Question of consolidating and bringing into System the Laws and Administrative Agencies which concern the Public Health.

I have stated that during the past year much consideration has had to be given in this department to *questions of improvement of system* in the laws and legally constituted machinery which purport to provide for the public health of the country: and it may be convenient that in this place I briefly state my experience of the present system, and my opinion of the reforms which are wanted in it.

Spirit of the present sanitary laws.

It would, I think, be difficult to over-estimate, in one most important point of view, the progress which during the last few years has been made in sanitary legislation. The principles now affirmed in our statute-book are such as, if carried into full effect would soon reduce to quite insignificant amount our present very large proportions of preventable disease. It is the almost completely expressed intention of our law that all such states of property and all such modes of personal action or inaction as may be of danger to the public health should be brought within scope of summary procedure and prevention. Large powers have been given to local authorities, and obligation expressly imposed o

hem, as regards their respective districts, to suppress all kinds of nuisance, and to provide all such works and establishments as the public health primarily requires; while auxiliary powers have been given, for more or less optional exercise, in matters deemed of less han primary importance to health; as for baths and wash-houses, common lodging-houses, labourers' lodging-houses, recreation grounds, disinfection-places, hospitals, dead-houses, burial-grounds, &c. And in the interests of health the State has not only, as above, limited the freedom of persons and property in certain common respects: it has also intervened in many special relations. It has interfered between parent and child, not only in imposing limitation on industrial uses of children, but also to the extent of requiring that children shall not be left unvaccinated. It has interfered between employer and employed, to the extent of insisting, in the interests of the latter, that certain sanitary claims shall be fulfilled in all places of industrial occupation. It has interfered between vendor and purchaser; has put restrictions on the sale and purchase of poisons, has prohibited in certain cases certain commercial supplies of water, and has made it a public offence to sell adulterated food or drink or medicine, or to offer for sale any meat unfit for human food. Its care for the treatment of disease has not been unconditionally limited to treating at the public expense such sickness as may accompany destitution: it has provided that in any sort of epidemic emergency organized medical assistance, not peculiarly for paupers, may be required of local authorities; and in the same spirit it requires that vaccination at the public cost shall be given gratuitously to every claimant. The above survey might easily be extended by referring to statutes which are only of partial or indirect or subordinate interest to human health; but, such as it is, it shows beyond question that the Legislature regards the health of the people as an interest not less national than personal, and has intended to guard it with all practicable securities against trespasses, casualties, neglects and frauds.

The intentions frustrated in detail:

If, however, we turn from contemplating the intentions of the Legislature to consider the degree in which they are realized, the contrast is curiously great. Not only have permissive enactments remained for the most part unapplied in places where their application has been desirable: not only have various optional constructions and organizations which would have conduced to physical well-being, and which such enactments were designed to facilitate, remained in an immense majority of cases unbegun; but even nuisances which the law imperatively declares intolerable have, on an enormous scale, been suffered to continue; while diseases which mainly represent the inoperativeness of nuisance-law have still been occasioning, I believe, fully a fourth part of the entire mortality of the country. And when inquiry is made into the meaning of this strange unprogressiveness in reforms intended and in great part commanded by the Legislature, the explanation is not far to seek. Its essence is in the form, or perhaps I may rather say the formlessness, of the law. No doubt there are here and there other faults. But the essential fault is that laws which

ought to be in the utmost possible degree simple, coherent and intelligible, are often, in nearly the utmost possible degree, complex, disjointed and obscure. Authorities and persons wishing to give them effect may often find almost insuperable difficulties in their way; and authorities and persons with contrary disposition can scarcely fail to find excuse or impunity for any amount of malfeasance or evasion.

and how?

The many mere ambiguities and minor oversights of the law need not here be insisted on; for the broad jurisdictional state of the case is in itself enough to account for miscarriage.

Local authorities: in common health-areas:

Except where special health-areas have been constituted under local Acts of Parliament, or under the Public Health and Local Government Acts, the local administration of the nuisance-law in regard of its most rudimentary objects is not vested in one single authority for each place, but is distributed, with very disputable demarcation-line, between two. And as regards the distribution of voluntary improvement-powers in such places, there may be one authority for common lodging-houses, another for labouring classes lodging-houses, another for baths and wash-houses, another for burials; and all these authorities separate from the two authorities which have to do with nuisances and drainage and water supply, and from the authority which has to do with highways.

in special health-areas.

It is true that, where special health-areas exist, matters are on a better footing as regards the consolidation of nuisance-powers and improvement-powers in the hands of the town-council, improvement commission or local board: but just in these cases a new kind of evil crops up: for, except by accidental coincidence, these special health-areas do not form units of area in the population-statistics of the country: and it consequently very often occurs that these districts (which peculiarly might be expected to be able to show an intelligible balance-sheet in regard of their expenditure of life) have really no separate statistics even of their births and deaths. Also these special health-areas have not, except sometimes accidentally, any relation whatever to the areas of poor-law relief; and a medical officer of health acting for the health-authority of the town has no official relations with the medical attendants of the sick poor.

Central authorities.

Then (secondly) as regards central jurisdiction in nuisance-law and kindred matters, the conditions are equally unmethodical. Proceedings which stand to one another in the relation of first and second stages of legal intention are the responsibilities of two different chief ministries: on the one hand, inspectional and admonitory proceedings, such as my Lords of the Council direct through this department, in relation to local excesses of disease, and their causes; and, on the other hand, coercive proceedings, which the Secretary of State is empowered to take, in regard of defaulting nuisance-authorities: proceedings of the latter sort being hardly conceivable except on foundation of proceedings of the former sort. This of course is no insuperable difficulty; for the departments concerned can easily adjust their boundary line; but unfortunately in our sanitary code there are other and less superable wants of method. The essential responsibility

or superintending the state of the public health is integrally vested in the Lords of the Council; but fragments of co-ordinate responsibility in the same subject-matter are also vested (for purposes more or less special) in the Home Secretary and in the Board of Trade; and thus one given subject-matter may be under consideration in two or even three Government offices, and each of these offices be required to communicate with the public concerning it.

Relations of Government to localities.

Thirdly, as regards the relations between central and local authorities, a very unfortunate state of things is represented in the absence of certain lines of communication. Government is supposed to supervise the state of the public health: but Government may remain for long periods of time uninformed even of extremely important local outbreaks of disease. This is constantly happening with regard to typhoid fever and other nuisance-diseases of the country; and a very suggestive illustration of the fact is, that, when diphtheria was first beginning to re-appear on a large scale in this country after an interval during which the medical profession had lost all memory of it, very fatal local epidemics of what seemed a new disease were going on for two years (1855–7) in various parts of England, with the central authority of the country absolutely unapprised of the fact. In this connexion too it deserves notice, both as a matter affecting the relations of central to local jurisdictions, and indeed also as affecting the efficiency of the local authorities themselves, that, with regard to some essential elements for proper judgment as to the health of districts, the law does not even provide for the knowledge being systematically in existence. It provides, no doubt, that causes of death shall be registered; but no provision is made that the causes shall have been medically certified; and to my knowledge it has happened in regard of whole counties that, through the general absence of proper medical certificates, with the accompanying misuse of medical language by lay certifiers of death, very deceptive impressions have been given as to the local prevalence of particular diseases. A similar fault of system is shewn in the fact that no available medical returns are made of sickness locally treated at the public expense. Nor, I need hardly add, are any such returns made as to the sickness treated by our innumerable quasi-public medical charities.

Causes of the chaotic state of law.

It would be useless, though not difficult, to explain in detail how the above-described unsatisfactory state of law has come to exist. Broadly it represents two sets of causes. On the one hand, the legislature in all these matters has evidently meant to proceed very cautiously and tentatively; and the many successive stages of attempt, while co-apparent in the statute-book, show of course a good deal of awkward piecing and overlapping, and probably more or less of accidental inconsistency, as well as a certain quantity of ground not yet covered by legislation. On the other hand, the impulses to legislation have come from many different quarters, including two or three departments of Government; and simplifications and coherency of result, such as might have been attained if all had originated from or converged to a single chief ministry for

the subject-matter, are merits which, from the nature of the case, could not be expected.

Remedial legislation.

I venture to submit for consideration whether now the time has not come when a better state of things than I have described can be, and ought to be, constructed. For in regard of some very considerable parts of sanitary legislation, including the machinery by which effect is to be given to the law, the purposes of tentative proceeding have now, I apprehend, been amply fulfilled; and there exists undoubtedly a very urgent public need, that the intentions of the legislature in the present most important subject-matter should as soon as possible, and as completely as possible, be embodied, intelligibly and harmoniously, in clear consolidating law. In contribution to this result I avail myself here of the opportunity to submit some suggestions as to what, in my opinion, are the chief objects for endeavour, and what the broad outlines of such system as might easily be attained, for sanitary government in England.

Nuisance law:

A. That the nuisance-law of England (using the word *nuisance* in its largest sanitary sense) should be put on a satisfactory footing, as regards authorities and areas of jurisdiction, seems to me the first object to be aimed at; and the opportunity would probably be found convenient for making also some extensions which are wanted as regards the scope or object-matter of the present law. Of the chief objects which I think desirable under these heads, the following is a more particular statement:—

to be consolidated with local improvement law:

a. I think it essential that the separation which recent Sewage Utilization Acts have established between nuisance-authorities and sewer-authorities should cease; that every nuisance-authority should also be sewer-authority in the fullest sense of the word: that in the hands of this consolidated health-authority should also be vested all such powers as now attach to several different authorities and corporations for purposes of local improvements and inspections in the physical interests of the people, in regard of burial grounds, baths and wash-houses, labourers' dwellings, common lodging-houses, recreation-grounds, paving, lighting, &c.

jurisdiction in special health-areas:

b. That cities and towns with developed municipal government should constitute special health-areas, having as health-authorities their respective town-councils, improvement commissioners, or other local boards, is a present state of law which of course would be continued: and the utmost facilities ought also, in my opinion, to be given (akin to those which the Local Government Act now gives) for the creation of new special health-areas, and for the variation of existing special boundaries, where required by local conditions. It seems probable that ports and harbours, with all shipping contained in them, must at least to some extent be regarded as special health-areas, having the harbour-authority for health-authority; and, if so, that, for cases where it would be convenient, the harbour-authority might be empowered to appoint some permanent officer to act as health-authority in its stead.

in ports:

in common health-areas.

c. As regards places not constituted special health-areas, choice has to be made between several courses; and the one which on the whole

think has great balance of advantages in its favour is that of consistently adhering to the intentions of Mr. Lowe's Nuisance Act of 1860, by letting the common health-areas be the union-areas of poor-law jurisdiction, and identifying the common health-authorities with the common destitution-authorities of the country. The poor-law division of the country is a long-accomplished and locally well-known division, which furnishes limits to many local relations, and, not least, fixes the Registrar-General's "districts" for statistics of population and births and deaths: every union has its administrative board, presumably of the best sort which the area can be expected to give for any purpose of local government, and carefully constituted on the double basis of rate-paying suffrage and ex-officio qualification, and moreover so constituted that each parish of the union is represented in it: and this authority has its fixed meeting-place and meeting-times: it has its permanent clerk, qualified in law: and it has, always acting in detail over the whole union-area, as visitors of the poor and their dwellings, a staff of other permanent officers, medical and non-medical. No approach to such organization as this exists for any other purpose in the rural districts of the country; and it would seem to me a simpler and safer course to bring the common health-service of the country within scope of that existing organization than to attempt a differently planned organization for objects exclusively of health. Among plans which may be conceived as alternatives to the above, it might be proposed to revert to some such parochial system as that of Sir Benjamin Hall's Nuisance Act of 1855, or to develop the parochial system of Sir George Grey's Sewage Utilization Act of 1865; but any parochial system, if not to be utterly abortive, would have to provide for the constitution of boards and offices for each parish with an elaborateness which would often seem most disproportionate; and the result when obtained would be a jurisdictional system conterminous with little except the system of church-rates. Other sorts of plan might aim at establishing a system of county-boards, with some sub-scheme, perhaps of descending scale, for smaller (say, at last parochial) sub-jurisdictions; but here again the law would fail, unless it provided for the boards and officers of the sub-jurisdictions; and all this apparatus, because of its novelty, would have to be planned so minutely, as compared with the actual work to be done in each rural sub-jurisdiction, that it could scarcely not seem excessive and pedantic. And in any of these alternative plans there would be difficulty in avoiding what, if it occurred, would be matter for extreme regret, an entire dissociation of the local health-machinery from that universal system of medical attendance which exists for purposes of the poor-law.

Relation of health-authority to authority for destitution: in common health-areas:

d. If, however, the common health-areas of the country are to be the areas of poor-law unions, and the local authorities acting for destitution are to be the local authorities acting for health, there are three conditions which I think ought to be observed. First, regard being had to the great extent of most rural unions, and to various other considerations, it is peculiarly necessary that

the authority should be well empowered to act through committees, both for divisions of district and for divisions of subject-matter; and probably it would be convenient that such committees should be able to include persons not members of the original board. Secondly, regard being had to the frequency with which neighbouring districts have joint interest in questions, as particularly of drainage and the like, each authority ought to have facilities, and in certain cases obligation, to combine for particular purposes, by committee or in entirety, with other neighbouring authorities. Thirdly, I think it scarcely less than essential that any law which connects for local administration the two services of health and poor-law relief should do so in a different form to that of the law now in force. At present in all common health-areas of the country the board of guardians of the poor is the nuisance-authority; but it is so *ex officio;* and this peculiar form of law not only gives to the health-interests of the place an undue appearance of being of secondary importance, but also sometimes leads the guardians to think themselves surcharged with duties foreign to their real business. It seems to me highly desirable that, if the two administrations are to be associated, the board should be appointed, *ab initio*, expressly for the compound purpose, and should be invested by law with a new title denoting its double functions as authority for health and destitution.

In special health-areas.

e. Within almost all special health-areas of the country the health-authority is, and I must assume will for the present continue to be, distinct from the destitution-authority of the place. I accept this as fact, but I doubt if it is to be deemed an advantage. I suspect it would generally be of benefit to municipal administration if one single board, with sufficient power of acting by committee, were elected for all purposes of local government, including the relief of destitution.

Local medical services under health-law.

f. As regards certain medical services to be locally rendered in aid of health-authorities as such, I think, first, that every health-authority should be empowered to appoint a special health-officer; secondly, that wherever there is a special health-area the appointment of a special health-officer should be imperative; thirdly, that for areas where the destitution-authority is also the health-authority, the rule ought to be that, if no special health-officer is appointed, each medical officer acting under the destitution-authority should be deemed health-officer within the limits of his own medical relief district.* I think it indispensable that everywhere throughout the country there should be an officer to whom the local authorities and the public may look for those definite occasional acts of inspection and certification which an amended health-law would certainly require from time to time to be executed, and to some of which I shall hereafter refer; but it is obvious that

* For brevity, I use the word "health-officer" without qualification: but I may observe that the functions for which I am here proposing to provide universally are only such few rudimentary functions as attach to a minor health-officer, and that the question of superintendent health-officers, acting for counties or other large areas, is one on which I do not at present enter.

in many of the common health-areas of the country occasions for this sort of action would be so few that probably the services might best be paid by fees. In all important special health-areas, on the other hand, the services would be more or less continuous; but it could only be in some very few cases that the duties of the health-officer in a single health-area would represent entire occupation of his time; and therefore, for other cases, it seems to me greatly to be desired, with a view to procuring proper cultivation of the required medical accomplishments, that the special health-officer of one town should be free to be special health-officer to another; and that the two parties concerned should so avail themselves of this freedom that the special health-officer might be able to dispense with ordinary professional practice, and that the towns employing him might be able to secure a very high quality of special service.

Extension of legal definitio of "nuisance.

g. The system of summary procedure which is the essence of our modern nuisance-law (subject, of course, in certain cases to appeal to a superior court) ought in my opinion to be extended as far as practicable to all influences by which the public health is endangered, and the word "nuisance" for the purposes of the law to be applied to every such influence. Especially, it seems to me, that all such pollutions and obstructions of streams as may be of ill consequence to the public health ought to fall within the law of nuisance.

Regulation against recurrent nuisance

h. With regard to all such sorts of nuisance as are likely to be recurrent or habitual, the central authority, and with its consent local authorities, ought, I think, to be able to make regulations and to affix penalty to breaches of them.

Proceedings.

i. All proceedings under the nuisance-law might, I believe, with advantage be open indifferently to any person aggrieved, and to the local authority, and to the central authority.

Other conterminous medical responsibilities:

B. Two very important medical responsibilities, not arising under the nuisance-law, nor under the poor-law, but created by special Acts of Parliament, have at present to be discharged, the one entirely, and the other almost entirely, by the respective destitution-authorities of unions and parishes, viz., first, public vaccination, and, secondly, medical relief in epidemic emergencies.

public vaccination:

a. The authority for public vaccination is now universally the destitution-authority, which in all common health-areas is identical with the nuisance-authority, but in all special health-areas is separate from it. Under the system I am suggesting, public vaccination in the common health-areas would remain substantially unchanged; it would be one of the health-functions of the double-functioned local authority; but as regards special health-areas, it would certainly admit of question whether public vaccination ought not rather to be a function of the consolidated health-authority than a function of the authority for destitution; and I am myself disposed to think that in those areas the transfer would generally be desirable.

action under Diseases Prevention Act.

b. Exceptional medical relief in epidemic emergencies (as requirable under the Diseases Prevention Act) is so essentially a

mere temporary increase of the ordinary medical relief of the poor, that I think it ought always to be a function of the authority which administers the ordinary relief. Thus, under present poor-law, the function would everywhere attach to the destitution-authority of the place. With regard to special health-areas, where almost universally the destitution-authority and health-authority are mutually independent bodies, the law ought to take security for all necessary co-operation of the two sets of officers; and this not only when the Diseases Prevention Act is in operation, but equally as to all ordinary relations between the preventive and curative jurisdictions.

Local medical functions attributable over larger areas.

C. Beyond the purview of such laws as I have yet spoken of, very important sanitary objects yet remain to be provided for by some sort of local administration. Such are the protection of the public against sale of adulterated and damaged food, and against malpractices of water-companies, and against offences under the Pharmacy Act; proceedings as to the diseases, especially the contagious diseases, of domestic animals; provision of skilled assistance to local magistrates when crimes against life are imputed, &c. As regards all these matters, some distinctive principles are involved, making it in my opinion for various reasons inexpedient that here the local authorities should be such as have hitherto been under consideration. One immensely important group of functions under the present head is to protect the public health against various kinds of commercial wrong; and if powers for this purpose are to be strongly and impartially exercised, it would seem desirable, first, that the areas of jurisdiction should be as large as conveniently may be, and then that the empowered authorities should rather be of magisterial type than consist of boards constituted by annual popular election. Probably the magistracy of boroughs and counties, as represented in courts of quarter-session, would be the best local authority in the matter; and it might, I submit, be required of each of these courts to appoint a public analyst, with definite duties under the adulteration laws, and with reference to public supplies of water, and various like matters. It seems to me that, for all health-matters not in the hands of nuisance-authorities or destitution-authorities, an uniform constitution of authority on this magisterial basis might very conveniently be provided; bringing more or less completely into one system the local supervision of branches of trade which concern life, and the local supervision of cattle diseases, and the local supervision of lunatic asylums, and local arrangements for providing skilled evidence in aid of coroners' inquests.

On the present occasion my subject-matter consists so especially of questions of method and organization, that I must here pass without mention many points where the law seems to me in other respects to require amendment; but I may observe in passing, that many of the most important objects which I propose should be matters of quarter-sessions authority are hitherto very imperfectly provided for by law.

D. For certain cases where public health is in question, the central authority is authorized by law to issue orders and regulations which, when issued, have the force of law in relation to the local authorities addressed. And in certain other cases the right of local authorities to take particular courses of action is by law made contingent on the central authority's giving approval to such courses. What ought to be the precise extent of the discretional control to be thus exercised by central authority in local affairs is not a question which needs here be discussed; but the number of cases which statute-law cannot touch in exact terms is so great, that manifestly, if such law is to work with promptitude and ease, it must, to a greater or less extent, be supplemented by that elastic margin of what may be called law in reserve.

Central authority in regard to regulations and sanctions.

E. The ordinary administrative relations which the law supposes to exist between local authorities and central authority in relation to the public health are in substance two:

Ordinary relations between central and local authorities.

first, that the central authority watches the fluctuations of health in all the health-areas of the country respectively;

and, secondly, that, discovering from indications thus supplied the cases where health-law is not properly administered, it takes steps, which in the last resort may be coercive of local authorities, to procure proper obedience to the law.

The extent to which the law imposes definite obligations on local authorities assigns of course a limit to the central authority as regards the class of cases where its coercive interference is possible; but far beyond that limit, as well as also within it, innumerable cases present themselves, where mere information and advice from the central authority may be influences of the utmost value in determining local authorities to right measures for the public health. It is manifest that functions of this sort cannot be exercised by any central authority except in proportion as it is cognizant of local variations in the public health: proper provisions for making all such variations known to the central authority are therefore elementary necessities in that mixed system of central and local government which the law has intended to operate for sanitary purposes in England: and greatly to improve the provisions which now exist in this country for recording and reporting the deaths and sickness of the community, is, in my opinion, an object of quite fundamental importance among such improvements of method as I am considering. The chief points where I think amendment wanted for purposes of general administration are as follows:

a. With regard to the knowledge which ought to be had concerning the deaths of the population, I have three suggestions to make.

Knowledge of deaths to be made available

First, in my opinion, the law ought as far as practicable to require in every case of death that the cause of the death be medically certified. Exception, not in substance but in form, might have to be made for cases where coroners' inquests are held; *i.e.*, the verdict of any such inquest must of course be understood to include the substance of any required medical certificate. And

medical certificates:

possibly, for very exceptional circumstances, it might be desirable to provide that, in them, any magistrate's order should exonerate from the necessity of the certificate. But, subject only to such qualifications as these, it seems to me that in all cases of death a medical certificate of the cause of death ought to be required; a certificate to be obtained, where practicable, from the medical practitioner who attended the fatal illness; or, where there has been no medical attendant, or none from whom a certificate can be obtained, from the public health-officer of the district.

local distribution;

Secondly, I think it essential that the division of the country for purposes of census and registration of births and deaths should, as far as practicable, treat as separate districts or sub-districts all areas which are separately identified for purposes of health-administration. New special health-areas are constantly in course of formation under the Local Government Act, and perhaps otherwise; and I would suggest that, as soon as possible after the formation of any such special health-district, it should be created a district or sub-district for purposes of registration and census.

statistical returns.

Thirdly, I refer with admiration to the detailed numerical statement which the Registrar General issues every Tuesday on the subject of the deaths of the metropolis during the last preceding week: a statement which relates to three millions of population occupying 137 separate sub-districts, and which not only gives the gross number of deaths for each sub-district respectively, but distinguishes also for each sub-district the more important causes of death; so that persons interested in the health-administration of London are able at a glance to see, with considerable minuteness, in what parts of London each of the principal zymotic diseases has been fatal during the previous week, and what number of deaths in each sub-district each such disease has produced. If what is thus done every week for about a seventh part of the population of England could be done for the whole population, not every week, but every quarter, this quarterly publication would represent one of the most important aids which could be rendered to the health-administration of the country. The present quarterly returns of the Registrar General state what gross number of deaths has occurred in each registration-district of the country; and a few of the sub-district registrars comply with a request which the Registrar General has during some years past made to all of them for "notes" on the prevalence of particular diseases in their sub-districts. But not even an approximative opinion as to the distribution of disease in the country can be formed from these imperfect and uncertain materials; and it is not till nearly two years later that the detailed results of the registration of deaths can be gathered from the annual reports of the Registrar General. A system of quarterly death-reports for the entire country, in general conformity with the weekly death-reports which are given for London, is therefore among the amendments for which I hope.

Knowledge of sickness to be made available.

b. With regard to the knowledge which ought to be had concerning the sickness of the population, I think that, greatly for immediate purposes of medical science and health-administration, and in an even higher degree for common purposes of public

economy, certain broad information ought periodically to be given as to the quantities and kinds of sickness treated by the several destitution-authorities and by the several medical charities of the country. As regards the former, it would seem desirable that at fixed intervals (say quarterly) each destitution-authority should state in a fixed tabular form, for each of its medical relief districts, what numbers of cases of disease generally, and of a few of the more important epidemic diseases individually, had been remaining under treatment at the commencement of the period; and what numbers had been remaining at the end; and what numbers of new cases had come under treatment during the period; and what number of deaths had occurred among new cases and old cases respectively. And as regards medical charities, I venture to suggest that, in the rightly understood interests of their subscribers, no less than for other ends to which I have referred, a system of uniform registration, and an uniform contribution of annual returns, ought to be claimable from them by the central authority, in reference to the sexes, ages, numbers, and kinds of cases treated by them respectively, and to the duration and results of treatment.

Medical Officer's Report.

F. That any central offices which have to do with sanitary affairs ought, like the local authorities and jurisdictions, to be methodically related to each other and to the public, on some simple consistent plan, according to their respective subject-matters, is of course indisputable: but this section of the argument does not here require at my hands more than a few explanatory remarks. If the present central offices which are more or less concerned in the question be regarded according to their main intentions, and therefore without reference to such minor flaws and uncertainties of jurisdiction as any consolidated law would at once rectify, the following may be taken as their scheme.

Central authority.

a. The functions which my Lords of the Privy Council exercise through their Medical Officer, and for which the Medical Department of the Council Office is constituted under the Public Health Act, 1858, are the essentially sanitary functions of Government: such as the following:

Lords of the Council.

to take practical cognizance of all important faults and fluctuations of the public health, general or local; looking at each such fault or fluctuation as a question of cause and effect, and examining for the common interests whether in each suffering or endangered place everything is done which ought to be done in prevention of the beginnings or spreadings of disease; and thus and from other points of view to act in supervision of all local health-authorities as such, and to give them such advice or to adopt such other measures as the circumstances in each case may shew necessary;

to provide an office of reference and appeal for local authorities and for the people generally on all considerable sanitary influences operating in the country, and on all other public questions of causation and prevention of disease, so far as the knowledge of the time enables such questions to be answered, an office in which scientific knowledge of this sort shall be

systematically gathered and reported for public use, and in which, so far as practicable, such knowledge shall be increased from year to year by special scientific investigations;

to issue, and afterwards to superintend in operation, such orders, regulations and sanctions, as the Government with medical advice sees fit, in relation to various special matters which the Legislature has made subject to this control: as local provision against epidemics, performance of public vaccination, questions as to practice of pharmacy and sale of poisons, questions as to the medical profession, &c.

Home Office.

b. There are two offices which, by a part of their subject-matter, have close, though not extensive, relation to the Medical Department of the Council Office; two offices, namely, which both are under direction of Her Majesty's Home Secretary of State. On the one hand there is the great arithmetical office, over which the Registrar-General presides: the office to which the public looks for all numerical information obtained by periodical census and from local registers, as to the numbers, ages, sexes, birth-places, industries, and family-combinations of the people, and as to the marriages, births and deaths, which take place amongst them: and I need hardly observe that one part of this statistical information constitutes an indispensable basis for some proceedings in the Medical Department. On the other hand, there is the office through which the Secretary of State, under authority of the Local Government Act, controls the exercise of rating and borrowing powers for purposes of local improvement under the Act, and, incidentally to this control, has before him for skilled criticism the various proposals of local authorities for drainage, sewage-utilization, &c. And as this office (essentially including a staff of engineers) has been found the most convenient machinery through which the Secretary of State can advise, and in case of need enforce, in regard of localities, certain constructional improvements which may be needful for the health of the inhabitants, so, in the particular cases where necessities of this sort are in question, the action of Government may be considered as consisting of two stages: the first conducted in this department of the Council Office, and the second conducted in the local improvement office of the Home Secretary. This department then, which is essentially medical, has an important point of contact with each of those two non-medical offices: but the three subject-matters, in their main extent, are necessarily separate for administration. Whether the three offices ought still to remain as now divided under two chief ministers, or might more conveniently be all made subject to one, and, if so, to which one, are questions which of course involve many other considerations than those on which it is my province to enter. I am however permitted to state that these questions, with others relating to the distribution of central sanitary work, are at present being considered by the Ministers whose departments they specially concern.

JOHN SIMON.

APPENDIX.

No. 1.—Statistics of the National Vaccine Establishment, and Educational Vaccinating Stations.

1. Staff at end of 1868.

N.B.—The Stations named in *italics* are Educational Vaccinating Stations, authorized by the Lords of the Privy Council, for the purposes of their Lordships' Order of December 1, 1859.

	Names.	Vaccinating Stations.	Days and Hours of Attendance.
Vaccinators supplying lymph for the public service and salaried from the Parliamentary Grant.	1. Mr. John N. Tomkins, *Inspector.*	Fitzroy Street.	Daily, 10—11.
	2. Mr. J. F. Marson -	*Surrey Chapel.*	Tuesd., Thursd.; 1—2.
	3. Mr. G. L. Cooper -	Battle Bridge.	Tuesday; 12—1.
	4. Dr. R. Sharpe -	Bermondsey.	Tuesday; 10—11
	5. Mr. R. Wade -	Dean Street, Soho.	Monday; 9—11.
	6. Mr. A. B. Macann -	King Street, Portman Square.	Monday; 10—11.
	7. Mr. Wm. J. Lewis -	Spital Square.	Monday; 10—11.
	8. Mr. Wm. J. Lewis -	*Wellclose Square.*	Tuesday; 9—11.
	9. Mr. W. E. G. Pearse	*Tottenham Court Chapel.*	Mond., Wednesd.; 1-2.
Parochial and other Vaccinators not salaried from the Parliamentary Grant, but furnishing Lymph at a fixed rate of payment.	1. Mr. Ellis S. Guest -	*Manchester.*	Monday; 2—4.
	2. Dr. G. F. De la Cour	*Birmingham.*	Monday; 10—12.
	3. Dr. H.A.P.Robertson	*Bristol.*	Tuesday; 11—12.
	4. Mr. A. B. Steele - / Mr. J. H. Wilson - / Mr. John Fenton -	*Liverpool.*	Monday; 9. / Friday; 2.
	5. Dr. E. L. Webb -	*Pimlico.*	Monday; 10—12.
	6. Mr. G. C. Gilchrist -	*Newcastle-on-Tyne.*	Tuesday; 2—3.
	7. Mr. W. E. G. Pearse	*Westminster.*	Monday; 9—11.
	8. Mr. J. G. Gerrans -	*Marylebone.*	Monday; 10—11.
	9. Mr. Frederick Holmes	*Leeds.*	Tuesday; 3¼.
	10. Dr. Edward Lynes -	Coventry.	Monday; 12—2.
	11. Mr. Joseph Teale -	Salford.	Thursday; 2½.
	12. Dr. James Dunlop -	*Glasgow.*	Monday; 12—1.
	13. Mr. C. Harriot Roper	*Exeter*	Thursday; 3.
Teachers of Vaccination not supplying lymph.	1. Mr. Robt. W. Dunn	*Strand.*	Monday; 10.
	2. Dr. W. Husband -	*Edinburgh* - -	Wed., Sat.; 12.

1868 - -	16,092	173	226,825

No. 2.—Further Regulations by the Lords of the Council securing the efficient performance of Public Vaccination, and respect of the Re-Vaccination of persons who apply to be vaccinated, made and issued February 18th, 1868.

I.—*Places and Times for Vaccination under Contract.*

Public Vaccinator, under ordinary circumstances, to vaccinate only at public Stations;

1. Except where the Privy Council, for reasons brought to its not sees fit in regard of any particular district to sanction a system of do ciliary vaccination, every vaccination-district shall have in it at le one public station appointed for the performance of the vaccinati under contract; and where any such station has been provided fo district, no person resident within two miles thereof, and not being inmate of the workhouse, shall be vaccinated under contract elsewh than at such station, unless the vaccinator in the particular case be opinion (which, if so, he is hereby required to note in his register) th for some special reason, the person whom he purposes to vaccinate can properly be vaccinated at the station.

and not oftener than once weekly;

2. Except under special authorization from the Privy Council aforesaid, or in so far as may be expedient at times when there is imm diate danger of small-pox, vaccination under contract shall not appointed to be performed at any station oftener than once a week.

and, if in a town-district, only at one Station therein.

3. And in any future contract concerning a vaccination dist which is partly or wholly within a town, there shall not, except un special authorization as aforesaid, be appointed within the town m than a single station for the performance of the vaccinations of district.

II.—*Vaccination Districts in Towns.*

Limitation as regards Towns, on the Smallness of Districts for Vaccination.

No part of the metropolis, or of any city, or municipal borough town corporate, or other town, shall, in respect of any future contr form by itself, or with any rural place, a separate district for vaccinat except with the approval of the Privy Council, unless it contain estimated population of at least 25,000 persons, or else be as much the metropolis, city, borough, or town, as is for purposes of vaccina under the control of one board of guardians.

III.—*Office of Public Vaccinator.*

Each District to have its own Public Vaccinator.

After the expiration of the month of June next, no two or m persons shall be allowed to act severally as vaccinators under contrac any one and the same part or district of any union or parish.

IV.—*Re-Vaccination.*

Extent to which Re-Vaccination at public expense may be given.

The performance of re-vaccination by the public vaccinator on per applying to him for that purpose shall be limited in each case by following conditions: (1) that, so far as the public vaccinator can as tain, the applicant has attained the age of 15 years, or, if during immediate danger of small-pox, the age of 12 years, and has not be been successfully re-vaccinated; and (2) that, in the public vaccina judgment, the proposed re-vaccination is not for any sufficient me reason undesirable; and (3) that the public vaccinator can a vaccine lymph for the purpose without in any degree postponing claims which are made on him for the performance of primary vaccin in his district.

No. 3.—Report by Dr. Edward Ballard, Medical Officer of Health for Islington, on the Results of an Analysis of Records of Sickness kept in Islington during the 12 years 1857 to 1868 inclusive.

The 26 diagrams represent the fluctuations, week by week, of the more important elements of weather during a period of 12 years, namely from 1857 to 1868, inclusive, together with the variations in the amount of general sickness, and of certain important special forms of sickness, as obtained from records of new cases of disease admitted for treatment in certain institutions where the sick poor are treated in the parish of St. Mary, Islington. The record of weather employed in the construction of the diagrams is that published in the weekly returns of the Registrar General. The parish of Islington is one of the most rapidly increasing parishes in the metropolis. In 1851 the population amounted to 95,329 persons; in 1868 it could not be calculated at less than 200,000. This rapid increase must be taken into account by anyone comparing the diagrams of one year with those of another. The diagrams for the first three years, again, are constructed from the records of the parochial workhouse, and the infant poorhouse, together with those kept by eight medical officers attending sick paupers out of doors, and at the Holloway Dispensary. In 1860 the Islington Dispensary began to keep a record of their new cases of sickness, and from that year forward this institution is included in the diagrams. Beside the variations in the admissions of new cases of sickness generally, I have marked those of respiratory diseases (bronchitis and catarrh, pneumonia and pleurisy), of diarrhœal affections, and of the four common epidemic diseases, small pox, measles, scarlatina, and hooping cough. Diagrams 25 and 26 are of the nature of a *summary* of the twelve years, representing the average weather of each week and the average number of cases of sickness received in each week under treatment. They exhibit the average prevalence of sickness at the different seasons of the year (as deduced from the 12 years' observations), and also that of the several common affections particularized. The total number of cases tabulated for the purpose of these diagrams is as follows:—

Of general sickness -	272,469 cases.		
Of respiratory diseases -	47,889 „	= 175·7 per 1,000 of all cases.	
Of diarrhœal affections -	16,456 „	= 60·3 „	„
Of measles - -	5,501 „	= 20·1 „	„
Of hooping cough -	4,580 „	= 16·8 „	„
Of scarlatina - -	3,850 „	= 14·1 „	„
Of small pox - -	1,97 „	= 7·2 „	„

This table indicates *the order of frequency of occurrence* of these diseases in an average town population, during a period sufficiently prolonged to afford time for the occurrence of several epidemics of each, varying in their degree of severity. It is not the same order as comes out when the deaths occurring in the same period are added up. The deaths among all classes of the resident population in the parish of Islington during the same 12 years were as follows:—

		Per 1,000 of all deaths.
Deaths from all causes - - -	40,071.	
„ respiratory diseases -	7,138	= 178·1
„ scarlatina - - -	2,007	= 50·0
„ diarrhœal affections -	1,971	= 49·1
„ hooping cough - -	1,756	= 43·8
„ measles - - -	1,142	= 28·4
„ small pox - - -	475	= 11·8

The comparatively small fatality of small pox and measles, and the comparatively very high fatality of hooping cough, and especially of scarlatina, are obvious on a comparison of these two tables. Unfortunately, too, although these latter diseases do not stand high in the list of epidemic maladies for frequency of occurrence, they not only are of high immediate fatality, but by the damage they effect to the lungs and kidneys respectively, they lay the foundation for chronic affections which go ultimately to swell the catalogue of premature deaths.

General Sickness.

The total number of cases of sickness generally, observed during the 12 years, was 272,469. They were thus distributed:—

In 1857	12,796 cases.	In 1863	26,710 cases.
1858	13,836 „	1864	23,951 „
1859	15,086 „	1865	23,447 „
1860	21,842 „	1866	27,450 „
1861	23,326 „	1867	27,365 „
1862	23,929 „	1868	32,731 „

Diagrams 25, 26, exhibit the line of general sickness as it was, on the whole, distributed through the several periods of the year. The diagrams 1 to 24 exhibit the same line for each year of the twelve. It is to be observed that it forms two waves. Commencing from the 22d week in the year (the 1st week in June), when the general sickness was on the whole at its minimum, the first wave rises rapidly to attain its maximum in the 33d week (the 3d week in August); it then descends still more rapidly than it rose during the next four weeks, terminating in the 37th week (the 2d week in September), but with an amount of sickness considerably greater than that with which it commenced. This wave only occupies 15 weeks out of the 52 for its completion. The remaining 37 weeks are occupied with the second and larger wave, which quickly attains its maximum elevation in the 47th week, and thence declines gradually through the winter, and notably through the spring, until it ends in the minimum of the year again in the 22d week.

There is a fallacy to be taken into account in respect of the sickness recorded in December, especially at its close, and in that of the first week of January, which renders the amount of sickness apparently less than in all probability it actually was. I allude to the social and domestic occupations of the people at this season, culminating in the Christmas week, which very evidently deters them from the seeking of medical advice for lesser ailments, such as would at any other time have sent them to the union surgeons or dispensaries. There is observed thus a gradual diminution in the number of new cases week after week as soon as November has closed. The weekly average of new sickness in the last week of November being 470 cases, it fell week by week as follows:—

48th week	463 cases.
49th „	459 „
50th „	459 „
51st „	387 „
52nd „	321 „
1st week Jan.	426 „

Hence, instead of taking the actual returns of sickness for December s indicating the line of sickness at that period of the year, it would be ore accurate to supplant them by the mean of the sickness of Novem- er and January. Making such a correction we find that, taking the hole sickness of the year as 1,000, the cases are distributed through ie several months as follows:—

January	84·1 cases		
February	82·6 „	Winter quarter	248·5 cases.
March	81·8 „		
April	80·3 „		
May	78·4 „	Spring quarter	237·8 „
June	79·1 „		
July	85·4 „		
August	88·7 „	Summer quarter	257·7 „
September	83·6 „		
October	84·2 „		
November	86·5 „	Autumn quarter	256·0 „
December	85·3 „		
	1,000·0 cases.		1,000·0 cases.

Hence the experience of our 12 years in Islington has been on the hole that, of the several quarters of the year, the summer has been the ost sickly, the autumn rather less so, but nearly equalling it; that ext in order comes the winter quarter, and that the spring quarter has een the least sickly of all.

Of the several months of the year, the order of sickliness has been, ugust the most sickly, then November, July and December, January nd October, September, February, March, April, June, and May, the st being the most healthy month of the year.

Diagram No. 25 shows the relation borne by the line of annual sick- ess to the average meteorological conditions of the several seasons of he year. The minimum of sickness corresponds with a season at which he mean temperature of the air is just 58·7°, with a mean daily range f about 21 degrees, the mean atmospheric humidity being 76 (satura- ion 100), with an average rainfall of 0·82 inches, distributed over etween two and three days in the week. From this point it is observable hat the sickness rises as the warmth of the air rises and the daily range f temperature increases towards the summer months, these conditions eing associated with lessened rainfall and greater dryness of the air. But it is further to be noticed, that the summit of the summer wave of ickness is not attained until some four or five weeks after the maximum emperature of the year has been reached, and until a time when the ummer heat is in course of subsidence, the daily range lessening and he rainfall and atmospheric moisture becoming greater. The end of he summer wave (the minimum of summer sickness) corresponds with time when the mean temperature is the same as at the spring minimum f sickness, viz. 58·7°, the daily range of temperature being about 6 degrees, the atmospheric humidity about 78, with a rainfall of 0·50 inch istributed over between two and three days in the week. Comparing he smaller spring minimum with the greater summer minimum of ickness, we may observe that while the mean temperature is about the ame at the two periods, the former corresponds with a greater daily ange, more rainfall, and rather less atmospheric humidity than the tter. So much for the summer wave.

The greater wave of sickness, which is to occupy the autumn, winter,

and part of the spring, begins to rise as the mean temperature of the year sinks below 58·7°, as the daily range continues to lessen, and as, with these conditions, the atmospheric humidity increases above 78. The maximum sickness is, as has been observed, quickly attained; the summit of the wave corresponds to a temperature of 41·2°, with a daily range of about 11 degrees, and a relative atmospheric humidity of 88. This wave subsides (unlike the summer wave) very gradually indeed; it is not peaked like the summer wave, but has a broad summit, very little subsidence occurring until the seventh week of the winter quarter. Still, during these weeks, from the 47th week of the year onwards, a slight subsidence is observed, corresponding to the slight increase of temperature and the slow reduction in the humidity of the atmosphere which takes place in the last few weeks of December and the beginning of the year. The imperfection of the records of sickness (before alluded to) in the last weeks of December and the first week of January interferes with the determination of the influence of the greatest cold in the first week of the year. However, it is clear that the gradual reduction in the general sickness, and most marked subsidence of the large wave, follow almost immediately upon a rise of the mean temperature above 40°, with diminution of the humidity of the air below 84; and that they continue as the temperature of the year increases, the daily range becomes greater, and the atmospheric humidity less and less.

In looking at the diagrams one is struck forcibly with the facts, 1°, of the excessive sickliness of the year 1863; 2°, of that of the cholera year 1866, from the month of February onwards, not merely of the summer quarter, which would be explicable from the existence of the epidemic; and, 3°, of the continued extraordinary sickliness of the two years succeeding the cholera epidemic, a sickliness not confined to any one quarter, but extending to all the seasons. There is nothing in common in the ordinary meteorological circumstances of these four years to account for these facts. 1863 and 1868 agreed to a certain extent, in having on the whole a high temperature and in being comparatively dry, but 1866 and 1867 were comparatively cool and wet. 1863 was in all respects a remarkable year as regards sickness; for not only was the general sickness high, but it was the year of the grand outburst of small-pox, as well as of a serious epidemic of scarlatina, hooping cough being also unusually prevalent. The year 1866 was notorious not only for the cholera outbreak, but also for a severe epidemic of measles and a renewal of the small-pox epidemic. The year 1867 was remarkable also for the great prevalence of small-pox and scarlatina, and 1868 for scarlatina, measles, and hooping cough. The high sickliness of the year 1863 is in great measure explicable by the wide-spread distress arising out of the cotton famine, and 1867 and 1868 were years of greatly depressed trade, and in addition 1868 was a year in which the price of provisions was exceedingly high.

The order of sickliness of the several quarters and months, as deduced from a general view of my experience of the past 12 years, was not, of course, observed every year. During the 12 years—

Summer stood highest in the order of sickliness 6 times.

„	„	second	„	„	4	„

The most uniformly sickly quarter, then, has been the summer, and the most uniformly healthy quarter has been spring. Autumn would probably come out more uniformly high in sickliness, but for the fallacy introduced by its embracing the month of December.

The meteorological conditions which appear to exercise the most decided influence upon the quantity of general sickness are atmospheric temperature and humidity and rainfall. Table I. is constructed with a view to show what these conditions were in the quarters of greater and less sickliness. I have also introduced columns showing the average cost of provisions in each quarter, and the average amount of pauperism. I have excluded the years 1863, 1867, and 1868, as calculated to disturb the general result. (See Table I., pp. 42, 43.)

From this table it appears, 1st. That the mean temperature of the most sickly quarters, whether winter, spring, summer, or autumn, was on the whole higher than that of the less sickly quarters. This difference is most obvious in the winter quarter, next in the summer quarter, and least in the spring quarter.

2d. That in the winter and spring the mean humidity of the atmosphere was on the whole less in the more sickly quarters than in the less sickly. In the summer and autumn quarters this difference is not remarkable.

3d. That the rainfall (including snow) was greater in the more sickly than in the more healthy winters. In the summers there was scarcely any difference in the mean rainfall of the sickly and more healthy quarters. In the spring and autumn the more healthy quarters were remarkable on the whole for a greater rainfall than the more sickly ones.

4th. That rain fell more frequently in the more sickly winters and summers than in the more healthy ones, but much less frequently in the more sickly than in the more healthy spring quarters.

On the whole it would appear that atmospheric temperature is the most important of the meteorological conditions mentioned, which influence the amount of general sickness. That in the winter a comparatively high temperature with atmospheric dryness, and much and frequent rain or snow, is calculated to render the season unhealthy; and conversely, that cold weather, with a moister atmosphere, and comparatively little rain and snow, is calculated to render the season healthy. That in the spring a moist atmosphere, with frequent and abundant rain, together with comparative lowness of temperature, is calculated to impart a healthy character to the season, while warmer and drier springs are on the whole less healthy. That in the summer season the healthiness or unhealthiness depend almost wholly upon the temperature. Lastly, that the healthiness or unhealthiness of the autumn also depends more upon its temperature than upon any other meteorological condition.

The exceptional year 1863, each quarter of which was unusually sickly, was remarkable for the comparatively high temperature of the winter and autumn quarters, and the atmospheric dryness of the whole year.

In 1867 the sickly winter was cold and comparatively dry, the spring after April had closed warm, the summer not hot until towards its close, and the autumn comparatively cold.

Last year, which was without parallel for sickliness in all the 12, was without parallel also for its uniformly high temperature, little rainfall, and atmospheric dryness. It was only in the latter part of October and in November that the mean temperature fell for any number of consecutive weeks below the average of the season. The average price of wheat was 72*s.* in the winter, 61*s.* in the spring, and 59*s.* in the summer; trade was depressed and pauperism excessive. No wonder, with this accumulation of causes, that the sickness of the year was so great.

The fluctuations of general sickness from week to week are mainly dependent upon the variations of temperature and the occurrence of drought or rainfall. An examination of the diagrams will show that commonly a rise of mean temperature in any week above that of the previous week is associated with an increase of general sickness, while a fall of mean temperature is commonly associated with a reduction in the quantity of general sickness. The greater the extent of these rises and falls the more certain on the whole is the occurrence of the associated normal alteration in amount of sickness. This variation of sickness with fluctuations in temperature is more decided in the colder than in the warmer seasons of the year. It is a subject which I have discussed so fully elsewhere (Med. Chir. Trans., vols. l. and li.), that I need say no more about it here. There are, however, two periods of the year when the rule ceases to apply. One of these is in the spring of the year, when the mean temperature begins permanently to rise above 40°, and the other in the end of the summer, when the temperature usually falls with more or less rapidity below 59°, with considerable increase in the atmospheric humidity. With respect to drought and rainfall, the examination of the diagrams seems to show that, whatever their operation may be on the whole upon the absolute amount of sickness, the first effect of rainfall is to reduce the number of new applicants for relief of sickness, and of absence of rain to increase their number. On analysing tables which I have constructed for the seven years, 1859 to 1865, I find that increase of sickness apparently occurred in 61 per cent. of the weeks in which there happened an entire absence of rainfall: that in weeks in which less than half an inch of rain fell decrease of sickness occurred in only 46 per cent., in weeks in which half an inch and less than one inch fell decrease of sickness happened in 53 per cent., and when more than one inch fell decrease of sickness happened in 61 per cent. The absence of rain and the occurrence of rain both operated more effectually in their several directions when associated with a fall of mean temperature than when associated with a rise.

Diseases of the Organs of Respiration.

Under this term I have grouped together bronchitic and catarrhal affections, asthma, pneumonia, and pleurisy. Not but that the meteorological conditions promotive of these several kinds of attack may be different, but because in the kind of practice from which the data of sickness are taken I find that some of them are not clearly distinguished from others. This is especially the case with the inflammatory diseases of the chest in infants. I exclude phthisis.

The total number of cases of respiratory disease recorded during the

12 years is 47,857. They were distributed among the several years as follows:—

In 1857	2,490	cases, or	19·4	per cent. of all cases.
„ 1858	2,903	„	20·9	„ „
„ 1859	2,520	„	16·7	„ „
„ 1860	4,043	„	18·5	„ „
„ 1861	3,331	„	14·2	„ „
„ 1862	3,999	„	16·7	„ „
„ 1863	4,439	„	16·6	„ „
„ 1864	4,128	„	17·1	„ „
„ 1865	4,088	„	17·4	„ „
„ 1866	4,771	„	17·3	„ „
„ 1867	5,346	„	19·5	„ „
„ 1868	5,799	„	17·7	„ „

As regards the distribution of these diseases on the average throughout the year, it is observable on Diagram 25 that they form one wave, which rises rapidly from the end of the summer during a few weeks, and after attaining its climax subsides through the winter and spring with remarkable deliberation. The following exhibits the distribution of these diseases through the several months and quarters per 100 cases on the average of the 12 years:—

In January	12·8		
„ February	10·9	Winter quarter	34·1 cases.
„ March	10·4		
„ April	8·6		
„ May	6·5	Spring quarter	20·4 „
„ June	5·3		
„ July	4·2		
„ August	4·0	Summer quarter	13·5 „
„ September	5·3		
„ October	8·9		
„ November	12·2	Autumn quarter	32·0 „
„ December	10·9		
	100·0		100·0

It is certain that 10·9 per cent. do not represent the full proportion of December cases, on account of the fallacy previously alluded to. Probably the December cases, if the necessary correction were made, would be equally numerous with the January cases, and thus the autumn would come at least to equal the winter quarter in the prevalence of this class of maladies. It will, therefore, be a fair statement to make that these diseases are at the lowest ebb in the months of July and August; that they begin to prevail in the month of October, and attain their maximum of prevalence in December or January; and then that a gradual, slow, but regular decline takes place through the succeeding months of winter and spring. On the average of the 12 years, the largest number of cases was recorded in the second week of January, and the smallest in the first week in August.

On looking at Diagram 25, it will be observed how very closely the line of general sickness follows that of the respiratory diseases through the year. The correspondence would apparently be almost complete, were it not for the disturbance occasioned by the cropping up of diarrhœal affections in the later spring and in the summer months. It

is this disturbance which evidently occasions the small summer wave in the line of general sickness. The natural inference is, that the quantity of general sickness is chiefly dependent upon the quantity of respiratory disease prevalent at any time, except in the summer season.

I must observe, however, further, that the subsidence of respiratory sickness during the first two or three weeks of December is too great to be attributable to the social cause which lessens the number of new applicants for medical relief during the last weeks of that month, and it is apparently more closely connected with a habitual meteorological condition in these weeks which I shall allude to presently.

Comparing the line of respiratory diseases in Diagram 25 with the meteorological conditions indicated on the table, what strikes us most is the fact that it is almost the precise reverse of the line of mean temperature. It is true that the lines indicate that respiratory diseases are not at their minimum precisely at the time that the highest temperature of the year is attained, nor at their maximum precisely at the time that the lowest temperature is reached; in the former case the minimum is late by about three or four weeks, in the latter the maximum is late by about one week. But this only corresponds with what has been previously remarked about the greater readiness with which these maladies increase among the population than that with which they diminish. Looking for the reason of this general fact, it is difficult to disconnect it with the great difference in the character of the autumn and winter and spring as respects atmospheric humidity, as well as the greater rapidity with which the mean temperature falls from the summer during the autumn than that with which it rises from January to July. The autumn is quite unique in this respect, for not only does the humidity increase most rapidly during September and October, but the humidity of the autumn altogether is very much higher than that of the winter season. Hence it is, probably, that for the same mean temperatures there is in the autumn a larger quantity of respiratory disease than in the winter. Contrast, for instance, the months of November and March. Again, the second week in January was on the whole the most humid week of the whole winter, not the coldest week; and the first week in August was the least humid week of the summer, not the warmest.

I may now refer to the fall in the amount of respiratory diseases, observed in the average of years to occur in the first two or three weeks of December. During the first half or two-thirds of the autumn respiratory diseases were noticed to increase rapidly, and to attain a maximum of prevalence in the last week of November, the 47th week of the year, the mean temperature being 41·2°, and the mean humidity of the air 88. During the next two weeks a mean rise of a degree or a degree and a half of temperature was observed, and although with this the mean humidity was the same or higher, a smaller quantity of respiratory disease occurred on the whole in these weeks.

Table II. shows, for each quarter, the mean meteorological conditions existent in years in which diseases of this class were more or less prevalent. The teaching of the table is not to be mistaken, since it shows for each quarter or season of the year that the occurrence of diseases of this class is promoted by a comparatively low temperature for the season, a comparatively high atmospheric humidity, and much and frequent rain. The only apparent exceptions are, that in the winter quarters the atmospheric humidity was on the whole greater in those years in which respiratory diseases were less prevalent at this season, and that in the autumn there was rather more rain in the years

in which the respiratory diseases prevailed, less than in those in which they were more prevalent. (See Table II., pp. 48, 49.)

Sickness of this kind appears from the diagrams to fluctuate from week to week, increasing in weeks of rise, and decreasing in weeks of fall, of mean temperature. This relation to fluctuations of temperature is very strikingly exemplified in some of the diagrams, and is much more obvious in the colder than in the warmer months. Somewhere about the commencement of the second quarter of the year, when the mean temperature rises permanently above 45°, or thereabouts, this relation ceases for a time to be observable, and rises of mean temperature come to be immediately associated with diminution of respiratory sickness. Also, towards the close of the summer quarter, a similar exceptional occurrence is observed, when the mean temperature falls in the progress of the year below 60°, or thereabouts ; at this time, instead of the falls of temperature being associated with diminution, each weekly reduction of temperature is for a time associated with an increase of respiratory sickness. The exact temperature at which this event is met with varies from year to year ; when the summer has been hot it appears to occur at a higher mean temperature than when the previous summer has been cool. Contrast, for example, the lines of temperature and respiratory sickness towards the end of the summer season in 1868 with those in 1860 or 1862.

Diarrhœal Affections.

The affections thus grouped together are, ordinary diarrhœa, so-called dysentery, and ordinary summer cholera. Of these affections 16,456 cases have been recorded during the 12 years. They were thus distributed :—

In 1857	-	1,375	cases, or	10·7	per cent. of all cases.
„ 1858	-	868	„	6·3	„ „
„ 1859	-	1,322	„	8·7	„ „
„ 1860	-	721	„	3·3	„ „
„ 1861	-	1,395	„	5·9	„ „
„ 1862	-	950	„	3·9	„ „
„ 1863	-	1,340	„	5·0	„ „
„ 1864	-	1,205	„	5·0	„ „
„ 1865	-	1,325	„	5·6	„ „
„ 1866	-	2,586	„	9·4	„ „
„ 1867	-	1,341	„	4·9	„ „
„ 1868	-	2,028	„	6·1	„ „

For the most part then in the years in which respiratory diseases have been proportionally to all sickness less prevalent, diarrhœal affections have been more prevalent. The years 1863, 1866, and 1868 were years in which, however, both respiratory diseases and diarrhœal affections, together with the general sickness, gave high numbers.

The Diagram 25 shows that although diarrhœal affections are met with in practice all the year round, yet the cases only become abundant as the spring draws to a close, during the summer, and the early part of the autumn. Still the following monthly statement of the prevalence of these affections on the mean of 12 years shows that there is a regular wave commencing from the coldest season of the year, rising pretty steadily, but very gradually, to the middle of spring, when the rapidity of increase becomes greater, almost week by week, until the summit of the wave is attained. In like manner these affections diminish rapidly at first, but after about the middle of autumn slowly and steadily to a

minimum of cases. The distribution of 100 cases through the year may be thus represented month by month:—

In January	2·4		
„ February	2·7	Winter quarter	7·9 cases.
„ March	2·8		
„ April	3·0		
„ May	3·8	Spring quarter	14·3 „
„ June	7·5		
„ July	21·1		
„ August	27·5	Summer quarter	63·4 „
„ September	14·8		
„ October	7·5		
„ November	4·1	Autumn quarter	14·4 „
„ December	2·8		
	100·0		100·0

The spring and autumn then stand on about the same level as to the prevalence of diarrhœal affections, the winter quarter presenting only about half as many cases as either of them. The smallest number of cases was met with on the whole in the first week of the year, and, on the average of the 12 years, the coldest week of all the year. With almost complete regularity the cases increased in number week by week, until from a weekly average of 6·6 cases a weekly average of 91·8 cases was reached in the 30th week of the year, the last week in July. And then, following the line of average diarrhœa, a lessening in the number of cases occurred during two weeks, after which, in the 33rd week, the third week in August, a further rise took place, and the maximum of the year was attained. The regular diminution of diarrhœa succeeded. Now this order of occurrences gives to the summit of the average diarrhœal wave in Diagram 25 a remarkable shape, resembling the vertical section of the crater of a volcano, of which one margin is higher than the opposite. It is a fair representation of an occurrence which the annual diagrams show to have been very common in the course of summer diarrhœa, for the diarrhœal wave-line of most years exhibits more or less of this peculiar form of summit. The number of weeks intervening between the two elevated points is not always the same, nor is the relative height of these points always the same; but there is nearly always some indication more or less marked of a maximum, or apparent maximum, being attained, then of a lessening of diarrhœa, and then of a second real or apparent maximum of cases. It is well seen in the diagrams for 1857, 1858, 1861, 1863, 1864, 1865, and 1867.

I must here draw attention to the regularity with which the line of general sickness follows that of diarrhœa in the 25th diagram, from the 24th to the 37th week.

The line of diarrhœa, however, does not exactly follow that of mean temperature. The lowest part of the line indeed corresponds with the lowest weekly temperature of the year, and it rises as the mean temperature on the whole rises, and as the atmospheric humidity on the whole lessens, but very slowly and gradually. Nothing like an abrupt rise happens until the line of mean temperature marks an elevation of atmospheric warmth to 60° and upwards, in the 25th week. In like manner, during the decline of diarrhœa, the weekly diminution of this kind of sickness ceases to be rapid and becomes smaller, and the diminution more gradual in the 38th week, on the falling of the mean temperature

materially below 60°. In the interval between these periods the rise on the one side and the fall on the other is observed to be considerable week by week. And now I must direct attention to what I may term the two apexes of the cone formed by the diarrhœal line, or to what may be termed the two maximums of diarrhœa. It is to be observed that the first does not correspond with the week of highest mean temperature of the year, but points to a period two weeks later. Following now the line of mean temperature, it appears that on the whole (although it remains high) some reduction occurs in the temperature of the three or four weeks succeeding that of highest temperature, and that then a second rise to a less extent takes place prior to the final fall of the mean temperature of the year to 60° and under. This fact offers some explanation of the peculiar shape of the top of the diarrhœal wave, the second apex corresponding with the week following that of the second rise of temperature. The lesson these facts seem to teach us is this, that a high temperature does not produce diarrhœa by an immediate action upon the system, but by some more gradual process, one probably not confined to the people under its influence, but extended to their surroundings also—the soil, the water, and perhaps also the food. The diagrams for individual years may be appealed to to illustrate the same truths as the diagrammatic summary teaches. It is to be further observed that the top of the diarrhœal wave corresponds also pretty nearly with the period of greatest atmospheric dryness, although not with that of least average summer rainfall.

Table III. exhibits the relation between diarrhœa and the more important meteorological conditions present in seasons of greater or less prevalence of this class of affections. I omit the year 1866 as altogether exceptional—I shall refer to it again—and shall confine myself to the period from June to October, as embracing that which is alone important for our purpose. (See Table III., pp. 52, 53.)

The severity with which the diarrhœal season sets in in the month of June depends clearly upon the heat and dryness of the atmosphere; similar conditions governing also the prevalence of diarrhœal affections throughout the summer quarter. It is remarkable that as diarrhœa approaches the period of its quiescence in October, the months in which it prevailed most were those in which this season of the year was most strongly characterized on the whole by atmospheric humidity and rainfall.

The hot and dry year 1868 illustrates well the meteorological conditions favourable to the prevalence of diarrhœa. Cases of diarrhœa were unusually numerous from the very beginning of the spring quarter, and in the course of the summer it attained a degree of prevalence (1,309 cases) only comparable with that of the summers of 1857 and 1859, and approaching nearest of all to that of the cholera season of 1866.

The exceptional cholera year 1866 deserves particular notice, chiefly because the summer diarrhœa, the recorded cases of which amounted in the three months July, August, and September to 1,879, did not correspond to the meteorological conditions existent during its prevalence. Neither did the summit of the diarrhœal wave, as will be seen on looking at Diagram 19, correspond with that of the wave of epidemic cholera as it presented itself in this district. The mean temperature of the 13 weeks of summer was positively low, viz., 58·7°; that of the four weeks of July being 61·5°, of the four weeks of August 58·9°, and of the five weeks of September 56·9°. The humidity of the atmosphere also was great for the season, and the rainfall considerable. It was therefore impossible to fail in recognizing in this season the operation of a cause other than the ordinary meteorological causes of summer diarrhœa,

Mean -	75	51·5	85	1·39	11

producing the enormous amount of diarrhœa observed ;—for the case recorded upon the books, numerous as they were, did not represen anything like all that were admitted under treatment. A considerati of the temperature of the season week by week will put this in a sti clearer light. In the fourth week of June the mean temperature wa 58·1°, and in the fifth week it suddenly rose to 66·3° ; in the wee following it fell 10 degrees, to rise in the second week of July 12 degree to 68·2°, the highest weekly mean of the year. For four or five week after this it progressively fell to 58·0°. The month of June was no remarkable for diarrhœa, and gave no promise, had not cholera bee anticipated, of a heavy diarrhœal epidemic. In the fifth week of Jun only 28 cases were recorded ; in the first week of July there were 5 cases, and they increased week by week thus, 43, 99, 115, 165, 272, 31 the last number being attained in the third week of August, that is, fiv weeks after the maximum temperature of the year had been reache the steady increase of cases having gone on concurrently with a stead decline of mean temperature below 60°. Our maximum of weekl cases of diarrhœa was attained on the second week after the most fat week of cholera in London, which was also the week on which th largest number of cases of the disease was observed in Islingto Diarrhœa then increased as cholera declined.

Measles.

The number of cases of measles recorded during the 12 years w 5,501. It is thus made up :—

In 1857	- -	221 cases,	or 17·2	per 1,000	of all cases.
„ 1858	- -	416 „	30·0	„	„
„ 1859	- -	328 „	21·7	„	„
„ 1860	- -	531 „	24·3	„	„
„ 1861	- -	280 „	12·0	„	„
„ 1862	- -	653 „	27·2	„	„
„ 1863	- -	322 „	12·0	„	„
„ 1864	- -	713 „	29·7	„	„
„ 1865	- -	200 „	8·5	„	„
„ 1866	- -	813 „	29·6	„	„
„ 1867	- -	328 „	11·9	„	„
„ 1868	- -	696 „	21·2	„	„

What strikes a person first in looking at this list is, that, in the limit district to which these figures relate, measles was epidemic regula every second year, the only exception being that 1859 did not exhibit t full subsidence of the disease which this observation would have led o to anticipate. I do not gather from the death register that the years greater prevalence of measles here were years of greater prevale throughout the kingdom. It would seem as if an epidemic of meas so far exhausted the susceptibility of the population here that it did recover itself for two years. There was nothing very decidedly common in the meteorological conditions either of the epidemic ye or of the years of less prevalence of the disease. Contrast for exam the cold wet year 1860 and the excessively hot and dry year 1868. would be interesting to know whether in other limited communiti similar observation has been made. It is remarkable also that the p centage of all cases of sickness was nearly the same number in four of the six epidemic years, viz., 1858, 1862, 1864, and 1866. All can be said is that on the whole, putting out 1868, the years of gre prevalence of measles were rather cooler years than those of prevalence.

Diagram 26 exhibits the line of measles in accordance with our 12 years' experience of its distribution through the several seasons of the year. It forms two waves in the year, the one culminating in the latter part of spring, the other at the end of autumn. Of these the earlier is the more considerable wave. Assuming the yearly occurrence of 100 cases, the normal distribution of measles may be represented as follows:—

In January	7·1		
„ February	6·0	Winter quarter	19·3 cases.
„ March	6·2		
„ April	6·5		
„ May	11·3	Spring quarter	30·4 „
„ June	12·6		
„ July	10·4		
„ August	7·5	Summer quarter	25·8 „
„ September	7·9		
„ October	6·8		
„ November	8·3	Autumn quarter	24·5 „
„ December	9·4		
	100·0		100·0 „

The smallest number of cases occurred in the month of February, the largest number in June. The spring wave of the epidemic rises with some suddenness in May, but subsides more gradually to October. Altogether the spring quarter was that in which measles prevailed most; it was less prevalent in summer and autumn, and least so in the winter quarter.

Referring to the diagrams, we find that out of the six epidemic years, 1858, 1860, 1862, 1864, 1866, and 1868, there were four in which the largest number of cases occurred in the spring quarter, and only two, 1862 and 1868, in which the largest number occurred in the autumn quarter; still in 1862 the largest monthly number of cases occurred in May and June, and the next largest number in December. In 1868 the largest number of cases occurred in December.

In the non-epidemic years, 1857, 1859, 1861, 1863, 1865, 1867, spring was not so specially favoured. In two of these years, 1859 and 1865, the largest number of cases occurred in the winter quarter. In 1859 spring and summer were little less troubled with measles, the largest monthly number of cases occurring in May and September. In 1865 the winter measles was a mere prolongation of the autumnal epidemic of 1864 into January and February. The epidemic of 1866 began in December of 1865, the disease having been in abeyance from March to that month. In two of these years, 1857 and 1867, the greatest number of cases of measles occurred in the autumn. When this happened the disease abated in the succeeding winter. In only one of these years, 1863, did the largest number of cases occur in the spring, and in only one, 1861, did the largest number occur in the summer season.

In five out of the six epidemic years, not only was there a large number of cases forming a wave of measles culminating in the spring and early part of summer, but there was a considerable autumnal wave also. The exceptional year was the cold wet year 1860, when the autumnal wave did not occur at all. Only in two out of these five years was the autumnal wave greater than the spring wave, namely in 1862 and 1868. In 1862 it was very slightly greater, the greatest monthly number of cases occurring in June and July. In 1868 the disease steadily in-

creased quarter by quarter as the year progressed, the summer cases exceeding the spring slightly, and the winter greatly exceeding either. The largest number of cases happened in November and December.

In four out of six of the non-epidemic years there was an autumnal wave greater than the spring wave, viz., in 1857, 1861 (slightly), 1865, and 1867 (considerably).

Although it must be concluded that on the whole measles is more abundant in the spring quarter, yet the occurrence of an autumnal wave must be regarded as a more constant event.

There were four years out of the 12, viz., 1861, 1866, 1867, and 1868, in which measles was more abundant in the summer than in the spring quarter. In 1861 the largest number of cases occurred in August; in 1866 about an equal proportion of cases happened in June, July, August, and September; in 1867 there were more cases in July and August than in June; and in 1868 the disease, which prevailed considerably in May, declined during June, July, and August, to increase in September up to the end of the year.

In searching for the meteorological conditions which occasion the waves of measles, which promote its increase or its decline, we may first of all consider the habitual meteorological conditions of those seasons which our 12 years' experience teach us are favourable to the spread of the disease, or the reverse.

And here we must recollect that the law by which contagious diseases spread in a population is, that when once started under favourable conditions of weather and season, another element of rapid extension comes into play, namely, the growing increase in the number of foci of contagion; so that so long as the conditions of weather and season are not absolutely unfavourable to the life and development of the morbific germs, the disease increases in extent, and does not lessen until either the susceptibility of the population is exhausted, or conditions of season come about absolutely unfavourable to the spread of the malady. Moreover in estimating the conditions of weather favourable to measles, or the reverse, we must bear in mind that this disease has an incubation of about 14 days, and make an allowance accordingly. I must give this as an instruction in the reading of the diagrams so far as measles is concerned. In the decline of an epidemic we must similarly bear in mind the progressive diminution of the foci of contagion. Now referring to my records of the 12 years, I find that on the average measles began to assume its epidemic character in the 18th week of the year, that is, in the first week of May. The average weekly meteorological conditions and average weekly number of cases of measles for each week about this time were as follows:—

—	Average of new Cases Two Weeks later.	Mean Temperature.	Mean daily Range of Temperature.	Mean Humidity.	Mean Rainfall.	Rainy Days in 12 Years.
		°	°		Inches.	
12th week	5·2	40·9	15·0	81	0·41	33
13th „	7·2	45·4	15·8	81	0·38	45
14th „	6·0	46·6	17·4	82	0·38	34
15th „	8·8	46·6	17·4	81	0·44	40
16th „	11·0	48·2	20·3	75	0·14	19
17th „	11·5	49·1	18·9	79	0·50	32
18th „	14·1	49·2	19·2	74	0·22	23

From which we may gather that the conditions most favourable to the outbreak of the spring epidemic of measles are, the rise of the mean tem-

rature to 48° or upwards, with an increase of daily range to 20° and wards, combined with a lowering of the atmospheric humidity to 75° nd under, the rainfall and the number of wet days being at the same me much below the average of the whole season. It is worthy of otice that the meteorological averages of the 17th week exhibited a turn towards those of the 15th, and that with this the average of cases measles was nearly stationary. Again, that on the average tempe- ature rising in the 18th week above that of the 16th, with a reduction the humidity and rain, measles rose again above the average of the 6th week.

Again, the average number of cases of measles began to fall perma- ently in the 28th week, that is, in the second week of July. The average f cases and meteorological conditions about this time were as follows :—

—	Average of new Cases Two Weeks later.	Mean Tempera- ture.	Mean daily Range of Temperature.	Mean Humidity.	Mean Rainfall.	Rainy Days in 12 Years.
		°	°		Inches.	
22d week	14·8	57·8	21·1	76	0·82	33
23d „	13·3	58·5	20·5	78	0·63	32
24th „	12·3	58·8	21·8	74	0·35	26
25th „	13·2	60·2	22·0	75	0·47	32
26th „	12·1	60·4	20·7	74	0·48	32
27th „	10·1	59·9	21·5	74	0·40	29
28th „	8·0	63·6	23·7	73	0·23	17
29th „	9·0	63·5	20·2	73	0·59	30

From which it appears that the condition and the only condition which his table indicates, as concerned in the arrest of the spread of measles, s the rise of the temperature of the atmosphere above a mean of 60°.

And now for the autumnal epidemic. The first outbreak of this took place on the average of the 12 years in the 47th week of the year, that s, in the last week of November. The averages about this time are as follows :—

—	Average of new Cases Two Weeks later.	Mean Tempera- ture.	Mean Daily Range.	Mean Humidity.	Mean Rainfall.	Rainy Days in 12 Years.
		°	°		Inches.	
42nd week	7·2	51·2	14·3	88	0·87	46
43rd „	8·6	48·8	14·1	89	0·54	35
44th „	8·2	46·7	14·8	88	0·47	41
45th „	11·0	43·0	13·1	87	0·30	24
46th „	10·7	41·6	12·7	88	0·49	30
47th „	12·3	41·2	12·4	88	0·44	34
48th „	8·6	42·2	10·3	88	0·44	40
49th „	10·1	42·9	10·9	90	0·46	42
50th „	7·4	41·5	9·2	88	0·35	36
51st „	9·0	40·8	10·4	86	0·28	29
52nd „	7·0	39·6	9·7	87	0·31	31
1st „	8·1	35·2	9·9	85	0·39	40
2nd „	5·5	37·4	10·3	87	0·63	41

This seems to show that the arrival of the temperature below 49° and especially to about 43°, with a diminution of range to about 13 degrees, and again (as in the spring) a small rainfall for the season, are the conditions which favour the outbreak of the autumnal epidemic.

The circumstances promotive of the decline of the autumnal epidemic are less obvious; all that appears clearly is, that it shows a manifest disposition to decline on the fall of the mean temperature below 42°.

Putting the characters of the two epidemic seasons together, I think we may conclude that—1. The conditions promotive of an outbreak of measles in any year are a temperature between 43° and 48°.—2. That a low atmospheric humidity and small rainfall assist materially in promoting an outbreak. Probably the higher humidity of the autumn than of the spring is one reason why ordinarily the autumnal epidemic is less extensive than the spring epidemic.—3. That a rise of mean temperature above 60° and a fall below 42° tend distinctly to arrest an epidemic.

Table IV. (pp. 59, 60) exhibits the leading meteorological condition of each quarter of the several years, dividing the quarters into those in which measles prevailed more or less. It seems to show—

1. That in the *winter* season a comparatively warm and dry atmosphere with excess of rainfall are conditions which favour the extension of measles among a population more than the opposite conditions.

2. That in the *spring* a comparatively cool season with atmospheric dryness and excess of rainfall promote the spread of the disease.

3. That in the *summer* measles spreads more when the atmosphere is comparatively cool and moist, with excessive and frequent rains.

4. That in the *autumn* a comparatively warm dry atmosphere with small rainfall is most favourable to the operation of the morbific cause.

These inferences, although at the first blush contradictory to those just enunciated, need not be regarded as actually so. The former may relate to the conditions favourable to the life and development of the germs, the latter to those which predispose a population, just as bad hygienic conditions generally would do, to suffer from the malady.

There is only one other point I need draw attention to in relation to the line of measles in the diagrams, and this is, that making the necessary fortnight's allowance (or thereabouts) for incubation, measles appears to have increased commonly after any great alteration of mean temperature, whether by way of increase or diminution. That is to say, one is led to expect from the experience of the 12 years, especially when an epidemic is due, that it will break out about a fortnight after the occurrence of a serious rise in the mean temperature of the year, and that in its progress an increase of cases may be anticipated in the second week following any considerable rise or fall of temperature. In the autumn, as the temperature of 48° is approached, the outbreak of the epidemic may be anticipated when a serious fall of mean temperature occurs.

There was among the 12 years one only in which measles pretty steadily increased quarter by quarter through the year, the autumnal epidemic being more serious than the spring epidemic. This was the year 1868; hence it is instructive. The spring epidemic broke out very suddenly in the 17th week of the year, that is, in the last week of April. There was some abatement in the month of August, but it burst out afresh and with severity in the middle of September, and was very severe as the year closed. Hence it will be desirable to exhibit in a table the corresponding meteorological conditions.

TABLE IV.

Winter Quarters.

Of greater Prevalence of Measles.						Of less Prevalence of Measles.

In studying this table it must be kept in mind that 1868 was a year in which an epidemic of measles was due, and had it not been for the remarkable temperature and drought of the spring and early summer, the epidemic would have prevailed, in all probability, chiefly in this season. As it was, these conditions seem to have checked its progress, and deferred the severity of the outbreak until the temperature fell to a point at which the morbific germs could be in circumstances to operate effectually upon the population whose susceptibility had not yet been exhausted. The outbreak commenced about a fortnight or three weeks after a period of remarkable absence of rain, the temperature having arrived midway between 43° and 48°, the range being about 20 degrees, and the humidity of the atmosphere for a short time having fallen to about 77. I have emphasized in the table some of the occurrences in certain weeks. In the 22nd week, after long drought, a heavy rainfall (comparatively) occurred, and measles rose a fortnight after from eight cases to 22 in the week. It subsided remarkably after the 24th week, in association with a remarkable rise of temperature with very unusual dryness of the atmosphere and lack of rain, and another decided subsidence took place

in the 30th week; a fortnight after the mean temperature had attaine the excessive height of 70·7° with a mean daily range of 27·8 and a humidity of only 64, and this notwithstanding comparativel much rainfall in that week. Measles again underwent a remarkab fall in the 36th week from 17 cases to 5, the 34th week being distinguishe from those before and succeeding it by a very high atmospheric humidit and an unusually small mean daily range for the season, and this agai notwithstanding the heavy and continued rainfall. In the next wee measles increased again on the reduction of the mean temperature belo 60°, with greater range and a humidity of 71. In the 42nd wee another remarkable reduction of measles occurred, following a curiou and sudden reduction of range and increase of humidity, and agai uninfluenced by the heavy and continued rainfall. The latter seems onl to have operated in promoting the spread of measles in this yea when not associated with a high atmospheric humidity. Measles agai underwent a great increase, the commencement of the autumnal epidem in the 45th week. In the 42nd the mean temperature first fell co siderably below 50°. A temperature about or below 40° in the 46 or 47th weeks evidently checked its progress, but it recovered itse when in the 48th week the mean temperature again rose to above 42·5°.

Scarlatina.

The number of cases of scarlatina recorded during the 12 years w 3,850. It is thus made up :—

In 1857 -	- 75	cases, or	5·8	per 1,000	of all cases.
„ 1858 -	- 162	„	11·7	„	„
„ 1859 -	- 426	„	24·9	„	„
„ 1860 -	- 232	„	10·6	„	„

„ 1864 -	- 269	„	11·2	„	„
„ 1865 -	- 292	„	12·4	„	„
„ 1866 -	- 255	„	9·2	„	„
„ 1867 -	- 524	„	19·1	„	„
„ 1868 -	- 439	„	13·4	„	„

It is observable that three non-epidemic years intervened between t epidemic years 1859 and 1863, and three again between the epidem years 1863 and 1867. Last year, in all respects exceptional, was al marked by an epidemic of scarlatina, but of less extent than that 1867. On the whole these epidemic years were years of comparative high mean temperature and atmospheric dryness. Putting aside t epidemic years, the prevalence of scarlatina in the non-epidemic ye did not differ very materially. The proportion of scarlatina to all ca of sickness differed very little in 1859 and 1863. In 1867, the fou year from the last epidemic, the outbreak of scarlatina was on the wh less severe, perhaps in association with the comparatively low me temperature of the year. 1868 should, in accordance with previ experience, have been a non-epidemic year; and in point of f although the cases were very numerous absolutely, the proportion bo to all cases of sickness was not much higher than that in 1862 and 18 Probably the comparatively high absolute number was due to sim causes which occasioned the great general sickness among the poor year, combined with the excessive heat and dryness of the first th quarters.

Diagram 26 exhibits the line of distribution of scarlatina through

veral seasons of the year, in accordance with our 12 years' experience. carlatina forms but one grand wave in the year.

Assuming the yearly occurrence of 100 cases, the following indicates e proportion of cases which occurred in the several seasons of the ar :—

In January	6·5	
„ February	6·8	Winter quarter, 17·7 cases.
„ March	4·4	
„ April	5·7	
„ May	5·6	Spring quarter, 17·3 „
„ June	6·0	
„ July	9·1	
„ August	8·6	Summer quarter, 29·9 „
„ September	12·2	
„ October	14·5	
„ November	11·4	Autumn quarter, 35·1 „
„ December	9·2	
	100·0	100·0

The smallest number of cases occurred in the month of March, and he prevalence of the disease has been in our experience greater as the pring and summer advanced, until the month of October, in which the lisease has been observed to be more prevalent than in any other. From October it has been observed to become less prevalent, through November, December, January, and February to March. Scarlatina, hen, is a disease which attaches itself with very marked preference to he latter half of the year. It is curious that it should be about equally prevalent on the whole in months of such opposite characters as July nd December.

Of the four epidemic years, 1859, 1863, 1867, and 1868, there were two, 1859 and 1867, in which the largest number of cases occurred in the autumn quarter ; in the other two years, 1863 and 1868, the largest number occurred in the summer quarter.

Of the eight non-epidemic years there were four, 1857, 1858, 1864, and 1865, in which the summer quarter exhibited the largest quantity of scarlatina ; three, 1861, 1862, and 1866, in which the greatest number of cases occurred in the autumn.

It would appear as if some preparation were made, or warning given, the year previous to an epidemic of scarlatina. Thus in 1858 scarlatina suddenly burst out in the month of September, with 51 cases in five weeks (14 having been recorded in August). It then subsided as the autumn proceeded, but still there was a considerable number of cases. It fell almost into abeyance in February and March of 1859, after which it increased quarter by quarter to the end of the year. The great outburst began in September. The last week of this month, with the whole of October and November, up to the last week of that month, embraced the worst period of the most extensive epidemic of the whole 12 years. It did not completely come to an end until the end of March 1860.

Again, the grand epidemic year 1863 was preceded by a sharp autumnal outbreak in 1862. Indeed, one may go so far as to regard this epidemic as extending without break from September 1862 to the end of 1863. The 1859 epidemic came to an end in April 1860 ; and with the exception of the ordinary increase of the disease which may be expected every summer and autumn, nothing remarkable was observed until the end of the summer of 1861. In September, October, and

November a slight epidemic wave occurred, which extended, subsiding, however, through the winter of 1862. The disease almost died out in June, but gradually increased afterwards; and in September began the heavy epidemic which only terminated with the end of the next year, 1863. There was merely some little abatement of the epidemic violence at times during the winter and spring of 1863, but from July to October it exhibited its chief activity.

The epidemic which we have last experienced commenced with an outburst of the disease in the autumn of 1866. It subsided a little during the winter quarter of 1867, but then increased from April, month after month, until October, upon which month the chief violence of the epidemic was expended. A partial subsidence of the disease then commenced, continuing through January, February, and March 1868. The spring months of this year, however, saw the epidemic reviving; and it was as severe, to say the least, in the spring and summer of 1868 as in those of 1867. After September the epidemic declined, and only 99 cases were recorded in the autumn quarter of 1868, against 222 in the corresponding period of the previous year.

Unlike measles, scarlatina has so brief an incubation that it may be disregarded practically in any consideration of its meteorological associations. Following the same method of inquiry that we pursued with measles, we may study, on the following table, first of all, the conditions which, on the average of years, seem to promote the outbreak of the disease or favour its decline. We may consider the disease as usually pretty much in abeyance until about the 27th week of the year, that is, the first week in July.

50th „ -	6·5	41·5	9·2	88	0·35	
51st „ -	5·9	40·8	10·4	86	0·28	
52nd „ -	4·4	39·6	9·7	87	0·31	

There were two periods then at which an increase of scarlatina took ace. The first, a moderate increase in the first week of the summer uarter on the arrival of the yearly rise of mean temperature to or bout 60°. The other, as the summer was closing, when the mean mperature had recently arrived again at about 60° and had begun to fall low it. In the instance of the first increase it is observable that some rce was evidently operating antagonistic to the active propagation of e disease, in the latter increase some condition was operating favour-ble to its propagation. The rainfall was not very different in the two stances, but there was a decided difference in the range of tempera-re on and after the 27th week of the year and that on and after the 8th week. On and after the 27th week the mean daily range was l degrees and upwards, and the humidity was low, from 73 to 76. On nd after the 38th week the mean daily range was below 16 degrees, nd the humidity 79 and upwards to 83. It is observable that the ecline of the disease in the mean of years began to take place as the ean temperature and range fell below 53° and 16°, and the humidity se to 87 and upwards.

The inferences apparently deducible are, that—

1. A mean atmospheric temperature of about 60° or between 56° and 0°, is that most favourable to the outbreak of scarlatina. 2. That for ts free development it is necessary that the humidity of the atmosphere hall not much exceed 86, or be much less than 74. 3. That a higher emperature than 60° does not appear to be in itself unfavourable to the pread of scarlatina. 4. That a fall of mean temperature below 53° ends to arrest an epidemic of this disease.

Table 5 exhibits for each quarter the most important meteorological conditions of the seasons in which scarlatina was more or less prevalent. (See Table V., pp. 66, 67.) From this it appears :—

1. That at *all seasons* of the year, but more decidedly in the winter and spring—seasons in which scarlatina is not commonly epidemic—its extension is favoured by a temperature above the average of the season.

2. That at all seasons *except the autumn*, a dry as well as a warm atmosphere is calculated to promote its epidemic prevalence.

3. That in the *winter*, *spring*, and *summer* the disease is less disposed to spread when a good deal of rain is associated with the comparatively low temperature and high atmospheric humidity, but in the *autumn* the table indicates that the warmer and wetter seasons were those which proved most favourable to the extension of the epidemic.

One word about the epidemic prevalence of scarlatina last year. In accordance with the experience of former epidemics, the epidemic of 1867 might have been expected to terminate in the winter of 1868 That it did not, but that it extended through the year, was probably due to two causes—the high temperature and atmospheric dryness of the winter, spring, and summer, and the operation of those general causes of sickliness among the poor which have already been referred to.

Hooping Cough.

The 4,580 cases of hooping cough recorded during the 12 years were distributed among them thus :—

In 1857	-	218 cases,	or 17·0	per 1,000	of all cases.
„ 1858	-	372 „	26·8	„	„
„ 1859	-	259 „	17·1	„	„
„ 1860	-	264 „	12·0	„	„

There is no indication here of a cyclical recurrence of the disease such as was noted in respect of measles and scarlatina.

Diagram 26 shows the line of the distribution of hooping cough on the whole through the several seasons of the year. It resembles the line of measles in presenting two waves—a larger one culminating in the month of June, and a smaller one in the month of December. There are, however, between the two waves these differences, viz., 1st, that although they correspond in this respect, the waves of hooping cough seem to anticipate a little those of measles; and 2nd, that the waves are less pronounced, this being due to a more uniform distribution of the disease than is observed with measles.

The following represents the mean distribution of hooping cough through the several seasons of the year, as per 100 cases:—

In January	-	-	8·4
„ February	-	-	8·9 } Winter quarter, 25·6 cases.
„ March	-	-	8·3
„ April	-	-	9·2
„ May	-	-	9·3 } Spring quarter, 28·7 „
„ June	-	-	10·2
„ July	-	-	7·6
„ August	-	-	6·1 } Summer quarter, 20·0 „
„ September	-	-	6·3
„ October	-	-	7·6
„ November	-	-	8·8 } Autumn quarter, 25·7 „
„ December	-	-	9·3
			100·0 1·00

The autumn and winter quarters appear to be alike in respect of the prevalence of hooping cough. The spring quarter is that in which I have observed that the disease prevails most, and the summer that in which it prevails least. The largest proportion of cases was observed to occur in the whole in the month of June, and the smallest in the months of August and September. The short period of time which elapses between the period of greatest and least prevalence is remarkable, the decline of the disease as summer comes on being very sudden.

The following represents the average meteorological conditions of the weeks about the period of the spring rise and subsequent sudden fall, and of the autumnal rise. I assume about a week as the period of incubation; probably it is something less than this, but it is not likely that medical aid would be sought until the disease was tolerably pronounced. I allow a week, then, in the table as a fair correction. I begin from the twelfth week of the year, thus to correspond with the last week of the winter quarter.

om which it appears that, 1st. The spread of hooping cough is pro-d by a mean temperature above 46°, and especially by a temperature een 57° and 60°. 2d. That a mean temperature above 60° is very vourable to the disease, and distinctly promotive of its decline when emic. 3d. That a mean temperature below 40° is also less favour- than one between 40° and 46°, but more favourable than a mean erature above 60°. I have had some reason to suspect that a high metric pressure is favourable to the occurrence of the convulsive tions of children, but there is no connexion traceable between this the extension of hooping cough.

able VI. shows for each quarter the more important meteorological litions of the seasons in which hooping cough was more or less alent. From this it appears, 1. That in all seasons of the year, the exception of autumn, the extension of hooping cough is pro-d by a comparatively warm and dry atmosphere; in the autumn a n and moist season appears to be most favourable to it. 2. In spring and summer the unfavourable influence of atmospheric ture and much rain is especially obvious. Great atmospheric dry- and little rainfall appear capable of counteracting to some extent operation of a temperature above 60°, as in the summer of 1868. Table VI., pp. 70, 71.)

Small Pox.

The 1,977 cases of small pox were distributed through the 12 y thus :—

In 1857	- 28	or	2·1	per 1,000	of all cases.
„ 1858	- 42	„	3·0	„	„
„ 1859	- 65	„	4·3	„	„
„ 1860	- 138	„	6·3	„	„
„ 1861	- 27	„	1·1	„	„
„ 1862	- 76	„	3·1	„	„
„ 1863	- 488	„	18·2	„	„
„ 1864	- 89	„	3·7	„	„
„ 1865	- 209	„	8·9	„	„
„ 1866	- 318	„	11·5	„	„
„ 1867	- 329	„	12·0	„	„
„ 1868	- 168	„	5·1	„	„

We have to note here a gradual increase of small pox year by y from 1857 to 1860, when it exhibited an approach to epid prevalence ; then a sudden reduction in the next year, 1861, increase in 1862, and the grand epidemic outburst of 1863. Agai the year after the epidemic, in 1864, a diminution of small pox al proportional to what took place after 1860. Since 1864 small p has been increasing in prevalence year by year until 1868, when in middle of August it almost abruptly died away from among our popul tion. From the second week in August until the second week November only three cases, at long intervals, were recorded in t books to which I had access. A prolonged freedom from small pox su as this had not occurred in Islington since the middle of 1862. I ma say here, by way of anticipation, that in no week of all the 11 yea prior to 1868 did the mean temperature of any week exceed 71°, an that temperature only was attained in the 28th week of 1859 ; nor i any week prior to 1868 did the mean of the highest day temperatu reach above 86°, and that was in the same week. In the four weeks July 1859 the means of the maximum temperatures were 81·4 86·5°, 82·6°, and 79·0°. Nothing approaching so prolonged a hig temperature in the daytime occurred again until last year. In the secon week of July 1868, the mean of the maximum temperatures of the wee was 79·8 ; in the third, 86·0° ; in the fourth, 84·4° ; in the first wee of August, 81·7° ; and in the second, 83·6°. The mean temperature the third week of July was 70·7° ; of the fourth, 69·2 ; of the first wee of August, 67·6° ; and of the second, 69·8°.

Whatever, then, the causes may have been which for so many year past have fostered small pox, the cause of the disappearance of th disease in August last is scarcely possible to be overlooked. The effor made since 1863 to render the vaccination of our population more com plete and perfect have probably saved us, during 1866 and 1867, fro an epidemic more serious even than that of 1863, which itself was thre times more serious than that of 1860 ; but it is clear that the cessatio of the plague has been the result of climatic conditions.

Diagram 26 shows the seasonal line of small pox as it has pursue its course on the average of the 12 years. Small pox, like scarlatin forms but one wave in the course of the year. Its prevalence in th several months and quarters may be represented thus per 100 cases :—

January	8·7		
February	8·0	Winter quarter,	27·1 cases.
March	10·4		
April	11·8		
May	14·3	Spring quarter,	35·8 „
June	9·7		
July	7·2		
August	6·1	Summer quarter,	17·9 „
September	4·6		
October	4·6		
November	6·7	Autumn quarter,	19·2 „
December	7·9		
	100·0		1·00

ule has been for small pox to prevail least in the summer, to through the autumn and winter, and to prevail most in the f the year. The smallest number of cases on the whole was l in the months of September and October; the wave rose y through the succeeding months (with a slight check in y), to attain its highest point in the month of May. From this sank rapidly through July and August, to attain its lowest gain in September. Small pox is therefore clearly a disease the on of which is promoted by cold weather and checked by hot .

y consideration of its association with conditions of weather an ce of about a fortnight must be made for the incubation of the

he average of the 12 years we may regard the disease at its oint in the month of October, and the commencing increase to ken place about the first week in November. The meteoro- conditions on the mean of the 12 years about this time were as :—

	Average of new Cases Two Weeks later.	Mean Tempera-ture.	Mean daily Range of Tempera-ture.	Mean Humidity.	Mean Rainfall.	Rainy Days, 12 Years.
		°	°		Inches.	
k	1·2	55·5	17·1	84	0·55	37
-	1·9	54·5	16·2	83	0·37	27
-	1·2	52·5	15·1	87	0·50	37
-	1·8	51·2	14·3	88	*0·87*	46
-	2·0	48·8	14·1	89	0·54	35
-	3·1	46·7	14·8	88	0·47	41
-	3·1	43·0	13·1	87	0·30	24
-	3·9	41·6	12·7	88	0·49	30

l pox, then, may be considered as beginning to extend when the ature at the commencement of the autumn begins to fall to about er which the disease becomes more and more prevalent as the ature continues to sink, and again as beginning to rise towards ng of the year. On the average of years the largest number s was observed in the 21st week of the year, immediately after in the 22d week, the number of cases fell remarkably. The

following are the means of the meteorological conditions of the seven weeks about this time :—

—	Average of new Cases Two Weeks later.	Mean Temperature.	Mean daily Range of Temperature.	Mean Humidity.	Mean Rainfall.	Rainy Days 12 Years
		°	°		Inches.	
17th week	4·6	49·1	18·9	79	0·50	32
18th „ -	5·0	49·2	19·2	74	0·22	23
19th „ -	6·5	52·9	21·3	76	*0·67*	35
20th „ -	3·9	53·7	19·6	78	0·53	32
21st „ -	3·6	54·8	22·2	74	0·44	20
22nd „ -	3·7	57·8	21·1	76	0·82	33
23rd „ -	3·4	58·5	20·5	78	0·63	32
24th „ -	3·6	58·8	21·8	74	0·35	26
25th „ -	3·2	60·2	22·0	75	0·47	32
26th „ -	3·2	60·4	20·7	74	0·48	32
27th „ -	2·0	59·9	21·5	74	0·40	29

Reading this with the preceding table, it appears that the mean tem perature of about 52° is that which marks off the conditions favourab or unfavourable to the extension of small pox. A temperature bel this promotes its spread, and a temperature above it tends to check spread. It is clear, however, that this observation can only apply the country in which it has been made, or to one presenting simil climatic conditions.

Table VII. shows the more important meteorological conditions whi were existent in the several quarters in which small pox was more less prevalent. (See Table VII., pp. 75, 76.) From which it appears:-

1. That with the exception of the spring and summer quarters, the latter of which excessive heat is apt to check the spread the disease, small pox is promoted by a comparatively war season.
2. That in all seasons of the year comparative atmospheric dryness more conducive to the spread of small pox than comparati humidity of the atmosphere.
3. That in every season except the autumn, there was on the whole greater rainfall in the years of greater prevalence of small p than in those of its lesser prevalence.

I may add further, that making the fortnight's allowance for incub tion, great rises or falls of temperature appear to promote the extensi of small pox in seasons when it prevails. In this it resembles measle The alleged connexion between epidemics of small pox and measl may be studied upon the diagrams.

1. As regards the slighter small pox outbreak of 1860, it is observabl that although 1859 was not a year on which an epidemic of measles w due, yet, for a non-epidemic year, the disease was unusually prevale during the three first quarters; it subsided during the autumn, and sma pox broke out in the first month of 1860. As small pox subsided May and June, measles again became severely epidemic.

2. In 1862 a heavy epidemic of measles occurred, the principal vi lence of the outbreak being expended upon the months of June and Jul It subsided through August and September. In November the gra epidemic of small pox commenced, the disease spreading extensive in the month of December. In November and December measles b came concurrently active. It subsided, however, as small pox gain

gth during the early months of 1863. The chief violence of small in this year was expended upon the months of May and June, ig which the ordinary spring increase of measles was observed. The of 1863 and beginning of 1864 witnessed the reduction of small pox small number of cases, and in February measles again broke out, ommencement of a severe spring epidemic.

The slighter small pox epidemic of 1867 was again preceded by a y epidemic of measles in 1866, and its subsidence in 1868 by another y epidemic, lasting from May till the end of the year.

feel that in this paper I have only skimmed the surface of a very esting and important investigation, but perhaps it will be considered the inferences drawn are as much as the records at my disposal e for. Probably a deeper study of the diagrams may suggest others; es so to myself. The area from which the observed facts are n is comparatively a very limited one. I am conscious that my ences can only therefore be regarded as provisional. I am aware ut very few places in which a regular registration of sickness among poor has been attempted, and of no place where it has been steadily ied on for so many as 12 years, except in Islington. But I think ve indicated the important scientific results which would follow a national registration of sickness established. I can testify from rience how small the amount of labour would be in effecting such a stration in each district of the kingdom. At the present time there t everywhere abundant materials in the books kept by poor law ical officers, and at the various public institutions for the relief of ness, but they are unused because it is nobody's business to collect n together. Were this done it would be possible to distinguish veen the liability of different districts to diseases of certain kinds, the difference in fatality which attends them in different places. s is a matter of no small moment, since the causes which occasion ter or less liability to suffer from a malady may be very different n those which render attacks more or less fatal. Moreover, the laws ch govern the outbreak and spread of epidemic maladies might be rly brought out, and perhaps it may not be too much to anticipate in the progress of years facts enough might be collected on which ase a prognostication of disease.

---

he diagrams will now explain themselves. All that is necessary to add at the small figures below each weekly rainfall signify the number of s on which rain fell in appreciable quantity.

No. 4.—Report, by Mr. William W. Wagstaffe, on the Quantity and Kinds of Venereal Disease under Treatment at certain Charitable Institutions in London.

Venereal diseases: division of.

In the following report the term (A) *syphilis* has been applied to (1) the *infecting chancre* and its results, dividing these latter into (2) *constitutional* and (3) *hereditary*. The non-infecting or *soft chancre* (B) not producing any necessary effects upon the health of the individual or their children, but being a mere local disease, has been separated from the other venereal affections; and (C) *gonorrhœa* as being a disease distinct from the others, and of more or less special character, has been placed by itself. The term "*Venereal*" has been used to embrace all the above affections, syphilitic and non-syphilitic, which are traceable to contagion.

Doubtful cases excluded.

Cases of doubtful character have been excluded from the accompanying tables, but they were not in sufficient number to materially influence the results.

Line of inquiry.

In order to obtain a fair statement of the proportion of cases of venereal disease among the London sick poor, I have, in accordance with instructions, visited one or more of each of the different kinds of institutions which minister to the relief of such persons; general hospitals, special hospitals, dispensaries, and workhouse infirmaries. From the more important of these institutions I have, with the willing permission of the authorities, obtained the returns personally and am responsible for the diagnosis of the venereal disease in the cases upon which the tables are founded; and in other instances, where I was myself unable to attend, returns have been promptly supplied by the authorities or by trustworthy observers attached to the institution.

In regard to the cases included in this report, it may be stated that only those have been entered as venereal, where the disease for the relief of which the applicant presented himself was due directly or indirectly to some form of venereal affection, and no entry has been made of those who at some previous time in their lives have had one or other kind of such disease. In fact, it would be next to impossible to arrive at the truth if the latter line of inquiry had been taken.

Returns distinguished into departments,

It has been thought better to keep separate the returns for disease among out-patients from those referring to the in-patients of the different institutions, as the class of patients differs materially in the two cases, and also, since the returns which have been previously published on the subject have referred to special departments, to give the full statistics of the different departments into which the out-patient practice is divided.*

and according to sex and age.

It has also been felt desirable, in order to obtain a correct notion of the proportion of each sex affected with venereal disease, to distinguish males, females, and children as far as possible. This, however, was proved to be a difficult matter, for in none of the hospitals or institutions visited is this distinction ordinarily made. In the majority the returns are given under the two headings of "male" and "female," and the children in some cases are entered according to their sex, and in others are numbered with the women. In some institutions there is not even

* The tables printed in this report are summaries of more detailed tables also presented.

i distinction made, and a return is made in mass of the number of ·nts seen, regardless of their age or sex. The limit of age for ·ildren" for the purpose of the inquiry has been assumed at about ·r rather puberty, as (although in two instances acquired venereal ·se was seen at the respective ages of six and ten, one from rape) as considered that the age of puberty best marks the time below ·h the direct acquisition of any venereal affection is improbable.

In making these inquiries I have in the case of out-patients taken the ·portion of venereal disease among the whole number of patients pre- ·ing themselves during a definite time, one week at the large general ·pitals, and two or three days at the dispensaries, and have as carefully ·ossible avoided counting any patients, whether venereal or non- ·real, a second time, when they attended more than once during the that institution was under observation. In regard to in-patients, ·ve followed my instructions in taking the proportion of venereal ·ng them on single days only.

It seems to be the general opinion among the medical officers that the ·unt of venereal disease (especially among in-patients) is not so large ·e present season of the year (August) as during the winter months, the explanation given is that during the summer, and especially at ·present time, men and women do not care to give up the time neces- for treatment in or out of doors, when the plentifulness of harvest ·other work gives them the chance of earning good wages. This ·n, however, would account for a diminution in the total number of ·nts, as well as in those affected by the particular class of diseases in tion, so that the ratio of the one class of total sickness might be the as usual, except in one respect, viz., that a much larger proportion ·en would probably be drawn off by the summer full work, and as per-centage of venereal is much higher among them than among ·en attending as patients, in this manner the total proportion of ·real disease may be somewhat lessened during the summer season ·ng such patients.

Returns have been obtained from among out-patients at the following ·utions :— St. Bartholomew's Hospital, St. Thomas's Hospital, ·eorge's Hospital, for one week each ; Royal Free Hospital, for days ; Western General Dispensary, for two days ; Finsbury Dis- ·ary, for three days ; Farringdon Dispensary, for three days ; Surrey ·ensary, for 2 days ; Stanhope Street Dispensary, for two days.

Institutions under observation.

nd from among in-patients at the following :—St. George's Hospital, ·don Hospital, Royal Free Hospital, Female Lock Hospital, Male ·k Hospital, Lambeth Workhouse Infirmary, St. Pancras Workhouse ·mary. The returns from these, as before mentioned, have refer- to the patients actually under treatment on one single day in each ·tution.

Out-patients : (1) of General Hospitals.

Out-patients. General hospitals.—

·lthough not within the immediate objects of this inquiry, it cannot ·ut of place to give prominent notice here to the deficiency of reliable ·rds of the out-patient practice at all the public medical institutions ·ted.

Deficiency of reliable records.

·or the purpose of clinical instruction such records would be most ·able, and in fact are almost essential to that form of teaching, and ·quiries of the nature of the present one they would also be of the ·ost value. For either use, it is of course necessary that their cor- ·ness should be guaranteed by proper supervision. At the present

time none even of the general hospitals which were visited possessed the means of showing, with any approach to accuracy, the proportion of any kind of disease treated among its out patients. A rough entry-book was certainly sometimes kept, but the entries in this were, in the majority of cases, made by junior students, or else by non-medical officials, and in neither case was there any attempt at exactness. There appeared to be no one whose duty it was to overlook these records, or to compile any results from them.

For the following out-patient statistics, all the departments into which that practice is divided have been included; but it has seemed advisable, in recording totals, not to take into consideration the cases of primary accident, *i.e.*, those applying shortly after an accident has happened, as such patients are not of a class fairly comparable with the rest of hospital out-patients. The totals on the Out-patient Tables, relate, therefore, to patients suffering more or less directly from what may be termed "disease," in contradistinction to accident.

Tabulation of returns.

Six tables (I., Ia., Ib., II., IIa., III.) have been prepared from the results obtained from the out-patient practice of general hospitals and dispensaries. Of these, tables I., Ia., Ib., refer to general hospitals only; tables II., IIa. to dispensaries; and table III. combines the results obtained from the inspection of the total out-patients (9,363), seen at both classes of institutions. The different departments of out-patient practice at general hospitals, which have, for reasons before stated, been kept distinct, are as follows:—1. Surgical out-patients, under the care of the assistant-surgeon; 2, surgical casualties; 3, ophthalmic patients; 4, medical out-patients under the care of the assistant physician; 5, medical casualties; 6, special department for diseases of women and children; and 7, department for skin diseases. The sexes have been distinguished, and children separated from women, where such a course has been found possible.

Except where otherwise stated, the returns have been obtained by myself.

Sources from whence returns obtained.

The following are the points which it appears necessary to note concerning the specialities of the out-patient practice at each hospital visited; and here I desire to record the names of the gentlemen to whom I am indebted for assistance in each department.

St. Bartholomew's.—Five departments formed the subject of inquiry at this hospital, and I have to acknowledge with pleasure the readiness with which all the officers of the institution assisted me by giving information, and by putting their patients at my disposal for examination:—1, the surgical out-patients' department, under the care of the assistant-surgeon, and including the ophthalmic and aural practice; 2, the surgical casualty department. The patients here were very numerous, and were carefully tabulated by the house surgeon; 3, the medical out-patients were noted by the assistant physicians in attendance (Drs. Southey, Church, and Gee); 4, the medical casualties; and 5, the department for diseases of women and children included no cases of venereal disease, as such are at once transferred to the surgical authorities.

St. Thomas's Hospital.—Seven departments are recognized here among the out-patients. 1. The surgical out-patients under the care of the assistant-surgeons. 2. The surgical casualties under the care of the house surgeons and dressers in which the returns were rendered by the former. 3. The ophthalmic out-patients. 4. The medical out-patients, for the accounts of which I am indebted to Dr. Clapton, the assistant physician. 5. The medical casualties seen by the resident medical officer or his assistant. 6. The department for skin diseases, the returns from which are furnished by Dr. Bristowe. 7. The obstetric special children's department under the care of Dr. Barnes and Dr. Gervis, who supplied the returns for this department.

eorge's Hospital.—At this hospital five departments are recognized the out-patients. 1. The surgical out-patients under the care of the t-surgeons. 2. The surgical casualties comprise only accidents and at cases, and are therefore not taken into consideration in the statistics. the return of medical cases I am indebted to the kindness of the assistant ns (Drs. Dickinson and J. W. Ogle). 4. The women's special depart- nder the care of Dr. J. Clarke, showed no cases of venereal. 5. The mic out-patients.

proportion of venereal is rather less among the assistant surgeons' l out-patients than at either of the other two general hospitals, (14 per ainst 17 and 23 per cent.,) and this is more marked among the males of partment, for it will be seen that at St. George's 27 per cent. of males cted against 37 per cent. among the assistant-surgeons' out-patients at tholomew's and St. Thomas's.

al Free Hospital.—The surgical out-patient here comprised an lly large number of venereal cases in comparison with other general ls. At this institution there seems to be a tendency to make a speciality class of diseases, owing partly to the original associations of the place,* tly to the fact that the name and reputation of the hospital lead many ose no questions are asked and no trouble is necessary in order to obtain f an out-patient.

per-centage of venereal among the surgical males here rises to nearly ne out of every two seen, and for all sexes and ages in this department 4, or more than one out of three; while the total per-centage for all sexes partments among the out-patients reaches to over 17 per cent.

notes of the cases occurring on the medical side were made by Dr. , late of St. Thomas's Hospital, who was present during the four days titution was under observation and fully satisfied himself of the correct- the details collected.

ng the surgical casualties no cases of venereal occurred.

Out-patients (2) of Dispensaries.

Dispensaries.

urns were supplied from the following:—1. Western General sary, Marylebone Road, by Mr. John Waller, the Resident l Officer, 2. Finsbury Dispensary, Woodbridge Street, by Mr. J. May, Resident Medical Officer. 3. Farringdon Dispensary, Medical Officers. 4. Surrey Dispensary, by Mr. F. W. Smith, Surgeon. 5. The Public Dispensary, Stanhope Street, by Mr. Morris, M.B., House Surgeon.

Why proportion of venereal disease among these is small.

much smaller proportion of venereal disease is to be noticed in returns than in those from the general hospitals. The explanation, however, of this is apparent. In all the dispensaries, the production of a Governor's letter is necessary before a patient can be seen by a surgeon or physician, and a large number, if not the majority of patients are connected by ties of dependence with the donors of the letters. Persons suffering from contracted venereal disease will hesitate long for a letter under these circumstances with the almost absolute certainty of being asked by the governor the nature of their malady, especially when hospitals are at hand offering treatment without fear of disease becoming known elsewhere.

Hereditary syphilis.

The reason bears upon all dispensaries, and in addition there is among them a rule, expressed or traditional, that primary venereal cases are not fit objects for the charity of the governors.

The proportion of cases of hereditary syphilis at dispensaries may fairly be looked upon as more correct for sick children generally,

* hospital was founded ostensibly for the relief of the most destitute poor, who t get letters of recommendation to the other hospitals; and of this class of prostitutes formed a notable proportion.

nan at a large general hospital, where a comparatively larger · of acute cases is received, and where it is much more difficult, t the employment of special means, to separate accurately the r of children from the rest of the patients seen. It will be ed in the return that 4·83 per cent. of the sick children applied h isease traceable to syphilis in their parents.

Summary of Observations on Out-patients.

m the preceding tables it is evident that in the three general als (St. Bartholomew's, St. Thomas's, and St. George's), which ent most fairly the general hospitals of the Metropolis, a great nce exists in the several departments in regard of the prevalence nereal disease. By far the greater proportion appears in the al practice (including surgical out-patients, surgical casualties, and dmic out-patients) and a statement to the public of returns derived uch surgical out-patients alone would considerably exaggerate the ence of venereal generally among the sick poor of London. At artholomew's for instance, the proportion of venereal among al out-patients is over 23 per cent., whereas among the out- ts generally, excluding primary accidents it is just over 8 per .A similar difference is also observable at the Royal Free Hos- The returns from the dispensaries do not satisfactorily separate nedical from the surgical practice, but the same proportionate ence would probably not be found, as there is not usually the same en distinguishing between the two classes of cases.

At hospitals the proportion of venereal disease is very different in different departments of out-patients.

Close agreement in the returns from the general hospitals.

hough much larger numbers of patients always attend on the early of the week, I do not find that the proportion of venereal cases g them is appreciably different.

e three large general hospitals agree very closely as to their results t following per-centage figures will show.

Disease.	St. Bartholomews.	St. George's.	St. Thomas's.	Royal Free.
hœa - -	3·82	2·05	2·85	7·58
hancre - -	·80	·58	·52	1·67
lis - - -	3·51	4·59	3·71	7·92
real generally -	8·14	7·22	7·09	17·17

mpared with these the Royal Free Hospital presents a much larger entage, and the increase seems nearly equal in the three classes into h venereal disease is divided.

ne return from dispensaries gives a total of gonorrhoea 1·14 ; soft cre, ·43 ; syphilis, 2·19 ; giving a total per-centage of venereal, 3·78.

he total results of the foregoing returns from the out-patient depart- ts of different institutions collectively are embodied in Table III., by h it will be seen that of 9,363 out-patients in all departments of all charitable institutions visited, 8·71 per cent. were affected with real disease of some kind, and of these 3·68 were gonorrhœa, ·81 were chancre, 4·21 were syphilis.

turns of in-patients affected with venereal diseases in different as are not sufficiently comprehensive to afford a basis for any eductions. I have therefore simply given the results in the V. and IV a.—Table IV. showing the total numbers, and IV a. ortions per cent., and have not attempted to combine them. xtended inquiry would be necessary before a fair judgment of the m of venereal disease among the in-patients generally of London could be formed. The plan has been adopted of taking the umber of patients in hospital on a particular day, noting the of venereal cases found among them; so that the returns repre- proportion of venereal in hospital on a specified day.

In-patients.—Manner in which returns were taken.

e return from St. George's Hospital I am indebted to the surgical Mr. Wm. Leigh, and may state it is his impression that the propor- ne present time is rather below their average of such cases.

Sources from whence obtained.

London Hospital the returns were made by the registrars (Mr. Tay Woodman), and they too are of opinion that their present number of cases is smaller than usual. St. Bartholomew's and Guy's Hospitals nished no returns. At the Royal Free Hospital, there is an even oportion of venereal cases among in-patients, as compared with other hospitals than was noticed among the out-patients, but this is not g when of the only two female wards in the hospital one is exclusively e to venereal affections.

the two workhouses of Lambeth and St. Pancras, I have with the on of the authorities personally investigated the venereal cases among ates of the infirmaries, and the great difference in the results obtained some explanation. Lambeth shows a per-centage of 2·53 venereal the infirmary, while in St. Pancras it amounts to 10·6. In the Lambeth ry, however, the proportion of venereal to total diseases is due to the t a much larger proportion of cases of senile debility are lodged there St. Pancras; in fact, the excess in the actual number of inmates in h Workhouse Infirmary over those in St. Pancras is completely made atients suffering from old age rather than from any actual disease. In ner, the number of patients in the infirmary is 315 out of a total of 944 workhouse, while at St. Pancras (the old people being lodged else- only 132 out of 1,645 are infirmary patients. If the proportion of d cases to the whole number of inmates be taken, the results for the two uses would be found almost identical, being 0·84 per cent. for th, and 0·85 per cent. for St. Pancras.

PATIENTS OF SPECIAL LOCK HOSPITALS.

Special hospitals.

rder to obtain further materials for determining the quality of lent venereal disease, I have applied for and obtained returns the Female Lock Hospital and from the Male Lock Hospital gh the kindness of their respective medical officers, Mr. F. J. all and Mr. C. H. Lister.

. Berkeley Hill has also forwarded me a report of the out-patients his care, from the commencement of the present year to June

om these it would appear that the number of cases of gonorrhœa g in-patients at the special hospitals reported upon was proportion- much greater than any other forms of venereal. The out-patients not been classed in Mr. Hill's returns in the same manner, but ly into syphilitic and non-syphilitic, and show a proportion 41·5 per of the former against 58·5 per cent. of the latter. Tables setting n detail the facts about the nature of the venereal diseases treated ese hospitals accompany this report.

General Observations.

The foregoing returns have reference to the amount and kinds of venereal disease observed during a certain time at various charitable institutions in London; and it may not be amiss in conclusion to give an approximate of these proportions among the total sick poor of the metropolis.

Definition of the term "sick poor."

Confining the term "sick poor" to such as receive medical relief gratuitously at public institutions, and at the hands of the poor law administrators, it will be necessary, in order to obtain an idea of their numbers, to take them as follows: (A) those relieved at general hospitals, (B) those relieved at dispensaries and special hospitals, and (C) those receiving parochial medical relief.

Estimation of total numbers of sick poor of the metropolis.

The calculation of the total numbers relieved by these different means can only be an approach to the truth, for in many instances no returns are published or kept; in others there is no attempt whatever at accuracy; while at many of the charitable institutions there is a tendency greatly overstate the amount of real work done. From the actual returns where obtainable, and from other sources where no returns are available, it seems that the following will represent the total number of sick poor relieved during the year:

(A) At general hospitals, as shown by their returns	554,450
(B) At special hospitals and dispensaries, as shown by their returns - - - -	800,000
(C) By parish medical officers (calculated) -	180,000
Total - - - -	1,534,450

It appears further that those hospitals and dispensaries which have been the subject of this report minister to the relief of a very large proportion of the sick poor contained in classes (A) and (B)—as much,

in fact, as 25 per cent., or one-fourth. But it will evidently be incorrect to give the proportion of venereal diseases which occur among the patients (A) and (B) as the proportion of venereal diseases among t total sick poor of the metropolis. It will be necessary to add 25 p cent. of the parochial sick (C) before fair deductions can be made. would be a matter of considerable difficulty however to give the retu of this class of cases (C) with accuracy; it would require greater ti and labour than the results to be obtained would counterbalance. B I have computed it, I think not unfairly, by obtaining a return from ea of the medical officers of one of the largest unions (Lambeth). Fro these it would seem that 0·33 per cent. of the population, or one in 30 receive relief from the parochial medical officers in an average wee Taking the population to be about 3,000,000, it will follow that abo 9,900 are weekly under the hands of the parish medical officer, and or fourth of this number, or 2,475, must be added to the correspondi fourth of hospital and dispensary patients included in this repor Venereal in these parish out-patients is not treated by the parish doct but is accounted for in various hospital returns.

A week's return of one-fourth of the sick poor of London, showing the proportion of venereal cases among them.

The following will therefore represent a weekly return of the numb and proportion of venereal cases during about a week's observation in-patients, out-patients, and parish cases among about one-fourth of t whole population of the metropolis :—

Class of Patients.	Total Number reported on.	Number of Venereal Cases.	Proportion Venereal Ca per cent.
In-patients of hospitals, dispensaries, and workhouse infirmaries - - -	1,313	94	7·16
Out-patients of hospitals and dispensaries	9,363	816	8·71
Parochial out-patients - - -	2,475	0	0
Totals - - -	13,151	910	6·92

So that 6·92 will probably represent the per-centage of the sick po population affected with some form of venereal disease, syphilitic non-syphilitic.

Proportion of syphilitic and non-syphilitic cases arranged according to sex.

If we inquire a little further, and distinguish the non-syphilitic fro the syphilitic forms of disease, and separate men, women, and childr into different groups, we may obtain the following results :—

	Total.	Males.	Females.	Childre
Total number of patients reported on -	13,151	4,935	6,647	1,569
Of which there were suffering from				
(*a*) Non-syphilitic forms of venereal disease.	445	357	88	0
(*b*) Syphilitic - - - -	465	247	180	38
Totals - - -	910	604	268	38
Or expressed in per-centages :				
(*a*) Non-syphilitic - - -	3·38	7·23	1·32	0
(*b*) Syphilitic - - -	3·53	5·00	2·71	2·42
Total - - -	6·92	12·23	4·03	2·42

No. 4. *On the Quantity, &c. of Venereal in London Institutions, by Mr. W. W. Wagstaffe.*

is report be considered extensive enough (and it comprises about
's observation of presumably one quarter of the sick poor of
n) to warrant general deductions being made, it may be inferred
long the million and a half of poor population of the metropolis
ceive medical relief for disease at hospitals, dispensaries, work-
and at the hands of the parochial medical officers during the
nearly 7 per cent., or about 1 in 14, are affected with venereal
of some kind. These numbers, it must be remembered, do not
ne midwifery cases.

amount of true syphilis is slightly in excess of the non-infecting
of venereal disease, but the contrary holds good when men are
ered apart from women and children; for among this sex the per-
e of non-syphilitic stands at 7·23 against 5·00 per cent. of
's. By far the larger proportion of venereal disease is to be noted
the males, the returns showing three times as much among them
ong females. The proportion of hereditary syphilis among children
, I am afraid, be satisfactorily deduced from these tables, as no
have been reported in the parochial returns. In order, however,
in some data for a rough estimate of the quantity of hereditary
is among the sick children of the class that would frequent hospitals,
blished statistical returns of the Great Ormond Street Hospital have
examined, and it appears that of 118,590 children treated there
nd out patients during the last ten years, 1,786, or a proportion of
r 1½ per cent., are recorded to have been syphilitic.

No. 5. *On the Inoculability, &c. of Tubercle, by Dr. Sanderson.*

5.—Further Report by Dr. Sanderson on the Inoculability and Development of Tubercle.

my last report I expressed the opinion, in terms as definite as my
vations seemed to justify, that the disease produced by tuberculous
lation might be regarded as an overgrowth in the affected parts of
structural elements which they have in common with the pulp
ined in the alveoli of the lymphatic glands. I had also found that
tructural alterations in which the disease manifested itself were
rkably constant in their character and development—consisting of
Induration and suppuration of the subcutaneous connective tissue at
oint of insertion, attended with the formation of secondary nodules
duration of the same tissue in the immediate neighbourhood. (2.)
rgement, induration, and caseous degeneration of the lymphatic
ls in relation with the seat of primary infection. (3.) Appearance
odules in the lungs, having to the naked eye the translucent aspect
ey tubercle, though differing therefrom in structure. (4.) Enlarge-
of the liver, consequent on interstitial growth of new material
een the lobules. (5.) Hypertrophy of the spleen. (6.) Formation
rious parts of the peritonæal surface of nodules, consisting of ele-
ts anatomically identical with those naturally to be found in the
ted parts.

Summary of conclusions contained in last report.

s regards the conditions of infection, I had concluded from experi-
ts that in rodent animals the tuberculous process may originate not
ely by the inoculation of tubercle, but by any irritation of the requi-
intensity applied to the subcutaneous tissue, and that any external
ry, provided that the animal survives its immediate effects, is capable

of becoming the first link in a chain of pathological changes w
cannot be distinguished from those produced by the insertion of tu
culous material. In correspondence with this inference, I had fo
that in almost every animal inoculated, suppuration had occurred at
point of insertion, a fact which seemed to indicate that, however spe
might be the characters of the subsequent stages of the process,
characteristic phenomenon of common inflammation attended its or
Had abscesses been found at the seat of inoculation in every case, I sh
have been compelled to believe that the formation of pus was esse
But it was not so, for in some of the animals there were no abscesse

The facts from which I had concluded that tuberculosis may origi
traumatically, although very limited in number, were of so positi
nature that I ventured to state that the results of tuberculous inocula
could no longer be regarded as necessarily dependent on any proper
action possessed by the inoculated material in virtue of its having
taken from a tuberculous individual.* The truth of this inference
now been completely established by the experiments of two of the
competent observers, Dr. Wilson Fox, Professor of Clinical Medi
in University College,† and Dr. Cohnheim of Berlin. The follo
paragraph contains a summary of their results, which are the more v
able as they were arrived at altogether independently and wit
knowledge either of each other's inquiries or of mine.

Observations of Dr. Wilson Fox and Dr. Cohnheim as to the conditions of tuberculous infection.

From the tabular summary of Dr. Fox's experiments (117 in num
it appears that of 70 animals inoculated with various products de
from bodies of non-tuberculous patients, about half (34) became tu
culous. In addition, five animals were inoculated with putrid
originally healthy muscle, and four of them became in like ma
tuberculous, as was found when they were killed at various periods
84 to 122 days after inoculation. Of seven animals in which seto
other mechanical irritants were introduced under the skin, two bec
tuberculous.‡ This research, no less remarkable for the accuracy
completeness of the anatomical details than for the conclusiveness o
experiments, was followed only the other day by another in Be
which although of similar nature appears by internal evidence to
been conducted in entire ignorance that several of the question
vestigated had already been completely settled in England.
Cohnheim and Fränkel, for the purpose of obtaining an answer to
question, "Does artificial tubercle owe its origin to a specific virus
introduced into the peritonæal cavities of guinea pigs portions of va
tumours (carcinoma, sarcoma, condyloma, &c.), as well as of healthy

---

* With reference to the traumatic origin of tuberculosis in the guinea-pig, an
possibility claims consideration, namely, that of the influence of the air and o
organisms which it contains. It has not yet been proved that injuries, which
such a nature that air is completely excluded from contact with the injured par
capable of originating a tuberculous process. The following experimental results
indeed, to suggest that they may not be so. Setons steeped in carbolic acid were in
in 10 guinea-pigs on the 24th of September 1868, each animal receiving two. A
same time extensive fractures of both scapulæ were produced in five others, care
taken not to injure the integument. No tuberculosis or other disease of internal o
has resulted in either case.

† "On the Artificial Production of Tubercle in the Lower Animals."—Lon
McMillan & Co., 1868.

‡ It is of importance to note that all these experiments were completed befo
appearance of my last report.

§ Cohnheim and Fränkel. Untersuchungen über die Ueberträgbarkei
Tuberculose auf Thiere. Virch. Archiv. Bd. xlv. 1868, p. 216.

decomposed tissue. Subsequently they employed in the same way
ty of insoluble inert substances, such as blotting paper, charpie,
ercha, caoutchouc, vulcanite, &c. In those animals that survived
mediate effects of the injury, emaciation supervened sooner or later,
e animals eventually died with tuberculosis of the peritonæum,
pleen, lungs, and other organs, the morbid appearances correspond-
every respect with those described in my last report.

regards the bearing of these facts on the general question of the
and origin of tuberculosis, I concluded from my own observations
ere is no structural distinction between the artificial disease and
tubercle, so long as the term is confined, as all accurate writers
w accustomed to confine it, to miliary tuberculosis; but I con-
d it necessary to maintain a reserve as to its relation with the many
ogical processes which are spoken of as tuberculosis in the common
ge of practical medicine and surgery. In going so far the two
guished pathologists already quoted have fully agreed with me.
Fox says: "I must confess that sceptical as everyone must
urally at first feel on this subject, the cumulative force of the
lence in favour of the tubercular nature of these growths appears
ne irresistible. We are either dealing with tubercle, or we have
ore us a new and hitherto unknown constitutional disease of the
entia, consisting of growths which, in their naked eye appearances
l histological characters, correspond with all the essential features
ubercle in man; which occur not only in the organs which are the
osen seats of tubercle in man, but also in the same parts of those
gans; which have the same vital characters, and the same early degene-
ive cheesy changes, not suppuration nor acute softening, and with
marked characters sufficient to distinguish them from tubercle."*
heim says, "All the marks by which tubercle is characterized, as
ch, are present; the agreement of the product of inoculation with
man miliary tubercle could not be more complete than it is, whether
gard be had to its extended distribution, and to the great variety of
gans affected, (peritonæum, pleura, lungs, liver, spleen, lymphatic
nds, and even the choroid,) or to its macroscopical and micro-
opical characters."

the work done during the past year my first object has been to
lify and elaborate the pathological results comprehended in my former
rt, to confirm what was left imperfectly established, to elucidate
t was obscure, and to endeavour to bring the inquiry into more direct
ing on the most important of all etiological questions, that of the
in and development of tuberculosis in man.

Perfect identity of artificial tuberculosis with miliary tuberculosis in man.

has been already said that in the liver, lungs, and some other organs,
material which constitutes the new growth presents uniform struc-
l characters which, although they are met with in many other parts
he body, are most distinct in the alveolar pulp of lymphatic glands.
imply this resemblance I proposed to designate these characters by
word *adenoid*. My further inquiries lead me to believe, in the first
e, that these characters belong much more generally to tuberculous
wths than I had at first supposed; and secondly, that those normal
ues which possess them are much more liable to become the seat of
tuberculous process than others. To illustrate these points it will be
essary not only to refer to my own observations, but to render avail-
e all the discoveries which have been made during the last six or
en years which bear upon the question.

Structural characters of tubercle.

* Fox, loc. cit. p. 20. Cohnheim, l. c. p. 219.

The existence of the tissue in question has been for some ye recognized by all minute anatomists. Kölliker first described it un the term "*cytogene Bindesubstanz.*" For the more complete elucidat of its structure and significance, science is indebted to Professor His Basle, who first applied to it the term "*adenoide Substanz.*"* Ot histologists speak of it as *netzförmige* or *reticuläre Bindesubsta Zellengerüst*, &c. Kölliker defines the tissue generally as "a reticul "of stiff, pale fibres, comprising lymph corpuscles in its mesh "originating by the combination of branched cells, consisting neither "gelatigenous nor of elastic substance, but of an albuminous compou "soluble in caustic alkali, but not in boiling water."

Reticular cytogenic tissue is to be found in the lymphatic glands, in t spleen, in the neighbourhood of the ducts of the liver and of the bron in the serous and mucous membranes, and in the medulla of bone. proceed to refer to its character and distribution in most of th organs.

Structure of the adenoid pulp of the lymphatic glands.

The structure of the lymphatic glands has been understood by an tomists only for a short period.† A few years ago it was supposed tha lymph-gland consisted essentially in a network of finely-divided lympha vessels, compacted into a dense mass by cellular tissue, and abundan supplied with blood vessels. It was imagined that the afferent lymp tics divided into minute branches which, after forming an intric plexus in its interior, combined again to become the efferent vess Somewhat more recently it was recognized that the afferent lympha channels were not continuous with the efferent as such, but that th lost themselves in certain holes filled with cells, since called alveoli, fr which the efferent vessels took their origin. The first step toward more exact knowledge of the subject was taken in 1852–53, wh Brücke ‡ and Donders § showed that these holes were not mere dila tions of lymphatics, but that they contained structures of considera complication; that in addition to the lymph corpuscles, which were bef thought to be the sole occupants of the alveoli, each alveolar cavity permeated by a network of transparent fibres. They further show that this network is so arranged as to form a flask-shaped body (sin called by His an ampulla), the contour of which corresponds to that the cavity (alveolus) which it occupies, being, as it were, suspended in by delicate strings of transparent connective material which stretch acr the space between its outer surface and the inner surface of the alveol Thus the structure of the medullary substance of a lymphatic gland the part in which the alveoli are) may be described as follows: It consists of a number of flask-shaped cavities, communicati with each other by their necks, enclosed in a meshwork consisting beams and septa, all of which spring from the general capsular inve ment of the gland, and tend towards the hilus. These have for th

---

* Kölliker, Handbuch der Gewebelehre des Menschen, pp. 58 and 64. Prof. His, Beitrage zur Kenntn. der zum Lymphsystem gehörigen Drüsen, p. 65.

† If it were necessary to seek for a reason for introducing these details into t Report, I should find it in the fact that even in the later editions of English text bo of physiology the structure of the lymphatic glands is still described as it was kno to anatomists of 20 years ago.

‡ Brücke, Sitzungsberichte der Akad. der Wissenschaften zu Wien. March 18 p. 429.

§ Donders, Physiol. des Menschen, Band I. (Theile's translation), p. 318.

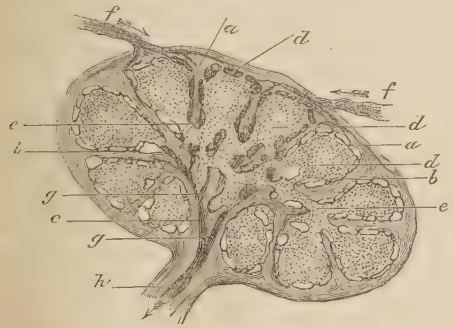
sive function to support and enclose the more important and more te structures which are contained in the alveoli, as well as the n vessels and blood vessels which belong to them. Thus the alveoli with the tubular channels of communication between them form many-chambered cavity, which cavity is occupied by a structure of me contour as itself, attached to it, as I have said, by innumerable ds or bands of extreme tenuity. This compound body might be ared to a bunch of grapes in which each little stalk joins some , instead of all combining to form one principal stalk ; the stalks ch receive the name of medullary cylinders), being attached to the unicating channels in the same way as the ampullæ are to the voli.*

ich being the general arrangement of the alveoli and their contents, mains to advert to their relations to the lymph stream, and the ation of lymph corpuscles, a subject which has a close relation to pathological process it is our present object to study. The ampullæ ell as the medullary cylinders consist of a network of extreme acy, the interspaces of which are entirely occupied by lymph cor- les. The ampulla is not covered by any membranous investment, only difference between the surface and the enclosed pulp being that ne outside the meshes are much smaller, and the minute fibres are h more closely felted together than they are towards the centre. is there any distinction, as regards the structure of the fibres them- es, between those which form the fine meshwork of the ampullæ those which form the fibres by which they are suspended to the rnal surface of the alveolus, excepting that the latter are somewhat oser.

'rom the examination of glands naturally or artificially injected it been ascertained that the afferent lymphatic vessels, after they etrate the capsule of the organ, spread over the surface of the

---

In illustration of the description in the text, the following diagrammatic section of lymphatic gland, copied from Frey, may be of service :—



capsule ; *b*, dissepiments between the *alveoli*, all of which are continuous with the capsule and converge at *c* towards the *hilus*: *d*, *ampullæ* ; each *ampulla* occupies an *alveolus*, to the surface of which it is attached by bands or threads, which cross the lymphatic sinuses ; *e*, medullary cylinders ; *f*, afferent lymphatic vessels ; *g*, efferent lymphatics, uniting at the hilus into one trunk, *h*.

adjacent medullary substance, finding their way immediately to the spaces surrounding the ampullæ and their connecting cylinders. How the lymph sinuses open into the numerous and minute lymphatic branches which combine to form the efferent trunks is not even now accurately determined. The fine network of the ampullæ is richly supplied with vessels, the arrangement of which in relation to that structure may be seen in Plate IV., Figs. 2 and 3 (see explanation). The arteries from which these capillaries derive their supply enter the reticular tissue by penetrating the medullary cylinders, and continue their course along the axes of these cylinders towards the ampulla, each being usually accompanied by a vein.

From the preceding short sketch of the anatomy of the lymphatic glands, which I have verified in its leading particulars in the lymphatic glands of guinea pigs, it appears that in their relation to the adenoid tissue which constitutes the ampullæ and cylinders, there is a complete antagonism between the lymphatic and blood circulation. Whereas the blood capillaries are richly distributed throughout the adenoid tissue, the lymph stream is separated from it by the densely felted fibres within which that adenoid tissue is comprised.

Adenoid pulp of Peyer's follicles and of the *Trachom-drüsen.*

It is now well known that Peyer's follicles have a structure which, although simpler, altogether resembles that of the ampullæ of the lymphatic glands. A Peyer's follicle is a mass of adenoid pulp of which the projecting part is covered by epithelium, while the convex under surface is surrounded by a lymph cavity, which can be injected from the lymphatic system, corresponding in every respect to the alveolar sinus of a lymph gland, the only difference being that whereas no epithelium can be detected in the latter, it has been distinctly made out in the former. Along the intermediate zone (so-called equator) the adenoid pulp of the follicle is continuous with the similar tissue of the sub-mucous layer. Peyer's follicles, like those of the lymph glands, are abundantly supplied with capillary blood vessels which have the same arrangement precisely as in the ampullæ.

Similar adenoid follicles are met with in other parts of the body. Thus in the conjunctiva there are globular masses of vascular cytogenic pulp (*Trachom-drüsen*), each of which is partly surrounded by a lymph sinus, just in the same way as the ampullæ of the lymphatic glands. In the adenoid follicles of the tonsils and in the follicles at the root of the tongue, which in every other respect closely resemble the others, this relation has not as yet been made out.*

Adenoid pulp of the spleen.

In the spleen we have an organ in which adenoid tissue exists in larger proportion than even in the lymphatic glands. Its relation, however, to the blood vessels is entirely different. It can be readily made out in the guinea-pig that, although the largest arteries are surrounded by common connective tissue, the rest are provided with sheaths of adenoid tissue which closely resemble the medullary cylinders of the lymphatic glands, and that the malpighian corpuscles are formed by the outgrowth of these cylinders into the form of spheroidal tubera, which either surround them or project from them laterally. As is well known, the arteries very rapidly divide, first into small arterioles and then into minute capillaries, some of which go to the malpighian corpuscles, others to the so-called pulp. Of this pulp all that can be said is that it is an exceedingly fine adenoid reticulum, which fills the whole of

* Bruch, Zeitsch. f. w. Zool. B. iv. p. 297, 1854.

re not occupied either by the malpighian corpuscles, or by ous channels which permeate the spleen in all directions. comes of the arterial capillaries in this tissue has been until open question, for it has long been recognized that they do not cate directly with the veins. The recent investigations of m to show in the most conclusive manner that they actually lose es in the adenoid reticulum through which the blood filters into merable venous channels which pass in all directions through . It is interesting as well as important to notice that in the ist as in the lymphatic glands, the three tissues of which it is ed are not separated from each other by any membrane. The rangement of the organ depends on the form of the reticulum, everywhere of the same nature, differing only in the degree of of the fibres and the size and form of the meshes, so that the m of the malpighian corpuscles, of the arterial sheaths and of , constitute but one framework continuous throughout.

l the instances hitherto referred to the adenoid tissue forms gans, the functions of which depend on the reaction of the tissue the blood or lymph which circulates through it. But there are rts of the body in which the same structure is to be found, not ted into masses of definite contour, but scattered in layers which most part lie underneath or form part of the skin and mucous us membranes. It is necessary to study these adenoid expan- ith reference to the reaction upon them of the tuberculous in- The field of research is so large that the view I am able to give must be necessarily incomplete.

Distribution of adenoid pulp in the mucous and serous membranes.

y last report I described certain bodies as existing in relation arteries of the omentum of animals infected with tubercle, in the nodules, varying indefinitely in size, the largest being compa- hempseeds. From the more minute and careful examination of hich I have since made, I have learnt that these visible granu- are strictly speaking not new growths but overgrowths, and that iginate by the enlargement of previously existing organs, not by elopment of any heterogeneous structure. These organs have tle noticed by anatomists. The only reference which I find to s in the last edition of Prof. Kölliker's "*Handbuch*" (p. 603), e describes certain globular prominences consisting of cells re- g lymph corpuscles along with proliferating epithelium cells, as to be found on the surface of the human peritonæum, and par- y of the *omentum majus*. Further, Dr. Knauff of Heidelberg, in y recent papers,* describes certain organs under the designation nphatic nodules," as constantly to be found in many parts of the membranes, and clearly recognizes the close relation between nd miliary tubercle. To these researches I shall have further n to refer, and content myself for the present with remarking y own observations were complete before I became acquainted em. It is probable that organs of the same kind exist not only in ura and peritonæum but also in synovial membranes, and they close relation with the villous structures which border the arti- artilages.

Peritonæal adenoid tissue.

he peritonæum of the guinea pig I have studied these bodies,

2528.

chiefly in those parts of the membrane which are the constant seat of tuberculous disease, viz., in the omentum and in the double fold of membrane which encloses the pancreas, and extends from that gland to the greater curvature of the stomach and the duodenum in its long course from the pylorus to the orifice of the pancreatic duct. These layers are continuous in front with those which in this animal go to form the omentum, a structure which differs widely from the omentum majus of human anatomy, both in its position and relations. Instead of stretching as a veil over the mass of intestines, it occupies a concealed position along the greater curvature of the stomach, to the convex surface of which it not unfrequently adheres. In order to examine these structures satisfactorily, the best method is to open the abdominal cavity from the front and fill it with serum or some other indifferent liquid. By this means the omentum, which is of extreme delicacy, can be made to float, and thus dissected out without risk of injury. My invariable plan is to sever the peritonæal attachments of the spleen and pancreas on all sides under liquid, and then to remove the two organs together, and spread the membranes on a large plate of glass for examination under the dissecting microscope.

The omentum consists in its most transparent parts of two layers of epithelium, enclosing a regular network of connective fibres, the meshes of which are remarkably uniform in size, measuring about $\frac{1}{100}$ of an inch. The epithelium is formed of cells with wavy outlines, each containing a spheroidal and finely granular nucleus. These cells cling closely to the fibres of the network, never extending over the empty spaces between them, in consequence of which the nuclei project visibly from the surface. The relation of the arteries and veins to the two essential elements of the structure, viz., the epithelium and the network of structureless transparent fibres, differs according to their size. The smallest vessels, whether venous or arterial, are in immediate contact with the epithelium (see Fig. 2, Plate VI.). The vascular wall is connected on either side with the fibres of the network, with the substance of which it appears to be intimately blended. The larger vessels are enclosed in sheaths, of which, although they vary considerably in their structure according as they are studied in the omentum or in the mesentery, two principal varieties may be distinguished, those which contain fat cells, and those which consist entirely of adenoid tissue. Of the first kind a complete idea may be gained from Plate II. Fig. 1, which represents a vascular anastomosis from the mesentery. Each artery with its accompanying vein is enclosed in a flattened cylinder, of which that part which is next the vessels consists of fat cells, whereas the external part is of transparent adenoid tissue which could not be distinguished from that of a lymph gland. Vessels of a size intermediate between those last described and capillaries lie in a mass of adenoid pulp, which sometimes forms a tubular sheath of uniform diameter, sometimes projects from the serous surface in the form of fringed appendages, extending along the course of the vessel, or spreading out between the epithelial layers.

From the masses of adenoid pulp which surround or fringe the vessels, to the adenoid nodules previously referred to, the transition is easy. These bodies are in fact collections of the very same material. They occur in the peritonæum in a variety of forms, of which the following are examples:—

Form *a*. Mere aggregations of cells, between the opposed layers of epithelium, not supplied with vessels. These occur very frequently in the omentum, in some parts of which they exist in great numbers.

them is shown in Plate II., Fig. 3. The lymph corpuscles are be embedded in the substance of the same transparent material of which the fibres of the omental network are composed, which come blended together into a hyaloid capsule of an oval form for ception. These non-vascular nodules are usually much larger e one represented, which was selected in order that the whole of t be comprised within the field of the microscope.

b. Collections of cells around loops of intermediary vessels. these is shown in Plate I., Fig. 4. An arteriole after leaving a trunk runs a short course between two opposed layers of ium, towards a mass of adenoid pulp. From this mass a vein than the artery returns by the same course.

c. An arteriole (Plate I., Fig. 1 *a*.) terminates in a labyrinth of ies not at all unlike a renal malpighian tuft, out of which the nerges, and after joining another vein from a similar tuft soon s way to a venous trunk. Other forms might be referred to, but l them are modifications of those already described. In intimate re the vascular sheaths and isolated masses are alike. All are ons of lymphoid corpuscles embedded in an extremely delicate m and covered with epithelium.

epithelium covering the adenoid masses is continuous with the l epithelial lining of the peritonæal cavity, but differs from it dly. Plate VI., Fig. 2, illustrates the fact that wherever a capillary or vein occupies the space between the two layers of epithelium, thelial elements not only become more or less oblong, but arrange lves in a direction parallel with that of the axis of the vessel. larger vessels lie immediately underneath the surface the same ement is observed. Fig. 4 on Plate II. shows the epithelium g an artery and vein, which are bordered on either side by an d, fringe. Over the whole of the fringe the epithelium can be , but it is seen that the form and size of the elements are different; of being large oblong plates with sinuous margins, they look like scales. This appearance corresponds evidently to the proliferated lium of Kölliker. It is to be found without exception over every f adenoid tissue when examined by v. Recklinghausen's method; preparations stained with carmine it cannot be recognized, the of the epithelial elements when coloured by that reagent looking y like lymph corpuscles.

relation of the adenoid tissue to the vessels has been investigated o methods. In some of the experiments, I injected a solution of ne containing one drachm in two ounces of water, about two hours killing the animal, into the peritonæal cavity, in the manner ed by Prof. Chrzonszczewsky of Kasan. The effect of this pro- remarkable; all the masses of adenoid pulp are coloured, so n those parts of the peritonæum in which they are numerous the e looks as if it were scattered with red dots. Under the scope it is seen not only that the lymph corpuscles are stained, but the veins leading from them are filled with carmine. These rances at first suggested that the distended channels were in truth ins but lymphatics, but on tracing them to their destination I soon ed myself of their real nature. By this method I also learnt that ver the adenoid pulp is in relation with blood vessels, it is itself supplied with blood. These capillaries are so large that when issue is examined in glycerine they often seem to constitute the mass, completely concealing the cells. Whether they communi- r not directly with the arteries, or like the venous channels of the

spleen receive their blood from inter-corpuscular spaces, seems to m be a question yet to be determined. With reference to it, it is to be no that the capillaries demonstrated by this method can always be tr into efferent venous trunks, but cannot, so far as I am able to obs be shown to be continuous with arterioles, and that the efferent ve are always either larger or more numerous than the afferent. In add another fact is to be borne in mind, which although mainly patholog may not be exclusively so, viz., that the veins leading from ade masses are, when the latter are excited by the tuberculous infec often filled with colourless corpuscles (see Plates I. Fig. 3, and V Fig. 4). So far as relates to the vascularity of adenoid tissue in diseased state, my injections of the diseased parts from the cœliac show that the tissue is richly supplied with arterial capillaries, arrangement of which cannot fail to remind one of the manner in w the arterial capillaries of the spleen are distributed to the sheat adenoid pulp. As regards the relation of the adenoid masses in peritonæum to the lymphatic vessels, I confess myself to be ent at fault. In applying v. Recklinghausen's method, I have faile discover any lymphatic channels, nor am I aware that anyone else met with them in this part of the peritonæum.

Physiological signification of the adenoid tissue of the peritonæum.

The above details render it possible to enter on the considerati the physiological significance of these masses. From their struc analogy to the splenic pulp, it is scarcely possible not to suppose they have similar functions, *i. e.*, that they are concerned in the elab tion of blood corpuscles, while, on the other hand, their resemblan the adenoid structures of the mucous membranes suggests that the probably concerned in absorption, and that they stand in the relation to the peritonæal cavity that Peyer's follicles and the re the adenoid tissues of the intestine do to the alimentary canal. latter view seems probable, from the similarity of the conditions u which they show signs of excited action with those which affect, corresponding manner, the lymphatic glands and the intestinal folli In animals that have died of acute peritonitis all these ade masses become soft, tumid, and enlarged.* If the smallest pos amount of tuberculous material, suspended in water, is injected into peritonæum, these organs undergo a more gradual hyperplasia, and e tually become tuberculous. This delicacy of reaction against an infec agent seems to me to be more easily understood by supposing that morbid material actually passes through the excited tissue than in other way.† In suggesting that the peritonæal adenoid masses, as as adenoid tissues everywhere, play an important part in the deve ment of the blood corpuscles, I am partly influenced by the observa already referred to, namely, that under certain circumstances not f determined, colourless blood corpuscles are contained in extraordi numbers in the veins leading from them, and partly by my inabilit think of any other final cause for their existence. I have been fur

* In confirmation of this statement, see an observation published by Prof Klebs since the above was in print, who has observed the same fact, but attribu to emigration from the capillaries of colourless blood corpuscles! Klebs, Hand der pathologischen Anatomie, 1869, p. 318.

† In confirmation of this conclusion I would refer to the following experim result (March 31st). In three guinea pigs inoculated 21 days previously, by injection of a drop of distilled water rendered turbid with pounded diseased lymph gland, no lesion was found excepting that the adenoid masses (Knauff's bodies) in anterior mediastinum were enlarged to such an extent that when the membrane spread out on a glass plate, they could be readily distinguished without the aid lens, as transparent beads.

rongly confirmed in my surmise since I have become acquainted

bject.*

ie alimentary canal adenoid reticular tissue is very generally
ted underneath the mucous surface, and wherever it occurs it
portant relations with infective morbid processes. In addition to
licular glands analogous to those of Peyer, which have been
referred to,† there are masses or layers of the same material in
ous membrane of the fauces and pharynx as well as in that of
ll intestine. In the latter situation, indeed, adenoid pulp con-
the great bulk of the mucous tissue, forming a continuous
the deep surface of which is separated from the muscular fibres
connective tissue and vessels, its upper limit being the so-called
nt membrane of the epithelium, with reference to which it is
own that it is not in any true sense a membrane, but is merely
superficial condensation of the delicate reticulum which per-
ie whole mass. Everywhere throughout the small intestine the
pulp is in relation with the submucous network of lymphatic
s, which over the whole of the villous portion of the small
e are of great width and exceedingly numerous.‡

mucous membranes which line the respiratory cavities, and par-
the pulmonary air tubes, possess no adenoid tissue resembling
the alimentary canal. In the guinea pig, as in other mammalian
, longitudinal elastic fibres and transverse muscular fibres lie
rately underneath the epithelium of the bronchial tubes, outside
h comes a layer of common connective tissue, in which more
mperfect cartilaginous rings are enclosed. Anatomists have not
d any glandular structures excepting the acinous mucous
which occur here and there beneath the mucous membrane of
er bronchi.

Distribution of natural adenoid pulp in the healthy lung.

y former report I stated that in the irongrey nodules which
om tuberculous inoculation two kinds of cells are met with,
large nucleated cells which I identified with those naturally
d in the alveoli, and smaller bodies not much larger than blood
es, which I regarded as the essential elements of the morbid
. Following out the line of inquiry which my observations as to
lopment of tubercle in the peritonæum had suggested, I devoted
tention to the examination of the healthy lung in the guinea pig,
purpose of ascertaining whether or not masses of adenoid pulp
e found in it, particularly in those parts which appear to be the
e starting points of tubercle.§ From the examination of a number
nens, I have ascertained that masses of cytogenic tissue of irre-
rm are always to be found in the neighbourhood of the bronchi.
hich are in relation with the smaller branches lie in the loose

only structures containing adenoid tissue which have been referred to by
s as existing in the lung are the so-called *glandulæ pulmonales* (lymphatic
the neighbourhood of the larger bronchi).

common connective tissue by which these tubes as well as the blood vessels are separated from the air cells, while those which lie near bronchi of sufficient size to be possessed of cartilages, are found to lie in a corresponding position outside of the fibrous layer in which the cartilages are embedded. In every instance I have found the adenoid masses occupying a position between the air tube and the nearest artery, with the outside of the adventitia of which the surface of the mass is usually, if not always, found in contact. It was never, however, observed that the arterial adventitia was in the slightest degree modified, so that the mass could not be regarded as a development from that structure. It is further to be noticed that in injected lungs the masses were found to be vascular, minute capillaries not only ramifying on their surface, but penetrating into their interior. I am unable to state anything from my own observations as to the relation of these bodies to the lymphatic system ; but inasmuch as they lie in the course of the absorbent vessels (see p. 116), I have no doubt that they are in direct relation with the lymph stream. (See Plate V., Figs. 2 and 3, and Plate VIII., Fig. 3. From their position relatively to the bronchi and arteries, it became evident to me that these normal masses of adenoid pulp correspond anatomically to the much larger abnormal collections of similar material which in my last report I described as peri-bronchial granulations.

In the liver, strata of adenoid pulp are also to be found in the healthy condition of the organ, the distribution of which is analogous to that which I have described above. The tissue stands in the same relation to the branches of the portal vein and the bile ducts that it does to the pulmonary arteries and bronchi. I have not, however, as yet met with definite masses like those which are to be seen in the lungs, nor am I able to state how far the tissue can be traced along the ramifications of the portal ducts. It cannot, I believe, be demonstrated in the intra-lobular spaces.

Additional Observations as to Tuberculosis of the Lymphatic Glands.

I have now to bring the anatomical facts stated in the preceding paragraphs into relation with the morbid processes which constitute tuberculosis. In doing so, it is clearly most advantageous to consider those which have their seat in the lymphatic glands and in the spleen, not merely because I gave only a general and preliminary account of them in my last report, but because the reaction of the tuberculous infection on the *normal* adenoid tissue of which these organs so largely consist, is the type and pattern of the changes to which the similar *adventitious* tissue is subject elsewhere.

The diseased conditions of the lymphatic glands (excepting so far as their rough pathological anatomy is of practical interest to the surgeon) have been very little studied, so that in beginning the investigation of any of them one is breaking new ground. The reason why so little is known of the subject is obvious ; until lately their normal structure was not understood even in its broad outlines.

My dissections have all been made by the process first, I believe, employed by Billroth, about ten years ago, and subsequently so successfully and so extensively applied by His, to the investigation not only of the structure of the spleen and lymphatic glands, but of many other organs—the method of pencilling out thin sections of the hardened tissue with a sable brush held vertically. Fresh sections of the spleen or lymphatic glands, whether prepared with the double-bladed knife or otherwise, show absolutely nothing of the structure. All that can be seen is a confused mass of cells. Sections of the same organs, after hardening

ic acid or alcohol, are much more instructive, but still the
s embarrassed by the innumerable multitude of cells, which seem
packed that there can be no room for any other elements.
lling such a section in the manner above referred to, a vast
f these bodies are removed, whereas, if proper care is taken,
ulum in the meshes of which they are contained remains un-
The application of this method in the investigation of the
ne glands is specially valuable, for it affords a ready means of
ating the two principal textures which enter into its composi-
medullary and the cortical—and of bringing into view the
with their surrounding lymph-sinuses.

mphatic glands are subject to two distinct morbid alterations
culized animals, both of which were referred to in my former
affecting subcutaneous and internal glands respectively. The
eous glands are affected only secondarily, that is, in consequence
changes going on at the seat of injury, consequently none of
come diseased excepting those that receive tributaries from
parts. The morbid changes produced are more or less acute
to softening and suppuration. The alteration consists in
s and rapid enlargement of the organ, consequent on multipli-
cells. The alteration appears to affect all the parts of the
ke, but does not in its early stages alter its structure. It
said to consist primarily mainly in congestion, and in the
ation of cells in such enormous numbers as to destroy the con-
of the gland. Minute collections of free cells (purulent foci)
disseminated throughout its substance, by the confluence of
ne whole is converted into an abscess. In the meantime the
f the organ becomes thickened by the interstitial development of
nective tissue, within which may usually be found a layer of
stance, which instead of softening has undergone the gradual
f induration to be immediately described.

internal lymphatic glands the origin of the morbid alteration
tertiary—that is to say, it is a consequence of secondary
xisting in the organs from which they receive their afferents.
erations are chronic in their character, and are never attended
uration. I have studied them principally in those glands which
he lymphatics of the liver, and are situated in the *ligamentum duodenale*, close to the portal vessels. The changes observed
following nature. In the early stages nothing is seen excepting
alveolar reticulum is perhaps somewhat coarser than it should
ate IV., Figs. 1 and 2.) All the constituent parts of the organ
adily distinguished from each other, and the lymphatic sinuses
e pervious and in a natural state. The further progress of
ation is marked by the diminished distinctness of the structure.
es more and more difficult to distinguish the alveoli from the
r tissue by which they are separated from each other. This
o arise from two distinct processes. In the first place, cells are
d in great numbers in the fibrous tissue which constitutes the
capsule of the organ as well as the septa or partitions which
the alveoli from each other. These cells differ from the or-
mph corpuscles in their larger size, and in the fact that most
are distinctly nucleated. They are arranged in round or oblong
nclosed in the meshes of the fibrous tissue, or more properly
, in cavities which they have made for themselves. In this
trabecular tissue loses its natural compactness, and assumes the
of a spongy reticulum, the interstices of which, however, are

much larger than in that of the alveoli. In the ampullæ a char occurs which at first sight appears to be of an opposite nature. T slender fibres of the alveolar reticulum become coarser. Towards centre of the ampullæ this thickening seems to affect all the fib equally, so that a fine network of threads is converted into an equa fine network of transparent cords, the holes of which, notwithstandi the general enlargement of the whole mass, are much smaller than th were before. Towards the surface of the ampullæ the process cons in the formation of irregular bands of fibrous material traversing original tissue at various distances and in various directions, by wh the lymph spaces are obliterated and the whole converted into a coa sponge, and thereby assimilated to the altered cortical tissue with wh it is continuous. All this might be expressed more shortly but less co pletely by saying that the whole of the medullary part of the gla becomes the seat of fibrous degeneration, which, while it princip affects the dissepiments, extends from them to the alveoli, convert all the affected parts into a fibrous sponge in the interstices of which contained cells usually larger and more distinctly nucleated than lym corpuscles.

Up to this point the altered gland tissue is still supplied with blo for in specimens of which the arteries are injected it may be seen to pervaded with vessels in all directions. The vascularity, however, i believe confined to the trabecular tissue, for the fibrous degeneration the fine tissue of the ampullæ necessarily involves the obliteration its equally delicate capillaries, or rather their conversion into fib bands indistinguishable from the rest of the tissue. The part which corpuscles take in this process of fibrous transformation must, I ven to think, be exceedingly subordinate. In the ampullæ the natu lymph cells totally disappear, so that in those parts of the gland which the fibrous change is most complete there are no cells whate as one may easily satisfy oneself by the examination of unpencil sections. In those parts where there are still heaps of cells contained the meshes of the sponge, these appear to have nothing to do w the development of the fibres which surround them. The ultim result of the process is caseation, *i.e.*, slow necrosis. The fate o cells is to die, of the fibres to become opaque and granular. W this happens scarcely needs explaining. For even if we refuse to adm that an adventitious tissue is in itself less alive than the tissue wh it replaces, the mechanical effect of such a transformation as i been described must be to produce anæmia and consequently slow dea As to the chemical nature of the material deposited I have little say. It is very translucent, never striated or granulous, and is ve readily stained by solution of carmine.

The relation of the morbid process to the functions of the organ scarcely be doubted. From the moment that the intra-alveolar netw becomes transformed into ordinary fibrous tissue, all activity must be an end; as the degeneration progresses the lymph stream must be entir stopped, and all the tributaries leading to the gland obstructed. T in every case in which a diseased organ induces fibroid degeneration its lymphatic glands, those glands must react on the organ itself obstructing its lymphatic capillaries.

The changes which occur in the spleen correspond so closely w those observed in the lymphatics, that they scarcely need a separa description. The development of the disease is divisible into two sta It begins, as in the lymph glands, by a rapid cellular proliferation, consequence of which the organ increases enormously in size. T

ation of cells occurs, as I stated last year, principally in the n corpuscles, in consequence of which these bodies become lly prominent and obvious, and assume in every respect the t and appearance of miliary tubercles. By the overcrowding of l the blood vessels are compressed, so that the central parts e mæmic and undergo caseous degeneration. Eventually the ndergoes a fibroid degeneration, the characters and results of e similar in every particular to those already described in the e glands. The pulp and the malpighian corpuscles, which in the g are remarkably well developed, especially underneath the urface, and form by far the greater part of the bulk of the organ, ome indistinguishable. This blending of dissimilar types of takes place just as in the lymphatic glands. On the one hand ule is everywhere thickened, and here and there bulges out into rominences in consequence of the irregular growth of groups n the interstices between its fibres, while on the other the bands formed fibrous material spread in every direction through the he final result of the transformation resembles that which I have lescribed so closely, that if it were not for the more regular ent of the trabeculæ it would be impossible to discriminate sections of the two organs (see Plate VII., Figs. 5 and 6).

Additional Observations as to Tuberculosis of the Skin.

the primary local effects of inoculating tubercle or of introducing itants into the living tissues of the guinea pig so as to induce osis, results of great importance have been recorded by other s,* and particularly by Dr. Fox, since the date of the last report. 'ox's experiments the foreign matter was inserted under the skin. ts that the most common local result is the formation of masses matter which are dry and friable, ("débris of fattily degenerated ,") and are enclosed in capsules of firm semi-transparent and lardaceous appearance. But in addition to these encapsuled of caseous matter, he states "there are small granulations g in size from that of a poppy seed to that of a hemp seed, are irregularly scattered for a variable area in the subcutaneous ." With respect to these masses, which are sometimes semi- ent throughout, and sometimes have opaque centres, he remarks hey present a striking resemblance to the naked eye, and also the microscope, to the changed lymphatic glands." The account of their minute structure may be summarized as follows:— denser and more central parts they consist of nuclei embedded omogeneous tissue, in their less dense parts "a fibrillated tissue forms bands or trabeculæ between which the cells lie," the rming a structure which has "the strongest resemblance to the ntary composition of a lymphatic gland, or to the cytogenic of His." "Throughout the granulations many of the cells lso of the nuclei are seen in various stages of fatty degeneration. at is sometimes in visible drops, sometimes in a finely molecular The change is most common towards the centre of the granu- s, but it is also seen in cells irregularly scattered through the ent tissue."

ese subcutaneous granulations but little notice has been taken

* Klebs, Ueber die Entstehung der Tuberculose u. ihre Verbreitung im Körper. , B. xliv. S. 242. Langhans has introduced the infective material beneath the iva of the eye, Klebs and Cohnheim into the peritonæal cavity. I have been obtain a copy of Langhans' researches which are contained in an inaugural on.

by other observers.* Their importance was overlooked in the accou given of the local changes in my last year's report. Investigatio which I have made with special reference to this subject enable me confirm in every particular the accuracy of Dr. Fox's details. animals that have been inoculated from three to four weeks wi material taken immediately after death from the bronchial glands other tuberculized animals, the only morbid alteration which can discovered consists in the existence of a knot of hardened and thicken skin. On making a section of the diseased part, and examining it w a lens, it is seen that the hard mass lies immediately under the tr skin, of which in fact it seems to form a part; and that it consists an aggregation of smaller masses, separated from each other by more less irregular bands of connective tissue. At a later period, that is say, seven or eight weeks after inoculation, other nodules are found the neighbourhood of the original one, which, excepting that they a more disseminated, resemble the little masses already referred to, ea being enclosed in an indistinct capsule of reticular connective tis similar in character to that which enters into the composition of t nodule. On examination of the smallest of these granulations in t recent state, nothing can be discovered excepting that it is a mass round cells like lymph corpuscles. In sections of hardened tissue it found that these corpuscles are enclosed in a fine meshwork of fibres. have never seen this meshwork comparable in fineness to the alveo reticulum of a healthy gland, from which, indeed, it differs in sever important particulars. Not only are the septa thicker and coarser, l even in the smallest and presumably youngest granulations each cavit large enough to contain several cells, whereas in the ampullary netw the threads are never further apart than the diameter of a single corpu If, however, the comparison be made between the adventitious tissue the coarser network which occupies the lymph sinuses in the lymph glands, the resemblance is much closer, and it is still more striking regards a lymphatic gland in incipient fibroid degeneration; so compl indeed, is the correspondence of structure that the two are indistinguis able under the microscope. (See Plate VII., Figs. 3, 4, 6.) The which occupy the spaces between the fibres are for the most part simila lymph corpuscles; in some no distinction can be seen between nucleus cell, while in others there is a nucleus surrounded by a mass of less re tive matter, not much larger than itself. In addition to these ordi lymph corpuscles I have always found a certain number of much lar nucleated cells, exact representations of which are given in Plate VI Fig. 3 *a. b. c. d.*

In pencilled sections of single nodules it is found that the meshes the network are much smaller in the centre of the granulation than a its periphery, so that in the latter situation there are open spaces crossed by fibres of the reticulum, large enough to contain a considera number of corpuscles, which can be as easily pencilled out of them out of the medullary lymph spaces of the lymphatic glands. Of t relation of these subcutaneous nodules to the lymphatic capillaries regret to say that I know nothing, as I have altogether failed to m these vessels in the diseased tissues. Guided by the analogy of t adventitious to the natural adenoid structures, it seems extrem probable that the lymph stream passes through the peripheral netwo of the nodules in the same way that it does through the sinuses of t lymphatic glands. Sections under a low power show very distinc

* Professor Lebert makes some reference to them in his paper on the communi tion of tubercle to animals in Virchow's Archiv., vol. xliii. They are also vagu referred to by Villemin.

Observations relating to the Lymphatic Capillaries.

ne publication of v. Recklinghausen's researches in 1862* it was n by what sort of channels the lymphatic system commenced. w tissues in which anatomists had succeeded in filling them tion, most observers, including Brücke and Ludwig, regarded nere interstices not lined by any membrane. v. Reckling- ot only proved the existence of lymphatic capillaries but ated their structure by the method to which I have already ion to refer. This method consists in subjecting the tissue to n of an extremely weak solution of nitrate of silver (either by or imbibition) for a few seconds, and then exposing it to the which means the chloride of silver first deposited in the substance elements of the tissue assumes a reddish-brown colour. When od is successfully applied to the examination of the lymphatics, of dark-brown lines, (see Plate VIII., Figs. 1 and 2,) is nto view; these lines correspond to the edges of the epithelial more properly to the interstitial cement which separates them n other.

rangement and structure of the lymphatic capillary channels been satisfactorily made out in almost all the internal organs—in (Wywodsoff), in the liver (MacGillavry and Chrzonszczewsky), mucous membranes (His and Frey), in the pleura (Chrzon- y, Afonassiew, Dybkowsky), in the peritonæum (v. Reckling- nd Schweigger-Seidel). With respect to the last-mentioned s, the original discovery of v. Recklinghausen that the serous ommunicate with the lymphatic vessels, has been confirmed by vations of Schweigger-Seidel and Chrzonszczewsky as regards unication of the peritonæum with the superficial network of the c capillaries on the under surface of the diaphragm, by Dyb- as regards the costal pleura, and by Afonassiew as regards the ry pleura ; so that there can now be no doubt that these great play a most important part, not only in the physiology of absorp- in the diffusion and distribution of infective materials.

already stated that in the skin I have entirely failed in tracing tion of tuberculosis to the lymphatic capillaries. Professor f Berne), however, has been more successful.† His observations, few in number, are clearly of great importance in their bearing uestion whether or not the absorbents are to be regarded as the by which tuberculous infection is conveyed. His principal ex-

ecklinghausen, Die Lymphgefässe und ihre Beziehung zum Bindegewebe. in, 1862.
s, loc. cit. p. 285.

perimental results are as follows: a liquid consisting of finely comminuted cheesy tubercle from the lungs of a phthisical patient was injected in extremely small quantity with a hypodermic syringe into the peritonæal cavities of three guinea pigs. They were killed at periods of 26, 43, and 70 days after inoculation. In the first, miliary tubercles were found in the peritonæum at the point of insertion, in the serous investment of the liver, spleen and kidneys, in the diaphragm and in the lungs. In the second, the peritonæal lesions were similar but more extensive, in addition to which the mesenteric and bronchial glands were also diseased. In the third animal some of the organs affected in the preceding cases, and particularly the lungs, were free from disease, but the alteration of the bronchial glands was much more advanced, from which he concluded that they were infected directly from the diaphragm. In each case Klebs applied the method of v. Recklinghausen for the investigation of the condition of the lymphatics. It was found that the nodules which were confined to the peritonæal surface, were smallest and most numerous on the *centrum tendineum*. In the most minute of the miliary granulations a very distinct relation could be traced between the arrangement of the cells of the new growth and the rectangular network of lymphatic capillaries, (discovered by v. Recklinghausen,) which lies under the epithelium. It was observed that wherever there were tubercles the network was interrupted, and that the smallest tubercles were often situated at the junction of several lymphatic channels. The author admits that the tuberculous mass spreads into the intermediary substance (*Grundsubstanz* of v. Recklinghausen), between the lymphatic channels, but states that at the edge of each granulation it "streteh out in processes," each of which corresponds to a lymphatic channel within which he infers the new growth must have originated. He further believes that the epithelium of the lymphatic capillaries, which here and elsewhere consists of oblong plates with wavy contours, each containing an oval nucleus much smaller than itself, is transformed into "tubercle corpuscles;" or in other words that there is a proliferation of the lymphatic epithelium, similar to that which Rindfleisch * supposes to occur in tuberculosis of the omentum—the newly-formed cells first filling the lumen of the vessel and then bulging it out so as to take the place of the intermediary substance.

On the 24th of October I inoculated several guinea pigs by the method employed by Klebs. In three of these animals which were examined respectively on the 9th of January, the 19th of February, and the 10th of March 1869, I had the opportunity of verifying the perfect accuracy of his description, so far as relates to the distribution of tuberculous granulations on the peritonæal surface of the diaphragm; but I have been unable to trace any indication of the origin of lymphoid corpuscles from epithelial elements.

The results of my investigation of this question are as follows: The arrangement of the lymphatic vessels in the *centrum tendineum* depends upon that of the two tendinous layers of which the aponeurosis consists. Of these layers, the lower, which is the strongest, consists of fibres having the same direction as those muscular fibres of the diaphragm which take their origin from the ribs; so that they converge backwards and towards the middle line. The upper layer, which is much less distinct, has the same general direction as the muscular fibres which are inserted into the posterior edge of the central tendon. The fibres of the inferior layer are divided into bundles by splits or intervals of sufficient size to be visible to the naked eye. The lymphatic vessels of

* Rindfleisch, Lehrbuch der pathologischen Gewebelehre, p. 221.

æal aspect of the aponeurosis present themselves in two (Sinuses or lacunæ, which lie immediately underneath the of the peritonæum, embedded as it were in the basement (*Grundsubstanz* of v. Recklinghausen). (2) Radiating hich occupy the spaces between the tendons. The lacunæ most various forms ; they are scattered very irregularly on surface of the central part of the aponeurosis, occupying a er than that of the intervals which separate them from each Plate VIII., Fig. 1.) They communicate by tubular channels m a kind of plexus underneath the epithelium. Both the l the channels of communication are lined with an endothelium eauty and regularity, consisting of plates which differ from he veins and arteries in their larger size and remarkably tlines, a peculiarity of form which renders it impossible to em for any other epithelial structure in the body. They com- directly with the deeper layer of intertendinous radiating eady mentioned, by which the lymph is conveyed towards of the aponeurosis, there to be discharged into larger lym- nks which, according to Ludwig and Schweigger-Seidel, tend ie anterior wall of the thorax, and thus find their way to the ict. It is evident that if Professor Klebs is right in supposing uberculous new growth is either contained in the lymphatic or springs from their walls, the distribution of the diseased the tuberculized diaphragm must correspond to the arrange- ymphatic vessels above described. My investigations afford t to this supposition. They show (1) that as regards the nediately underneath the epithelium, the arrangement of the r granulations has no relation to the lymphatic lacunæ ; and he radiating intertendinous lymphatics never contain collec- mph corpuscles. The origin and growth of granulations on the face of the diaphragm consist here, as in the rest of the m, of the multiplication of corpuscles already existing and part of the affected tissue. By the examination of numerous iaphragms, I have ascertained that normal adenoid tissue, the usual characters, and differing in no respect from that nstitutes tuberculous granulations, is to be found under both serous membrane, and that it exists in such abundance in the hood of the superficial veins on the peritonæal surface of the is that it forms sheaths to those vessels. These sheaths are t and well marked, that in diaphragms not stained but merely transparent by steeping in glycerine, the course of the veins ced as opaque lines when the membrane is examined under a ; the adventitia of the superficial arteries presents no such es.

espondence with these facts as to the natural adenoid pulp I it in the animal examined on the 9th of January, all the granulations which existed on the peritonæal surface of the n were in relation with vessels, and that in the smallest granu- could be distinctly seen that the new growth sprang not from ntitia of an artery, but from the adenoid sheath of a vein. later dissections it appeared that each granulation eventually bove the surface of the membrane, first as a rounded elevation, wart or papilla, being finally converted by the flattening of its a round disc attached by the middle of one side to the surface embrane ; the other side being in contact with the opposed f the liver. If other evidence were wanting that the tuber- w growth does not originate from the walls of the lymphatic

vessels, it might be found in the fact, that although the distribution those vessels on the upper and under surface of the membrane is entirely different, the granulations found on the pleural surface were numerous as those on the peritonæal and had the same arrangement.

Additional Observations as to the Structural Changes observed the Liver.

The structure of the liver of the guinea-pig resembles very clo that of the rabbit, which has been minutely studied by Hering,* hardened livers it is easy to demonstrate the arrangement of the in lobular capillaries. In sections at right angles to the intra-lobular they are seen to converge from all sides to the axis of the lobule. tremely numerous near the periphery of the acinus, they diminis number towards the centre, by the repeated confluence of two into Consequently all the capillaries tend towards the axis, so that in e section cut longitudinally the direction of the blood stream may be rea determined. Thus the capillaries may be regarded as a framewo radiating cylinders in which the liver substance is contained, f up the whole of the space not occupied by the vessels; when necessarily follows that the liver substance, although in every s parallel to the general direction of the vessels, it looks as if it divided into separate masses, cannot really be so ; and that in reali must form a network of columns of cells, which, as regards the spa occupies is complementary to that formed by the capillaries. T columns do not (as appears to be the case in the rabbit) cons single rows of cells; for it is almost always seen, when they are cut a that at least two cells are divided.

The structure and mode of origin of the bile ducts, from their importance in relation to morbid changes, require special consider In the guinea pig the smallest bile ducts are cylinders $\frac{1}{1100}''$ in dia with lumina measuring $\frac{1}{4000}''$. Each consists of a membranous enclosing nucleated cells, the nuclei of which are of the same si those of the liver cells, and closely resemble them. In general terminal tubes are to be met with only in the inter-lobular spaces they can be often seen to penetrate into the peripheral masses of In certain laminar expansions of liver substance which are to be on the outer surface of the portal lymphatic glands, I have been a observe that these ducts lined with epithelium sometimes end in drical columns of true liver cells, the arrangement of which, alth much less regular than that of the epithelium, shows distinctly that surround an axial channel. In this case the relation between th thelial and gland cells corresponds completely to that which hol reptiles. In these animals the glandular cells form cylindrical col the constituent elements of which are arranged like epithelium regular and symmetrical manner round the axial duct. No such arra ment can be traced in the lobules of the guinea pig's liver, for her acinous type of structure so predominates over the tubular that latter is wholly indistinguishable. In the guinea pig the arrangeme the intra-lobular ducts is no doubt the same as in the rabbit, in w Hering has shown that they are minute channels hollowed out, as it w in the walls of contiguous cells. These channels run in a direc parallel to that of the radiating capillaries, and are connected with e

* Hering, Ueber den Bau der Wirbelthierleber, Sitz.-Berichte der Wiener A d. Wissensch. Bd. liv. p. 336; Schultze's Archiv., Bd. iii. p. 88. See also Eb Untersuch. über die Leber der Wirbelthiere, Schultze's Archiv., Bd. iii. p. 423.

oss branches of communication, so that the whole assumes

of the structure to the original tubular type, when no longer
o conform to the general acinous plan on which the organ is
in the higher animals, will be seen to have an important
l bearing as indicating that the epithelial and gland cells are
omologous structures.

illary framework of the acini may be demonstrated in the
r by the method of His. (See Plate III., Figs. 1 and 2.) In ex-
e capillaries thus exposed, it is seen that in addition to their
e diameter as compared with capillaries elsewhere, they look as
e surrounded by a continuous sheathing of apparently homo-
mbrane irregularly scattered with round cells, the nuclei of
eadily stained by carmine. In the human liver the appear-
fectly similar. The researches of MacGillavry* have shown
heath belongs to the lymphatic system. He has found by
at in the liver, as in the brain, the capillaries are surrounded
channels which in fact are the beginnings of the absorbent
the gland. Following the capillaries towards the periphery
les, they enter the larger lymphatic channels, which stand
ts in a relation similar to that in which the pulmonary
stand to the bronchi. At the hilus and in the ligamentum-
uodenale they pass through a number of lymphatic glands,
doubt in close relation with the masses of adenoid tissue
I have already said, are to be found even in the healthy liver
al canals.

ds the general structural character of the changes which are
in the liver by the tuberculous infection, I have nothing to
former statements. They have been since described by Dr.
d by Dr. Fox, whose accounts agree in all essential respects
wn. The chief change, says Dr. Fox, "is the appearance
ue of a glistening, semi-transparent character, which occupies
tance of the organ to a variable extent. Sometimes it only occurs
specks of the size of a pin's head or a poppy seed; sometimes
arger masses; sometimes it runs in lines, mapping out the
ry distinctly; sometimes it is found in irregular masses in
here is no trace of liver structure visible to the naked eye;
onditions before described may be reversed, and remains of
looking liver tissue may be seen running in lines irregularly
the semi-transparent tissue."† The observations of Dr. A.
lthough short, are comprehensive and very clearly expressed.
from Dr. Fox and myself only in one particular, namely,
that although the new growth, as a rule, originates from the
lar spaces, distinct masses of it are sometimes found either
e intra-lobular veins or even in the substance of an acinus,
not continuous with the larger layers or masses by which the
e separated from each other.

eing, therefore, a complete concurrence of observation as to
al features of the process, we are in a position to proceed to

129.

the examination of the other questions which suggested themselves at the close of my last year's inquiry; as, for example,

1. From what normal structure does the cellular reticulum, which at first constitutes the whole of the new growth, originate?

2. What is the ultimate destiny of the diseased parts?

I propose to consider each of these in succession.

Relation of the new Growth to existing Structures.—In the liver, as in the lymphatic glands, different parts of the same organ are always found to be in different stages of alteration. Thus at an early period, as, for example, six weeks after infection, the only changes which can be discovered by the naked eye consist in general enlargement and unnatural paleness of the whole organ, with granulations, masses, or laminæ of transparent material scattered through its substance. But on minute examination, even of the most healthy parts of such a liver, important structural alterations are discovered, both in the acini themselves and in the inter-lobular tissue. In cross sections of the inter-lobular spaces, *e.g.*, sections made near the surface in planes parallel to that of the capsule, it is seen that the inter-lobular vessels and ducts, instead of being in immediate contact with the peripheral ends of the columns, are sheathed in adenoid reticulum. The meshes of this reticulum are in some parts so minute as to contain only single lymph corpuscles (Plate IV., Fig. 4,) while in others they are of various sizes. The larger spaces contain veins or arteries (lymphatics?) and ducts. The smaller enclose masses of lymphoid corpuscles, the position and relations of which may be correctly stated by saying that they and the fine reticulum by which they are held together, fill up all the space not occupied by the vascular structures above mentioned. In pencilled sections these masses are apt to be removed altogether, so that the network which occupies the portal canal appears much coarser than in its original condition. (See Plate VI. Fig. 3.) The portal veins and arteries are unaltered, but it is constantly observed that the ducts, and especially those that are in immediate relation with liver cells, are enlarged, and that their epithelium has lost its regularity of arrangement. From the examination of a great number of similar sections, I infer that in the inter-lobular spaces the disease begins as an overgrowth of the normal adenoid pulp of the portal canals. In the acini the first change observed is a remarkable one. It consists in dilatation of the radiating capillary blood channels and in the appearance of corpuscles in great number within these channels, many of which cannot be distinguished from the colourless corpuscles of the blood, while others differ from them both in size and appearance. They measure from $\frac{1}{4000}''$ to $\frac{1}{1200}''$; the larger are nucleated, the smaller might be described as themselves nuclei. (See Plate III., Fig. 4, and Plate VI., Fig. 4.) Here and there they collect in great numbers, so as to choke up the vessel in which they appear to be contained. They differ mainly in their variability of size from the corpuscles of the reticulum, which seldom exceed $\frac{1}{3000}''$ in diameter. These appearances clearly admit of two interpretations. It may be supposed, either that the bodies in question are in reality what they seem to be, or that they are corpuscles which have originated in the vascular sheath, and have grown into the capillaries. It is not possible to determine by direct observation which of these views is the true one.

As a strong ground for believing that the bodies in question are inside of the capillaries, it is to be borne in mind that the existence of large numbers of colourless corpuscles in the blood vessels leading from adventitious adenoid tissue, is a condition which has been already met with in our study of the omentum; and further, that in all probability the spleen during its first stage of morbid overgrowth delivers

portal circulation many more colourless blood corpuscles than ural condition. The large size of the corpuscles seems to me much against the one view as the other; for in this respect r as completely from the colourless corpuscles of the blood as se of the adenoid reticulum. Whatever may be the origin of lies, it is certain that their presence must conduce, with other be immediately mentioned, to obstruct the intra-lobular circu- or it is constantly observed that the vessels in which they are e either obliterated or plugged with blood discs.

ventual result of the morbid process is the conversion of the gan into a mass of semi-transparent aspect, which resembles both stence and structure a lymphatic gland in advanced fibrous ation. The steps which lead to this result are as follows :—We eady seen how all the tubular organs in the portal canals lie in rk of transparent intermediary substance continuous with that forms the adenoid reticulum, and that in an early stage of this network becomes coarser and more distinct. It is very to trace this structure into the acini, so long as their condition is d; but in preparations of the kind represented in Plate III., Fig. 1, h the intra-lobular vascular network is freed from the liver cells cilling, I have always found that bands or strings of hyaline ce bridge over the interspaces between the capillaries at dis- which evidently correspond to the width of the liver cells ; so that y own observation I am inclined to concur with those who believe organ is pervaded throughout by a framework of hyaline bands, has the same relation both to the capillaries and to the cellular ts of the organ as that which exists between the corresponding res in the lymphatic glands. Whatever conclusion we may it as to the presence of the so-called *tela conjunctiva* in the healthy there is no doubt that as soon as the tissue of a lobule becomes d by tuberculous disease, the existence of such a framework be- obvious ; and that the first change by which the encroachment of er-lobular new growth of the glandular tissue is indicated consists development of transparent bands or threads, in the interlacing of the capillaries and liver cells gradually become involved. The ement of these bands is such, that in proportion as they become r and stronger the affected tissue is converted into a fibrous looking ork, in the holes of which the original elements are imprisoned. s way the liver cells become broken up into masses which are ted from each other by septa of transparent material. Hence two s follow—on the one hand the capillaries collapse and lose them in the trabeculæ of the newly formed stroma, while on the other ver cells, which at first struggle for existence with adventitious ar elements in the loculi of the stroma, finally waste away, the us often remaining after the body of the cell has disappeared.

ultaneously with this change the terminal bile ducts become the f another and most remarkable alteration. In all specimens in which iseased process is far advanced, certain spots are to be observed in ections which are distinguished by their extreme transparency, not y from those parts in which the liver cells are still in situ, but from eneral mass of diseased tissue of which they form a part. The trans- cy of these spots is found to be due to the fact that the loculi, d of containing liver cells or the remains of their disintegration, ccupied by bile-duct epithelium. In comparing them with sections rmal bile ducts it is found that the form and measurement of the are identical, and that they differ in nothing excepting the irregular

size and contour of the loculi themselves, and the absence of any arrangement in their contents. The only other view which can be entertained of their nature is that they are liver cells which have lost their granular contents, retaining their nuclei; in favour of which it is to be noticed that loculi are often to be found which are partly filled with liver cells and partly with epithelial cells. (See Plate III., Fig. 3.)

The final stage of the process is easily described. All cellular elements disappear excepting a few scattered lymph corpuscles. What remains is a fibrous network in the arrangement of which that of the tissue which it has supplanted may still be traced. In other respects it resembles the corresponding structures which we have already studied in the spleen and lymphatic glands (Plate VI., Fig. 4). Thus it appears that the adventitious adenoid pulp of the liver is liable to a process of fibroid degeneration which corresponds in all its important features to that which affects the natural tissue in those organs of which it forms the essential constituent.

Additional Observations as to Tuberculosis of the Lungs.

In the lungs the lesions are so uniform in their character in all the animals I have examined that I have nothing to add to the general description given last year, and shall confine myself to those questions which were then left undecided, and to others which arise out of observations made since. These refer to the relations of the adventitious masses of adenoid pulp which were designated in my last report peribronchial granulations, with those which exist normally in the lung, as well as to the irongrey nodules.

Considering that these granulations occupy the same position and have the same structure as the normal ones, differing from them only in size, it is natural to conclude that the relation between diseased and healthy structure is the same in the lungs as we have already found it to be in the peritonæum. As to the significance of the semi-transparent nodules which have been so often compared to miliary tubercles, repeated observations have shown me that the structure represented in my fourth figure (see former Report) is uniformly met with in microscopical sections of these bodies; and that in fact the semi-transparent nodules are not so analogous to miliary tubercles as to blocks of lobular catarrhal pneumonia. They owe their transparency not to the structural elements of tubercle, but to cells identical in size and appearance with the natural alveolar cells of the lung. In order to understand the nature of the pathological process of which these nodules are the expression, the manifestations of disease must be studied separately in each element of the original tissue, *i.e.* in the alveolar cells, the alveolar and bronchial epithelium, the blood vessels and lymphatics.

The alveolar cells are nucleated bodies which are always to be found in the alveolar cavities of the healthy lung. Each probably consists of a solid envelope of transparent substance collected round a more refractive central part. They usually contain a good many granules of black pigment, which are embedded in the envelope along with other granules of different chemical constitution. When seen in the healthy injected lung they look as if they filled the spaces between the network of capillaries which covers the internal surface of each alveolus. This arrangement, although it is, I believe, quite accidental, has led to their being often described as epithelium, in consequence of which much confusion has been introduced into the subject. The true alveolar epithelium is very difficult to demonstrate. Its elements are much smaller than those

described, and correspond in structure and arrangement with the terminal bronchial tubes. The latter can be readily studied s recently prepared by v. Recklinghausen's method. In such he epithelium may either be examined *in situ*, or may be prepared separately. It consists of oval or oblong plates (Plate V., Fig. 4), which contains a spherical nucleus about half as wide as itself. pithelium nuclei are readily stained by neutral solution of carbronchial epithelium, when so stained resembles a collection of rpuscles, and when seen in double layer may be easily mistaken nulation, for which reason carmine staining is rather a hindrance lp in studying diseased lungs. On tracing this terminal epithethe lobule into which the bronchiole leads, it is seen to fade adually till it becomes imperceptible, the reason apparently at it is so exceedingly delicate that it is destroyed by any rdinary liquids used under the microscope. That the epitheelly does extend into the alveoli themselves without materially its form, has I think been satisfactorily demonstrated by zczewsky.*

alveolar walls of the healthy uninjected lung no structure can guished excepting the delicate elastic framework of fibres by ne septa are supported. But in the diseased parts these septa tened in a way which I described last year as analogous to the ng of the trabeculæ of the spleen and lymphatic glands by the ial growth of nucleated cells. That the irongrey nodules do not ntirely of alveolar cells may be readily proved by applying the of pencilling to microscopical sections made parallel to the sur- By this means all the alveolar cells may be worked out, while the cells are retained in their place by the connective substance of um in which they originate and are embedded.

imals killed at an early stage of tuberculosis, that is to say, our weeks after inoculation with tuberculous matter, no change ved excepting that the peribronchial adenoid pulp is increased, other words, that true miliary granulations are formed in the ourhood of the terminal bronchioles. This fact appears to afford y to the mode in which the irongrey nodules are produced. er the choking up of the air cells is a merely mechanical result of umulation of adventitious matter around the bronchioles or of a al process, there can, I think, be little doubt that the granulation to the block of lobular pneumonia in the relation of cause to effect, at when a kernel of adenoid pulp occupies the centre of a nodule t signifies that the nodule originated from it.

have, lastly, to consider the relation of the process to the absoressels. It has been long known that the lymphatics of the lungs e divided into a superficial and a deep system of vessels. In the he superficial lymphatics spread over the whole surface of the in the form of a network, the vessels following the divisions en the lobules. From this network the lymph finds its way, by s which sink into the depth of the lung along with veins, and then pany the bronchial tubes to their origin. In this course the atics form more or less perfect sheaths around the blood s and bronchi. When the lymphatics of the lung are injected

ywodzoff, Die Lymphwege der Lunge, Wiener Med. Jahrbücher, Bd. xi. p. 1,

in the dog the mass may be traced even into the septa of the alveo... From the alveoli the lymphatic channels converge so as to form larg... vessels, which commence in the immediate neighbourhood of the bro... chioles and terminal arterioles. At these points of confluence, say Wywodzoff, collections of lymph corpuscles are always to be found which he supposes to be contained within the lymphatic cavity. Ho... ever this may be, the fact is of great interest as showing the close rel... tion between these masses and the absorbents. The observations Wywodzoff relate entirely to the pulmonary lymphatic system ... the dog. It has been shown by Afonassiew,* that if carmine is injec... into the pleura of the living guinea-pig, the liquid finds its way into t... deep lymphatics which accompany and surround the lymphatic tu... the course of which is indicated by the staining of the tissue; so t... there is every reason to believe that the superficial system of absorb... communicates with the deep system in the same way in the rod... as in the dog.

Conclusions.

1. The characteristic product of tuberculosis is not an aggreg... of shrivelled particles of irregular form, but a tissue compos... lymph corpuscles held together by a network of hyaline conne... substance.

2. There is a close structural analogy between this tissue and t... certain follicular organs belonging to the lymphatic system, *e.g.* follicles of Peyer, the ampullæ of the lymphatic glands, &c.

3. All the favourite seats of tubercle are naturally characterize... the presence of this tissue, which, from the analogy stated above, ... properly be called *adenoid*.†

4. The natural distribution of adenoid tissue in the body is in intim... relation with the lymphatic system. In the great serous membranes (w... v. Recklinghausen's discoveries have taught us to regard as wall... lymphatic reservoirs) it forms sheaths round the blood-vessels, or ma... of microscopical dimensions and irregular contour underneath ... epithelium. In the solid viscera it is distributed here and there in ... course of the lymphatic channels.

5. In the peritonæum, tuberculosis primarily consists in the enla... ment or overgrowth of these sheaths or microscopical masses of ade... tissue, and consequently the tuberculous nodules which are fou... have the same intimate structure, and stand in the same anatom... relation to the vessels and epithelium. In the viscera the essen... lesions also consist, not in new growth, but in overgrowth of pre-exis... masses of adenoid tissue.

6. The primary local lesion in artificial tuberculosis, whether the c... be simple wound or specific inoculation, consists in the development at ... seat of injury of granulations or nodules which have similar struct... characters with those of adenoid tissue elsewhere, but cannot as yet ... shown to be in relation with the absorbent vessels.

† The term adenoid has been introduced into pathological nomenclature ... entirely different sense. It has been applied to tumours which consist essentia... overgrowth of elements belonging not to adenoid, but to acinous glands, *e.g.*, ... epithelium of the liver and breast respectively.

first step in the dissemination of tubercle, consists in its being primarily by the lymphatics (which convey it to the lymphatic which they are tributaries), and secondarily by the veins. nus entered the systemic circulation, it is distributed universally teries. The serous membranes seem, however, by preference riate it, and from them it extends by contiguity to the super- s of the organs which they cover.

final stage of the process consists in the tertiary infection of s of each diseased organ, which glands consequently undergo ent and induration, and eventually become partially caseous. rgement is due to the multiplication of cells in all the tissues gan, but more particularly in the alveoli—the hardening to a of fibrous degeneration—while the caseation consists in slow of the previously hardened and anæmic parts. From the first l is incapable of performing its functions, but it is not until on commences that the absorbents of the organ to which it are completely obstructed.

the liver of the guinea-pig, and in some other organs, tuberculous ndergoes a fibroid degeneration and caseation, the results of unnot be distinguished from those observed in the normal adenoid the lymphatic glands and of the spleen.

s regards the question of a specific contagium of tubercle, we very important to note that this is not as yet disproved by the traumatic tuberculosis. It still remains open to inquiry whether injuries which are of such a nature that air is completely d from contact with the injured part are capable of originating ulous process. The results of the following experiments under- at the instance of Mr. Simon, with special reference to this , seem indeed to suggest that they may not be so. Setons in carbolic acid were inserted in 10 guinea-pigs on the 24th of ber 1868, each animal receiving two. At the same time extensive s of both scapulæ were produced on five others, care being taken njure the integuments. No tuberculosis or other disease of inter- ans resulted in either case. These facts certainly point to the y of further investigation in this direction.

(From a liver in advanced fibroid degeneration in ich the hepatic artery has been injected.)—The reticulum is trans- med into a sponge-like tissue in which laminæ take the place of ments. Lymph corpuscles, many of which are nucleated occupy ne of the loculi. Magnified 460 diam.

Fig. 7. Lymph corpuscles from blood of portal vein of guinea-pig, . 56, (2d series). Magnified 460 diam.

Explanation of Plate V.

Fig 1. Nodular tubercular overgrowth of adenoid vascular sheath from the omentum of a tuberculized guinea-pig, killed four months after inoculation. The abdominal organs have been injected with Beale's blue, by the cœliac axis. The preparation demonstrates the extreme vascularity of tuberculous new growth. The capillaries of new adenoid tissue being of great delicacy, they cannot be made out without injection. In the present instance the injection had passed into the veins, many of which were slightly coloured. Magnified 460 diam.

Fig. 2. Section of a pulmonary lobe of a healthy guinea-pig procured for the purpose of demonstrating that adenoid tissue, indistinguishable from that which constitutes tubercular granulations, exists in the normal lung. The section has been made so as to cut across the principal artery and bronchus of the lobe. *a*, artery ; *b*, bronchus—the brownish red bodies being imperfect cartilaginous rings ; *c*, mass of adenoid tissue surrounded by a layer of black pigment. This mass is cylindrical, the axis of the cylinder being parallel to that of the bronchus and artery, to which structures its relative position is always as represented ; *d*, alveolar tissue ; *e*, loose connective tissue surrounding the artery and bronchus. Magnified 60 diam.

Fig. 3. Apparently healthy lung of guinea-pig, No. 94, (2d series) inoculated three weeks previously by introducing tuberculous material into the peritonæum. The lung was first injected with Prussian blue by the pulmonary artery, and then filled to distension with warm solution of gelatine. In fresh sections stained with carmine of the lung solidified in this way, microscopical collections of lymph corpuscles (*a*) could be discovered here and there, all of which were in close proximity to small arteries or bronchioles. In the drawing a "granulation" of this kind is seen lying behind a minute arterial trunk which the knife has happened to truncate immediately in front of the centre of the little mass. Its rounded form is evidently due to its having grown into an alveolar cavity, the capillaries of which may be traced over it. The rich capillary network (*b*) which surrounds it belongs to other adjoining alveoli. Magnified 200 diam.

Fig. 4. Shred of epithelium from an infundibulum, stained with nitrate of silver. This epithelium does not cease abruptly where the internal surface of the infundibulum becomes continuous with that of the alveoli, but gradually loses its distinctness. I have failed in my endeavours to demonstrate an epithelial layer in the alveoli, but do not doubt its existence. Magnified 650 diam.

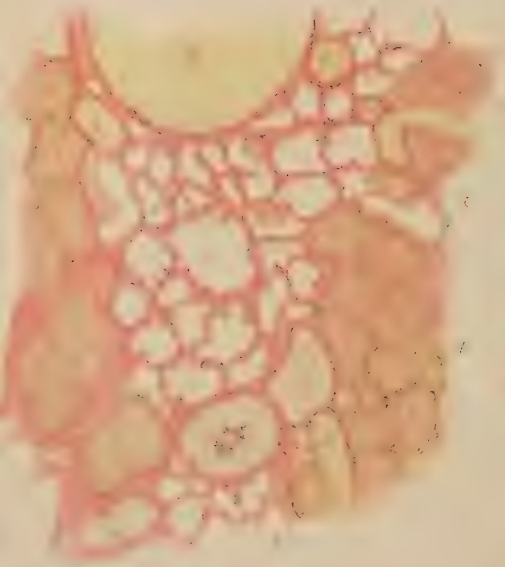

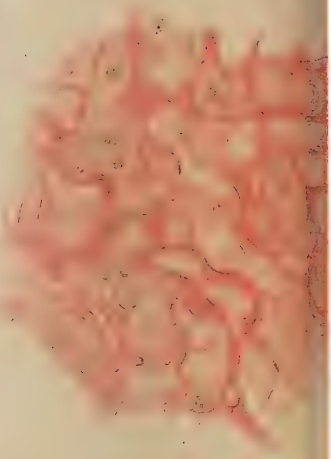

Fig 4

Explanation of Plate VI.

·. 1. Section of liver of guinea-pig, No. 56, (2d series), inoculated
·ks before death with transparent material from the supra renal
le of a patient who had died on the previous day of Addison's
:e. The section is vertical to the surface of the organ. *a.a.a.*
.obular bile ducts lined with epithelium. *b.b.* Ends of the con-
ng columns of liver cells of which an acinus is formed. *c.* Reti-
ı from the meshes of which the corpuscles originally occupying
have been removed by pencilling. From the obliquity of the
of section in relation to the interlobular septum, some parts of it
ır fibrous, others alveolar. Magnified 460 times.

ɾ. 2. Epithelium of the double layer of peritonæum which encloses
xtremity of the pancreas of the guinea-pig ; the drawing is intended
ıow the structure of this membrane, in relation to the frequency
which it becomes the seat of tubercular granulation. *a.* Nuclei of
pithelium, some belonging to the layer nearest the observer others
: layer opposed to it. The reticulated wavy lines represent the
stitial cement by which the contiguous elements (scales) are
d to each other. Those which intersect each other belong to
ent layers. The epithelium where it covers the vein (*v.v.*) is
fied in form, the scales being oval or oblong. *b.* Apertures in the
brane at the edges of which the two layers of epithelium are con-
us with each other. Everywhere else the space between the two
s is occupied either by vessels or by a meshwork of extremely
ne connective tissue fibres, which are continuous with the similar
: which forms the sheaths of the blood-vessels. This tissue is of
tenuity that even in preparations stained with carmine, it is not
guishable, unless the epithelium has been removed by previous
ration. The lymphoid corpuscles which exist in such numbers in
n parts of the same membrane are embedded and originate in this
ture.

ɾ. 3. Section of liver of guinea-pig inoculated four months pre-
ly by Dr. Fox with human tubercle. The section is parallel and
o the surface of the organ. *a.* Portal vein and tributaries thereto.
ction of an interlobular duct. *c.* Reticulum occupying the greater
f the portal canal. *d.* Cavity containing remains of epithelium.
fig. 1, the cells which originally filled the holes of the reticulum
been removed by pencilling. Some have contained adenoid pulp,
s liver cells (*e.*) Magnified 460 times.

ɾ. 4. Pencilled section of acinous tissue of liver in advanced fibroid
eration. The reticulum is so abundant, that it seems to constitute
hole substance of the organ. The liver cells as well as the adenoid
have entirely disappeared ; of the cellular forms that remain some
bly are epithelial nuclei, others which appear to be contained in
lar cavities, are I believe of the same nature as the corpuscles met
n the earlier stages of the process in the capillaries. Magnified
mes.

A.—*Notes on the Febrile and some other Morbid Processes with reference to their Chemical Investigation.*

Phenomena of the febrile condition.

The febrile condition is constantly associated with the follow abnormal phenomena :—(*a.*) Increased temperature of the body. (Increased disintegration of albuminous substances. (*c.*) Diminish muscular power. (*d.*) Diminished ingestion of nutriment. (*e.*) Diminish urinary water (*f.*) Diminished powers of the senses and of sensorium. These changes are common to all febrile states, no mat what may be their specific origin. I proceed to consider the two f conditions only, with the assistance of such chemical information a has hitherto been possible to gather.

Temperatures in disease.

44, nerve affections.

43·37 in dying.

41·87, agony.

41·75, or death line.

41·62.

41·25 as morning T. always fatal.

50 per cent. line.

Temperatures up to C. 44° occur in certain spinal injuries and acute tetanus. Next in order are temperatures which occur only dur the process of dying, 43·37° being the absolute maximum of T. (T. temperature) in fatal cases of typhus. At 41·87 begins the agony death. The line 41·75 is momentous, because hitherto no patient w typhus, whose T. has risen above that line, has been known to reco I have therefore termed this line the death-line. Patients with shiv ing fits in the morning may rise to 41·62 and not necessarily die ; when typhus patients reach the temperature of 41·25 in the morni they always die. The line at 41·12 may be termed the 50 per ce death-line, because one half of all patients going above this line From 41° to 40·37 range the average maxima of favourable cases, a from 40°·6 to 40° the average maxima of morning temperatures of same class of cases, more particularly of typhus fever. At 38·6

ne to the maximum of health, at 37·6 to the mean, at 36·76 to the inimum of health. At 36·5 we find certain cases of autumnal diarrhœa, ulating typhus and typhoid fever. This is also the death-line of lera. All cases whose temperature ranges persistently below this have, as far as the observations of the epidemic of 1866 went, died. e range of the minima of cholera cases is between 36·4 and 33·9, and lowest T. observed in any case of cholera is 32·9. See tables in 9th port, particularly Table 40.)

Morning T. of favourable cases.

36·5 is the minimum dead line of cholera.

Lowest T. observed in cholera.

In febrile and other diseases where there is no obstruction to any very at part of the circulation, the most accurate measurements are most ekly obtained in the cavities, rectum and vagina; but the same ults are obtained in the axilla, if the thermometer be allowed to main there until stationary. In some conditions, however, namely in lapse of acute cholera and in the agony of death, the temperatures the cavities are above the temperatures of the axilla :—*i.e.*, the heat oduced in the deeper tissues accumulates in them, not being carried ay again by flowing blood, but having to find its way slowly through lly conducting materials. For the same reason the temperature of a ly which has just died sometimes rises by several tenths or even an tire degree for some minutes, until the chemical effect of the stored ygen is exhausted ; when, with the venous condition of the capillary ood, the local death of the tissues takes place.

Difference of T. in axilla and internal cavities.

T. rises immediately after death.

The sensation of cold in the shivering fits of high fever is a decep- n of the peripheral sense of temperature, produced by the con- ction of the small blood vessels of the skin, and the contractile sues of that organ in general. From the moment that this asmodic effect ceases the fever patients have the sensation of exces- e heat. Their sense of temperature is constantly excited until in irium they fancy themselves on fire. One of the effects of this condi- n is that the heart makes increased efforts to circulate blood so as to tain a compensating reduction of the temperature by increased evapora- n from the lungs and skin. The number of the beats of the heart are vays greatly increased in fever ; and with this increased labour the art tends to become exhausted. A kind of artificial fever can be pro- ced by the Turkish bath, especially with its higher temperatures. First ere is sweating, then the pulse becomes rapid, and with arterial murmurs l a pulse of 140° per minute, and a rise of the temperature of the ly by one or two degrees as measured in the cavities, begins a state unconsciousness or anæsthesia, which differs entirely from syncope, th which it has been confounded, and is similar to the unconscious nditions of typhus and typhoid and other febrile patients. During s process of the production of anæsthesia by heat the powers of the scular system are constantly decreasing, until a degree of debility ual to that of the acme of typhus is reached. Very evident in ulthy persons, this effect is still more striking in persons suffering in some sorts of paralysis, with but a small amount of contractility in ir muscular system left.

Nature of shivering fit.

Artificial fever by Turkish bath.

Increased disintegration of albuminous substance is the second in effect of the febrile process. Its existence and amount are ascer- ned by comparative analysis of the urine. It is not maintained t the non-nitrogenous matters contained in and introduced into the ly during fever are not also disintegrated more rapidly. On the ntrary, this is very probably the case with all, such as fat, starch, and gar, and certainly the case with alcohol, as I have shown in the special pter relating to that body. See last Report, p. 282. It is also certain t the quantity of non-albuminous matters disintegrated or oxydised luences the quantity of albuminous matters oxydised in the same

Increased disintegration of albuminous matters.

Apparatus for collecting excretions.

time, by diminishing it; that heat, febrile or normal, may be produ by the oxydation of either, but is produced if possible first from n nitrogenous matters, and if these are absent or insufficient, then fi nitrogenous matters.

In order to the accurate measurement of these effects of the feb process the food and excretions have carefully to be ascertained analysed; and among excretions I of course include the products respiration. The urine has to be collected separately and complet as yielding one of the main and most important indications. In reg of persons who are not bedridden this is best done by means of spe apparatus such as I described in 1864, in the Journal of the Society Arts. And besides food and excreta, the body-weight of the patient

Respiration apparatus.

to be taken into consideration during the whole of the disease. All th desiderata can only be observed by the aid of particular arrangeme in hospitals, and by the aid of the large and expensive apparatus f constructed at Munich by Pettenkofer and Voit. Where these facili do not exist the research has to be limited to the determination of disintegration of the albuminous substances. This has hitherto mai been effected by the quantitative determination of the excreted urea

Liebig's, Davy's, and other analyses for urea.

means of Liebig's volumetrical analysis. Now although this gives main bulk of the products of disintegration, it does not indicate whole by several per cent. Some inquirers have therefore determi the excreted nitrogen as such, by means of particular processes (Da Neubauer). But my researches on uromelanine, omicholine, omich acid, have shown that chlorine, which was relied upon as a decompos agent in the analyses of Davy and others, does not decompose the produ

Chlorine does not liberate nitrogen of uromelanine.

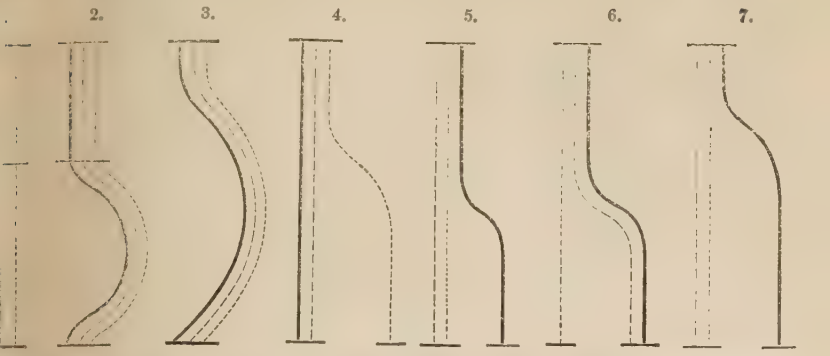
just mentioned in such a manner as to liberate their nitrogen, and t in short nothing but actual combustion with soda lime will set all nitrogen of urine free in the form of ammonia. Liebig's analysis con however, closer up to the actual amount than the chlorine proc because urochrome is precipitated by the nitrate of protoxyde mercury. As this amount of a compound, the nature of which is present only partly known, enters the account as tetra mercuric-ur nitrate, it introduces a source of inaccuracy for the elimination of wh the future will have to provide. A similar remark holds good w regard to creatinine, uric and hippuric acid. But these it is possible determine, although by difficult or circumstantial methods only. T indications of the quantity of urea or nitrogen in the urine are of cou the more important the more of it is derived from tissue juice and from daily food; for this proportion assigns the degree in which we one of the most common results of fever, namely emaciation.

Urine in acute fevers not qualitatively changed.

Generally speaking, the febrile process as exhibited in the urine i quantitative change without final qualitative alteration. At least, so as present information reaches, the ingredients of febrile urine do differ qualitatively from those of healthy urine, but are present, some increased, others like chlorides, in diminished quantities. The quali tive change which takes place in the febrile body occurs intermediat between albumen and urea; and to the rule that all anomalous produ of albumen become again urea, only one disease, malignant jaundice at present known to form a complete exception; and even here the ception is only complete in the most extreme cases. The products diseased action are destroyed in the blood like the pabulum of health

It is interesting to compare with our ordinary acute fevers a num of other diseases which vary the bearing of the constituents of food blood. Such a comparison, according to my conception of the m features, is represented in the following diagrams; where the continu lines indicate the course of the albuminous substances, the interrup

: that of the fatty, and the dotted lines that of the saccharine ients of assimilated food.



Explanation of diagrams.

)iagram 1 is that of health. The three factors run through the ıry function, indicated by a horizontal line at a place about $\frac{2}{5}$ths from top of the diagram. Diagram 2 is that of typhus fever. The three ors run through the biliary function, but deviate greatly from the nal afterwards; their products, however, return to normal qualities, urea, urochrome, carbonic acid, and water, &c. The third diagram trates what is believed to be the course of more virulent fevers, such ellow fever. All factors deviate immediately, the biliary function is performed, and death occurs at the height of deviation, or the func- s return to normal channels. Diagram 4 illustrates the course of etes. The amylon and sugar line alone deviates, and that to the end, e both albuminous and fatty matters follow the course of health. In ram 5, that of cystine disease, the albuminous matters alone deviate, e fats and sugars retain their ordinary course. In diagram 6, that of ous urine, sugar and starch follow the lines of health, while fats albumen are at least in part diverted. The 7th diagram exhibits the se of malignant jaundice, in which albumen only is diverted, sugar fat following the line of health. The disease, therefore, in these t features resembles cystine disease, but differs by the deviation of albumen taking place before the biliary lysis has been effected upon hile in cystine disease there is no interruption, but only a partial itative change of the biliary lysis, cystine being produced instead r as well as taurine. In malignant jaundice all biliary lysis ceases at ven period, and no taurine is formed. What has here become of the huretted part of albumen, which should have formed taurine (and ch in the other diathesis forms cystine) is not known.

nder all circumstances the greater part of the products of diseased on is destroyed in the blood like the pabulum of health, and turned ammonia, carbonic acid, and water, or their equivalents. Only in eme conditions, such as diabetes, or malignant jaundice, the process onversion indicated by one line or the other is entirely perverted, the products of the processes indicated by that line are entirely ormal. Thus in slight degrees or incipient stages of malignant dice there is as yet neither tyroine nor leucine, but the ordinary ary products. In higher degrees tyroine and leucine appear by the of urea, and in the ultimate fatal stages leucine and tyroine, with r abnormal products, assume the place of urea, which disappears rely from the secretion.

Relation of urea to temperature.

In febrile diseases such as are indicated by diagrams 2 and 3, there a certain relation of urea to temperature observed. But the explanati of this relation meets with difficulties, as several sources of error a found during its consideration. Thus it is impossible to say what w the amount of either food or tissue consumed, and consequently wh kind of waste, blood or tissue waste, the urea formed represents. Ne it is impossible to tell the nature of the decomposition preceding t formation of urea, and consequently to calculate the number of units heat evolved. And even if these were ascertained it would be pra tically impossible to determine the heat absorbed by the evaporati from skin and lungs, on the one, and that which has to be got rid of radiation on the other, hand. The error arising from the excretion a little urea by the skin is so small that it can be neglected.

Generally speaking, it may be affirmed (*a*) that in all diseases wi raised temperature urea is increased ; (*b.*) that the process which pr duces urea produces the fever ; and (*c.*) that the quantitative aberrati is preceded by a qualitative one, as shown in the diagrams. But th three conclusions can by no means be reversed, nor are they absolu though general, because (*d.*) urea may be increased (to double t normal standard) while temperature is lowered. This is the case in di betes. Diminished heat and diminished excretion of carbonic acid here hand in hand. (*e.*) Urea may be diminished in acute fever, if oth products are discharged instead, the decomposition-heats of which a the cause of the increased temperature observed. (Leucine, tyroi changed hematine.) (*f.*) These decompositions precede the urea form by the abnormal process, and their heats are therefore superadded to t heats, which possibly may be, but are not necessarily produced by t ultimate urea formation.

In diabetes urea increases, T. is lower, carbonic acid lessened.

Chronic diseases.

There are chronic diseases which in such respects as are here und consideration show features similar to acute. It is as if certain materi slowly accumulated in certain parts of the body, and presently split into secondary products of diseased decomposition ; this splitting evolving heat—the same as that which was absorbed or became lat during the synthesis in which the compound was made, in the plant animal ; and the secondary products getting oxydised with furth evolution of heat, till no diseased products ultimately remain. Su processes seem to be illustrated in the several stages of gout.

Nature of the specific changes.

Of the nature of the specific changes but little is known, and mu remains to be ascertained. This is indeed the most difficult task chemico-pathological inquiry. Some changes are primary, and conce matters which are yet in the intestinal canal, or already in the blo Others are secondary or results of fever. Many brain-diseases attend by delirium, and also tetanus, are accompanied with decomposition of t sheath of the nerve-fibre, which, as shown by the reaction with perosi acid, consists of cerebric acid ; and no doubt this decomposition may produced either by external heat radiated upon the part (as in sun-stro or by fever-heat operating through the blood. In acute softening of brain this decomposition advances so far that glycero-phosphoric acid constant product of the decomposition of cerebric acid, is met with in fluid which surrounds the softened part.

Glycero-phosphoric acid in softened brain matter.

Cases of diminished temperature.

It may be useful to draw attention to the causes and effects of di nished temperature, in order by the contrast to aid in the explanat of those of increased heat. The most direct and immediate cause sinking of the animal heat is failure of the heart's action, as in a faint fit. This, sudden and severe, may be caused by terror, or in weake constitutions even by slight impressions on the mind. A slower but s direct cause of the same effect is external cold. It acts physically by p

ing spasm. During immersion in very cold water (such as that which es from an alpine glacier with a temperature of 8° C.) the pulse ppears, the limbs shrink, muscular spasms appear in various parts of body, and the heart gives indications of a tendency to arrest its action. en elements for the production of heat are abstracted from the body in starvation, bleeding, and diarrhœa) the same result occurs. And so forms part of the state of collapse which many poisons (common morbid) produce. Partial paralysis acts by loss of motion only, but plete paralysis, such as paraplegia, *e.g.*, by severing of the spinal row, causes at first a great rise in the temperature. Sections of one of the spinal marrow produce paralysis of motion with diminished t on the one, and increased heat and hyperæsthesia on the other side.

During the impairment of chemical action in diminished temperature, ters collect which afterwards when they become oxydised (with or hout accidental assistance from exterior circumstances) cause an in- Chemical definition of
ise of temperature, or so-called reaction. But abnormal matters may "reaction."
collect by being produced quicker than they can be oxydised, and

nderstand to be the point at which more morbid material is beginning
be oxydised than is produced in equal times.

I have not been able to convince myself of the existence of critical Critical days
s, as defined by Traube, namely, the uneven days from the beginning doubtful.
the disease. Though there might be clinical appearances, the
mical phenomena did not keep parallel to them. The circumstance
t in intermittent fever reaction and crisis are indefinitely repeated in Crisis in inter-
finite intervals, points to a limitation of the length of time during mittent fever.
ich abnormal matters may collect. In remittent fever the intervals
in closer approximation and observe no regular periodicity. In
hus and yellow fever, crisis and reaction are compressed within a Crisis in typhus
y short span of time, and may be possibly imperceptible unless and yellow
asurements and analyses are made at such short intervals as two fever.
rs.

In chronic diseases, on the other hand, crisis and reaction occur at Crisis in chronic
y long intervals. Thus in chronic intermittens, I have observed diseases.
m every 28 days in the male subject. Gout, again, may show them at
rvals of weeks, months, or years. However intervals may vary, the
cess shows the same course and derivation.

Carbon leaves the body in breath and urine. In the breath it occurs Collateral
carbonic acid and as carburetted hydrogen. The latter in health features of the
pears in small quantity, but may perhaps be increased in diseases. chemistry of
e symptomatology of the tongue may be enriched by observations on fever.
s point. For abnormal gases during expiration may exercise an Abnormal
uence upon the tongue as well as morbid kinds of saliva and buccal gases.
retions. The origin of the carburetted hydrogen gas is mostly in
intestinal canal. As marsh-gas, $\mathrm{C}H_4$, it is a regular constituent of Marsh-gas in
us, and of those great and painful collections of gas which produce tympanites of
tympanites of abdominal typhus. Possibly carbonic acid gas may typhus.
secreted from the blood into the intestine when the lungs fail in
ion. Thus in hydrothorax I have repeatedly observed tympanites and
tinued eructation of gas. These considerations derive great support
m the conception of respiration as being primarily an act of secretion,
fore it becomes one of absorption as well. But the fact has to be borne
mind, that most of the gas which occurs in the intestinal canal is the
duct of the decomposition of its contents.

A measure of disintegration of blood-corpuscles wanted.

The significance of the various nitrogenous bodies in the form which nitrogen leaves the body during fever, and their relation to ea other, can only be found by continued quantitative researches. Wh we know of urea almost suffices for a theory in which all factors are harmony. But we must have a measure of the disintegration of t blood, and that we can only find in uromelanine, or better still in method of determining urochrome with the same despatch as urea. Wi such a measure we could ascertain the quantitative effects of fever better than with the thermometer or urea analysis alone. The th mometer gives us a measure of the aggregate chemical changes; t urea a measure of the disintegration of albumen; but urochrome wo show us the amount of disintegration of the corpuscular respiring a oxydising part of the blood. Much of the efforts of pathologists mu therefore be directed upon obtaining this aid; and consequently m researches of the last two years have lain very particularly in th direction.

B.—*Waxy Degeneration, particularly of the Liver.*

Bacony liver, &c., discovered by Rokitansky.

Waxy degeneration affecting most organs of the body was first scribed by Rokitansky. He termed it bacony degeneration (Speck-leb on account of the peculiar consistence which organs, *e.g.*, the liv assume under its influence. He observed peculiar corpuscles from size of granules to that of larger animal cells, some of the larger ones which showed concentric rings. On account of their peculiar cons tence, and their tendency to break up under slight pressure like drops cold jelly, he termed them *colloid* corpuscles. He thus applied t

Difference between colloid degeneration and colloid tumors.

microscopic formation, the result of the morbid metamorphosis o natural tissue, an adjective which Laennec had applied to a pecul kind of tumor, a new growth. Some of the peculiar corpuscles exhil ing a concentrically stratified appearance, Rokitansky following P kinje, termed (first variety) amylaceous bodies, others (the sec variety) he termed *stratified colloid* corpuscles. (Pathol. Anatom. 116.) Virchow examining these corpuscles by means of iodine, obser that they assumed colorations varying from pale blue to blue gr violet, and brownish, but never purely violet or blue; on subsequ addition of sulphuric acid they assumed a blue, violet, or violet bro

Amyloid corpuscles.

colour. This induced him to term the bodies *amyloid* corpuscles, to attribute to them the properties of cellulose. (Virchow's Arch 6, 135; 6, 268; 6, 416; 8, 140; 8, 364.) Busk assented to t because he saw that the corpuscles became blue by the influence chloride of zinc-iodine (Quarterly Journal of Microscopic Science, 18 January). It was, however, often observed that organs which had general characters of this degeneration with iodine and sulphuric a gave only a mahogany coloration, and no blue whatever. (See I Bristowe and Ord, in Path. Trans. Vol. X.) And an analysis of extract by potash from a bacony liver, made by Kekulé, had yiel data which showed the extract to possess the composition of an al minous body. It became, therefore, necessary to establish a distinc

Distinction between waxy and amyloid degeneration.

between the bacony, or as it is now termed waxy, and the amyloid generation, and to examine the chemical differences between the processes.

An exquisite specimen of a waxy liver from a patient who had b under the care of Mr. Simon was therefore subjected to the follow examination. A part of the liver was ground to a pulp, extracted v cold water and filtered. The solution with a little acetic acid, or itself on boiling, as also with nitric acid, and subnitrite of mer

llon's reagent), gave the reaction of albumen. Evaporated, the lue extracted with alcohol, after evaporation of the alcohol a tion was obtained which gave no reaction with Trommer's test. sequently sugar was not present in the extract.

Cold water extract contains albumen, no sugar.

nother part of the liver was repeatedly extracted with boiling water, the extracts were united and evaporated to a syrupy consistence. enkofer's test gave no reaction, so that bile-acids were absent. No ır could be detected either in the residue or its evaporated alcoholic xact.

Hot water extract contains no bile-acids, no sugar.

he pulp, which had been extracted with hot water, was boiled with hol, and the decoction filtered hot. The filtrate was evaporated to ness and redissolved in a small quantity of boiling absolute alcohol. cooling of this solution a considerable quantity of cholesterine was osited. The crystals were mixed with drops of fat. The filtrate n this deposit was again tested for biliary acids, but none were d. With nitric acid a feeble reaction of green, blue, and violet was ined. As the alcohol reacted rather violently with the acid, the tion was diluted with twice its bulk of water, whereby a milky cipitate ensued. This was completely soluble in much acetic acid ty acids). When to the turbid solution chloride of iron was added ark yellow precipitate ensued, which may have been benzoate or cinate of iron.

Alcohol extract. Contains cholesterine, no bile-acids, little cholophæine.

A part of the liver was comminuted and heated with hydrochloric l. The dark purple solution was filtered, heated on the water bath, treated with small quantities of chlorate of potash, until the fluid sed to froth and was clear yellow. On the top there was some fat, the bottom of the fluid there was a small quantity of a yellow flaky cipitate. This was easily soluble in alcohol. It follows from this t gelatine is absent, and that the main bulk of the matter behaves e syntonine.

Fatty acids.

Benzoic or succinic acid.

No gelatine, but syntonine.

No part of the liver, fresh or extracted with alcohol, gave with iodine, iodine and sulphuric acid, any reaction indicating the presence of loid or cellulose matters. The particles only assumed a mahogany wn colour.

No amyloid reaction.

Results.—The waxy liver contained of abnormal substances syne, cholesterine, and benzoic or succinic acid. Biliary acids and ar were (abnormally) absent; a trace of cholophæine was present. ly very little fat was met with. Consequently the degeneration sists mainly in the displacement of gelatiniform tissue, and the ppearance of sugar and biliary acids, with the abnormal deposition syntonine (or a matter behaving like syntonine) and cholesterine.

Results.

—*Determination of the Quantity of Sugar circulating in the Blood in a case of Diabetes.*

t has been affirmed that the proximate cause of the symptoms of dia- es is melitæmia. And undoubtedly sugar has been found abun- tly in blood examined in the usual way after withdrawal from veins. t it was not quite certain that all this sugar, or any of it, existed in blood while circulating, and that there had not been a post-mortem rather a post-venesectionem change of some glycogenous material o sugar. Moved by these considerations Mr. Simon suggested the owing experiment, which was accordingly carried out at St. Thomas's spital. 69 grammes of blood were withdrawn by venesection from arm of a female diabetic patient. Of these 29 grammes were received ectly into 75 grammes of absolute alcohol yielding 104 parts of mix-

Question.

Experiment.

ture. This after two filtrations was by nitric acid and boiling fou
free from albumen. It was now examined with a saccharometer, to
more fully described in the following. In this apparatus a diabe
sugar solution of 4·75 °/₀ compensated (a) 0·72 ; (b) 0·71 ; (c) 0·
= mean 0·71 inches of scale adjusted to left turning oil of turpenti
The blood extract compensated 0·01 inch, equal to $\frac{4.75}{71.6} = 0.067$ °/
sugar in mixture. Multiplying this by $\frac{104}{29} = 3.58$ we get 0·2398 °/
sugar in blood. Taking the whole of the patient's blood at 4,500 cu
centimetres, it would after that rate contain 10·8 grammes of sug
The second portion of blood, measuring 40 cubic centimetres, which h
been drawn with the above, but not into alcohol, was after 24 h
standing treated in exactly the same manner as blood 1. Blood 40 gm
alcohol 103 gms., mixture 143 gms. In the saccharometer the filte
mixture compensated exactly 0·01 inch of left-turning turpentine. Co
sequently this second blood contained neither more nor less sugar th
the first. The alcoholic extracts, after evaporation of the alcohol a
resolution of the residue in water, gave the test for sugar with alkali
copper solution.

Result.

Jellett's polarimeter.

Jellett's Polariscope.—The foregoing observations were made wit
polarimeter which was invented a few years ago by Mr. J. H. Jelle
Professor of Natural Philosophy in the University of Dublin. As t
instrument is by far the most accurate polarimeter extant, but is nev
theless little known and less used, I think it almost a duty to give
short description of it in this place, accompanied with such illustrati
as will make its construction readily understood. The description w
closely follow the inventor's account, as given in vol. vii. of the Proce
ings of the Royal Irish Academy. The instrument represented in
woodcut, and which was employed in the foregoing analyses, is by M
Spencer, philosophical instrument maker, of Dublin.

Drawbacks of ordinary Nicol's prism.

In determining the plane of polarization of a ray by means of
ordinary Nicol's prism, the observer is required to arrest the rotation
the prism at the point at which the intensity of the transmitted light
at a minimum. But it is difficult to do this with very great accura
inasmuch as the observer is obliged to compare a shade of colour
with any other shade which is before his eyes at the same instant,
with his recollection of a shade observed at the previous instant.
insure any tolerable degree of accuracy the observation must be ma
very rapidly, so that the eye may receive the new impression while
former one is still quite fresh in the memory. The difficulty of do
this with accuracy in any case is obvious, but it is most felt in expe
menting on light reflected or transmitted by fluids. For here it is
possible to touch the instrument without producing a tremulous mot
in the fluid, and therefore in the image reflected or transmitted;
this motion while it lasts renders accurate observation very diffic
But if the rotation of the analysing prism be stopped for a suffici
length of time to allow this motion to cease, the recollection of the
viously existing tint will no longer be so fresh as to allow the compari
to be made with any very great exactness. The difficulty will be
creased, as is easily seen, when there is any amount of elliptic polariza
in the light which is to be examined.

Remedy by simultaneous tints.

The remedy for this difficulty Mr. Jellett sought in the construc
of an analyser in which the tints compared should be *simultaneous*,
consecutive. The double quartz plate of Arago was an attempt to rea
this conception. It has, however, no similarity in principle to, and
not approach in accuracy, the following instrument devised for
purpose by Professor Jellett.

a rhombic prism of Iceland spar, whose longitudinal edges should
e a length of about two inches, or a little more, is cut by two planes
perpendicular to those edges, so as to form a right prism, as in the engraving, Fig. 1.

Fig. 1.

Fig. 2.

Prism cut and divided.

This prism is next divided by a plane S S′ B, parallel to the edges and making a small angle with the longer diagonal of the terminal face D′ D ; one of the two parts into which the prism is thus divided is then reversed, so as to place the base uppermost ; the two parts are cemented together, as in Fig. 2, with the surfaces of section in contact, and ends of the prism thus formed are then ground and polished.

One half of prism turned 180° round centre of plane of section.

Now it is evident from the construction of the prism, that if two rays light parallel to the axis be made to traverse the two parts of the prism respectively, the lines of separation of the ordinary and extraordinary images in these two parts will be C A, C A′, Fig. 3 ; and as the angle between the plane of section and the longer diagonal is small, the angle A C A′ is nearly 180°. Hence the extraordinary refractions in the two parts are in nearly opposite directions ; and if the end at which the light is admitted be so chosen that these refractions shall be *from* the plane of section, the separation of the images will be nearly doubled.

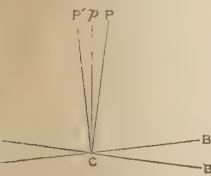
Peculiar refraction in new prism.

Fig. 3.

Now suppose a circular beam of plane-polarized light to traverse the prism in a direction parallel to the sides, and so as to be equally divided by the plane of section, the emergent beam will consist of three separate parts, viz., (1) a circular beam, O C O′, Fig. 3, formed by the union of the two ordinary beams ; (2) two
icircular extraordinary beams, E E′. If, then, the size of the incident
m be suitably determined, these latter may be completely separated
n the ordinary beam, so as to admit of their being stopped by a dia-
agm which allows the ordinary beam to pass ; the instrument will
n transmit a single beam of plane polarized light.

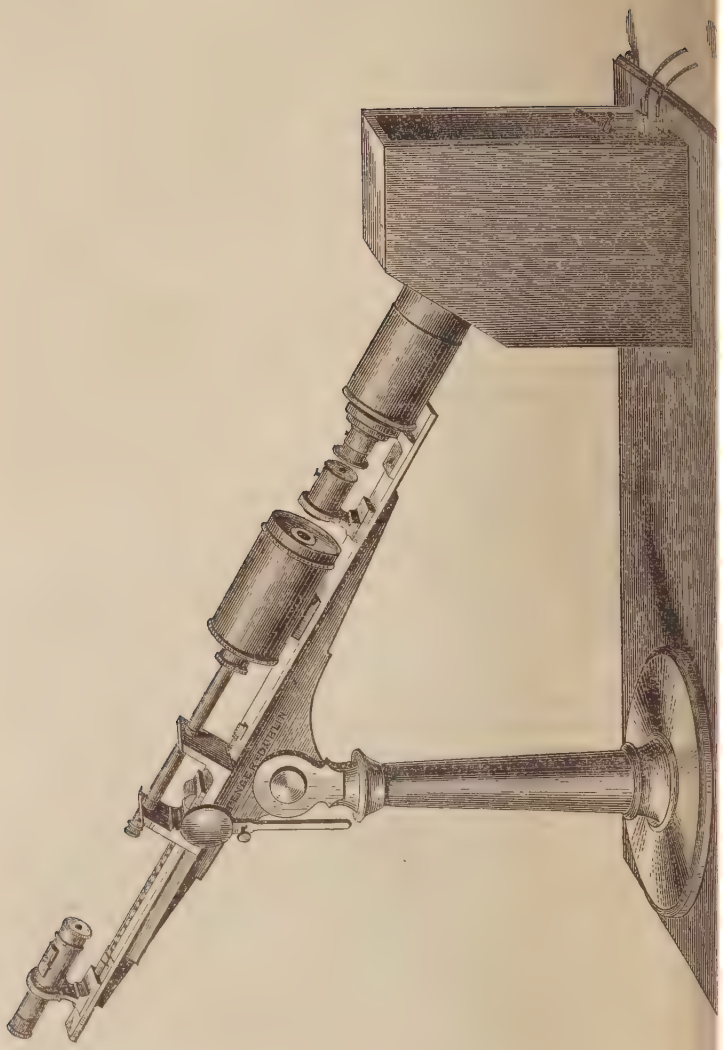
Now it is easy to see that the planes of polarization of the two parts
o which the beam is divided by the plane of section are inclined to each other at an angle somewhat less than double the angle D C S, Fig. 1. Suppose, then, that the plane of the paper being perpendicular to the beam, the traces of these planes of polarization are represented by A B, A′ B′, Fig. 4, and let C P and C P′ be perpendicular to these lines respectively. Let C p be the plane of polarization of the ray to be examined.

Fig. 4.



Then so long as there is any difference
ween the angles P C p, P′C p, the intensities of the two parts of the
m will be different, and conversely, if these intensities be equal,
s evident that the required plane of polarization will bisect the
le P C P′. The prism must therefore be turned on its axis until
equality of tints be established, and when this is done, the
ition C p of the plane of polarization is known. It is not, how-

Fig. 5.



or, necessary to determine the position of the planes P C, P′ C. e observer commences by transmitting a beam whose plane of larization is known, and turning the analysing prism until the ts become equal. The beam whose plane is required is then in-duced, and when the equality of tints has been re-established, the gle through which the prism has revolved, read off on a graduated cle, gives the inclination of the required plane to the known plane. is mode of determining the zero, a process which for perfect accuracy ght to be repeated with each new set of observations, possesses the vantage of eliminating the personal equation of the observer. In amining a beam of any considerable magnitude, there will be found different persons a tendency to think one part of the image darker an another, even when there is no real difference. With different servers, and even in the same person at different times, the part of e image thus preferred may be different, and if the zero were deter-ined once for all this might occasion sensible error. But as in the ethod here given such a preference will equally affect the position of e zero, it can have no influence on the final result.

In the first prism which Prof. Jellett caused to be constructed the gle between the planes C P, C P′ was about 7°. With this prism the nge of error in the determination of a plane of polarization was 7′, e light employed being the diffused light of the sky. Although is was a very much smaller range than he had ever been able to tain with a Nicol's prism, it seemed that a greater amount of accuracy ight be obtained, and as the brightness of the image appeared to be o great, a prism was constructed in which this angle was but half of s former value. With this prism and with the same kind of light the sition of a plane of polarization could be determined to 1′. With rect solar light and a prism in which the planes are still closer, a reater degree of accuracy may certainly be obtained ; in fact, it can be own that by diminishing this angle and increasing the brightness of ie light, so as to preserve unchanged the intensity of the image, the nsibility of the prism will vary as $\cot \frac{\theta}{2}$, θ being the angle in question.

The prism here described is fixed in the eyepiece or analyser of the paratus, the general aspect of which is given in the accompanying ig. 5. But while the rotation of the prism necessary for determining e zero point is effected by little screws fixed to the tube a little below ie ring by which the eyepiece is fixed to the beam on which the axis the instrument is carried, the mechanical rotation of the analyser r the finding of any particular plane is altogether dispensed with, and is function is transferred to a fluid which has the power of turning e plane of polarization in a direction opposite to that which it is tended to determine in the casual observation. This fluid may be y polarizing solution of stationary power. In the present instrument, owever, right or left turning spirit of turpentine is used. Of this pola-zing turpentine the rotating index per inch, tenth, or hundredth of an ch is ascertained as expressed in per cents. of sugar contained in solu-on in the analysing tube. The analysing tube dips into and moves up d down in the turpentine itself. This arrangement will be more telligible by the aid of the subjoined Fig. 6.

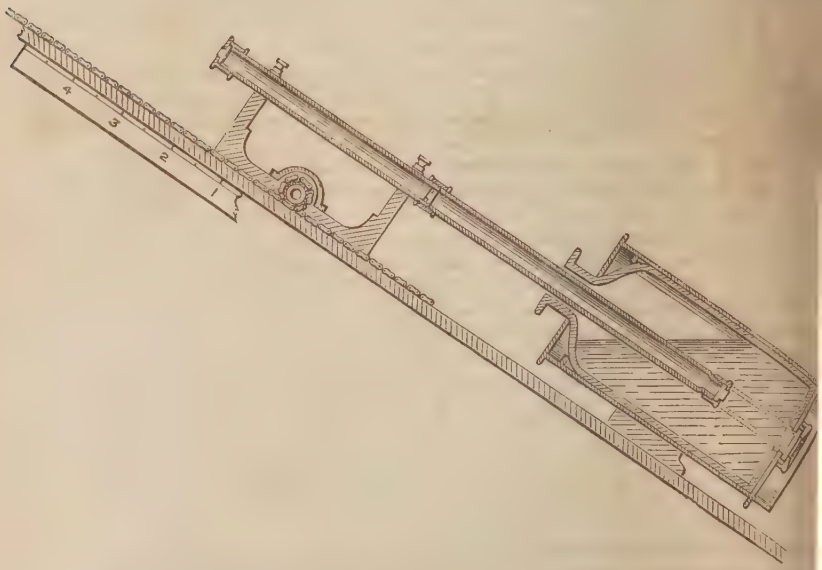
The order of events in an actual analysis now is as follows : (1.) *Find-g of the zero point.* A beam of parallel light produced in the closed ox at the end of the apparatus, by means of the oxyhydrogen-calcium ght and a compound condenser, is thrown in the direction of the optical xis of the apparatus. It passes first through the polarizing prism. he polarized beam then enters the bottom of the turpentine bottle. he long tube containing water is pushed down to the bottom

Fixing of the zero point.

Finding the index of the turpentine.

of the turpentine bottle, until its glass plate rests upon the plain sur face of the inside of the turpentine bottle. The arrow of the indicator is placed upon the zero point of the scale attached to the side (of which a portion is represented in Fig. 6), and the analysing eyepiece is now turned until the tints of the half-circles of its picture are equal. (2.) *Finding of the index of the turpentine as expressed in per cents of sugar.* The tube containing water, and intended to contain the fluid to be analysed, is now filled with a solution of dextrose sugar containing 10 per cent. of sugar, which turns the plane of polarization to the right. If the tube be replaced as before, the tints of the picture in the analyser will now be unequal. The tube carrying the sugar solution is now raised upwards by means of the milled-headed wheel, until the tints of the two halves of the picture in the analyser are again equal. By that means a column of oil of turpentine (turning to the left) will have been inter-

Fig. 6.



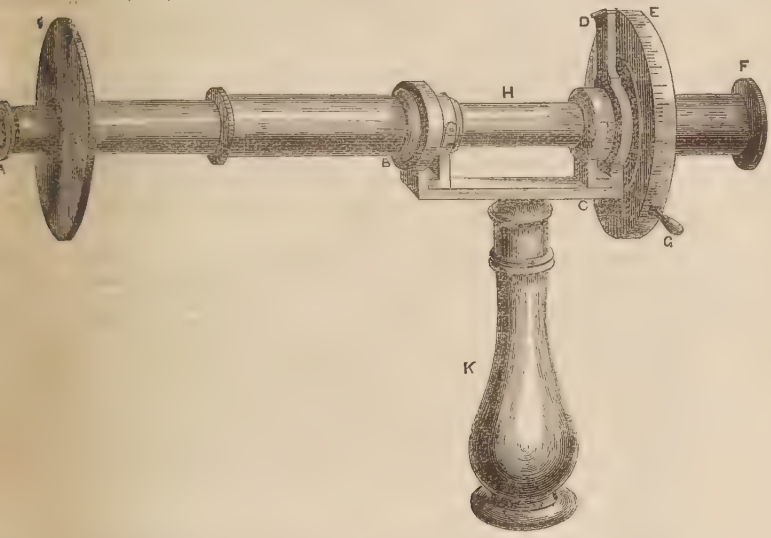
posed between the sugar solution and the polarizer (as shown in Fig. 6 which turns the plane of polarization as much to the left, as the tube fu of ten per-centic sugar solution turns the plane of polarization to the righ Both polarizations will have completely neutralised each other. Sup posing the arrow stand upon 1 of the scale, then a column of one inc of left-turning turpentine has been required to neutralise the pol rization of a solution of 10 per cent. of sugar in the tube. If no a solution containing either more or less sugar be placed into the tub a longer or shorter column of turpentine will be required to neutrali its effects. And as the effect of a column of one inch (in the abo example) is known to indicate 10 per cent., the effect of any lengt or its sugar-indication, can be found by the equation $1 : 10 = t : x$ in which t is the length of the turpentine column measured on th scale, and x the per-centage of sugar contained in the problematic fluid in the tube. I have not entered into minor details of the co struction of this apparatus, such as the chain in connexion with t milled wheel by which the closed tube is moved up and down in t turpentine bottle, or the long lever attached to the milled wheel f

icate adjustment. These must be studied upon the apparatus itself, l like the entire apparatus itself will be found to leave nothing to be ired in respect of mechanism. No other polarimeter approaches s instrument in accuracy for such saccharometrical purposes, as with e it indicates 0·01 % of sugar. But its disadvantages are that it uires powerful artificial light, that it is cumbrous and complicated and st be skilfully managed, and that its price is necessarily very high. It not yet be made to indicate the polarization of any particular ray of ht, say the yellow or the green, and it will probably be better not to empt to complicate it with any arrangement for that purpose.

Wild's Polarimeter.—This instrument, represented in Fig. 7, is very ndy for general purposes in which only approximative results are quired. It is held by the hand at K, and A is directed towards the

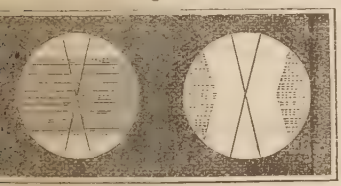
Wild's polarimeter.

Fig. 7.



ght of a candle, oil-lamp, or gaslight, while the eye is applied F. At A the tube contains a Nicol's prism. At B a Savart's olariscope is fixed consisting of thick pieces of quartz with inter- ediate lenses and a wire cross of the shape represented in Fig. 8. he eyepiece F carries a second Nicol's prism, which turns with e disk E, carrying the division of the circle on its circumference. or the greater convenience of manipulation a lever G is fixed in the isk. The zero point and nonius are immoveable at D, and B C is the arrangement by which the handle is fixed to the instrument. I is a black disk, intended to further screen the eye from the direct light, and H is the tube in which the fluid to be examined is placed. When the eye receives the transmitted light of the apparatus, while the divided circle is in any position except those where °, 90°,180°, 270° are exactly incident with the zero mark of D, then a

Fig. 8.



picture sketched in the left-hand circle of Fig. 8 is seen, consisting striæ of interference running horizontally through the entire field vision. But when 0°, 90°, 180°, or 270° are placed exactly upon th zero point at D, the transverse striæ are not visible in the middle of th field, where now the wire-cross alone is visible, as represented in th right-hand circle of Fig. 8. If now the tube X is filled with any flui possessing the property of circular polarization, and is placed into th position indicated in the engraving, and if at the same time the zer point at D is made coincident with 0° of the rotating disk, the striæ interference will be visible, and will only disappear after the disk E ha been turned a little to the right or to the left. In case the fluid con tained in the tube H causes a rotation above 5°, the striæ of interferenc only become weaker, but do not disappear entirely from the middle the field of vision in any position. If the rotation was less than 5°, an the point has been attained at which, as in Fig. 8, II., the interferenc striæ in the middle of the field of vision have disappeared, the observe may read the amount of rotation towards the left or right side which th fluid has effected by reference to the scale.

In case the rotation of the fluid amounts to more than 5°, it is advan tageous to employ monochromatic light for determining the amount polarization. This may be done simply by fixing a plate of red glas before the aperture A, or using as the source of light a spirit flame th wick of which has been drenched with common salt. With such ligh the striæ by interference disappear at a certain position of the analyse may the rotation be ever so great.

I am engaged in elaborating a combination of the method of Broc for determining the specific rotation of polarizing fluids with m spectro meter. Dr. A. Dupré has also informed me that he ha elaborated a new polariscope, but the mechanical details of thes attempts are not yet completed, and their description must therefor be reserved for a future opportunity. Seeing how many of th fluids or products of the animal body possess polarizing action, albu men, gelatine, the various sugars and dextrines, biliary acids, an others, we are not likely to form an exaggerated estimate of the valu of an accurate yet ready and expeditious method of polariscopy an polarimetry for physiological and pathological research.

D, E, F.—*Further Researches on Urochrome.*

Synopsis of the Products of Chemolysis of Urochrome.

A. Fixed Products of Decomposition by Sulphuric Acid.

Mode of obtaining omicholine, &c.

Mode of obtaining.—The mixture of substances which alcohol extracts from the chemolytic products of urochrome (which are insoluble in the acid mother liquor and in water) is evaporated to a small bulk, and then poured into water. The precipitate is collected on a filter and washed until all traces of impurities have disappeared from the filtrates. The matter is now allowed to dry spontaneously, or in vacuo over sulphuric acid (not by heat, as the matter fuses and penetrates into and through the paper), and then in a flask extracted with ether. This operation is very difficult, as the matter cannot be powdered, and in the ether immediately settles in the form of smeary hard lumps. However, after weeks of continued extraction all resinous matter has passed into the ether, and a pulverulent matter, uropittine (perhaps urorubine), and some uromelanine, remain undissolved. The ethereal solution is of a light port-wine red colour, and peculiar, independently of the ether, penetrating odour. When the ether is allowed to evaporate spontaneously, or distilled off, a red syrup remains, which may become hard, but never shows any signs of crystallisation. It was this body which I had described as omicholic acid in the Hastings Prize Essay. The following will show that it is a mixture of two closely related bodies, which can, however, be separated to some extent, though imperfectly.

Separation of omicholine from omicholic acid.

Mode of separating Omicholine from Omicholic Acid.—The resin is treated with concentrated liquor ammoniæ and warmed. A portion dissolves, while another portion settles as a thick brown oily liquid. The alkaline solution is decanted and allowed to stand, when it will deposit more of the oily matter. (This portion is rejected, as being probably a mixture of omicholine and omicholic acid, which it is impossible entirely to separate.) When the alkaline solution in a covered vessel does not deposit any more oily matter, it is considered free from omicholine, and to contain only omicholic acid dissolved with ammonia, and some uropittine. The deposit is omicholine.

Purification of Omicholic Acid.—To the watery ammonia solution some ~~Ba~~Cl_2 is given, which precipitates most of the uropittine and any trace of uromelanine which may be present. (The ~~Ba~~ salt in one case gave 20 % Ba.) The filtrate is acidified with hydrochloric acid, which precipitates all omicholic acid as resin. It is washed with cold water.

If no uropittine be discovered by testing, sulphuric acid is added to th ammonia solution. In this case a precipitate ensues, but much omicholi acid remains in solution. On evaporation of the acid liquid it is depo sited in drops. All omicholic acid is easily taken up by ether fro the acid watery liquid or mixture.

Purification of Omicholine.—The deposited omicholine is mostly fre from uropittine and uromelanine, which easily dissolve in the water ammonia; but it must be well washed with water, and a trace of aci before it is pure.

Ultimate purification by ether.

Ultimate Purification of Omicholine and Omicholic Acid.—Each these bodies is dissolved in absolute alcohol, and to this solution si volumes of absolute ether are added. Any precipitate is impurity either uropittine or other matter. When the mixture remains clear th matter dissolved in it, provided it has been treated as above state must be considered as pure as in the present state of our knowledg it can be obtained.

Chemical properties of omicholine.

Chemical Properties of Omicholine.—It is semi-fluid to resinou becoming harder by keeping. It has a red colour and strong peculia odour. It is little soluble, or insoluble in concentrated caustic ammoni and does not combine with barium salts. It is soluble in caust potash, and again precipitated by sulphuric acid. It is a little solub in cold water on standing, a little more soluble in boiling water, with yellow colour; the solution becomes turbid on cooling. The cold water solution becomes turbid on addition of a little sulphuric acid; on heatin it clears up again. The watery solution, hot or cold, gives a precipitat with (1) sulphuric acid and iodine dissolved in iodide; (2) with mercur oxyde nitrate, yellow white; (3) with the same and subnitrite or nitrit of suboxyde a red reaction like tyroine. All watery solutions ar strongly fluorescent. Silver nitrate gives no immediate precipitate i the hot saturated watery solution, but on standing a precipitate i formed. Its spectral phenomena are most remarkable, and have alread been alluded to on p. 271 of the Report for 1868. The ether solution of a ruby red colour, but fluoresces green in the cone of the sunligh In the spectroscope it shows an absorption band in green.

$$141° 42' - 141° 12' = 0° 30' \text{ Int. 5. R. } \alpha.$$

Near to it in green there is a shading.

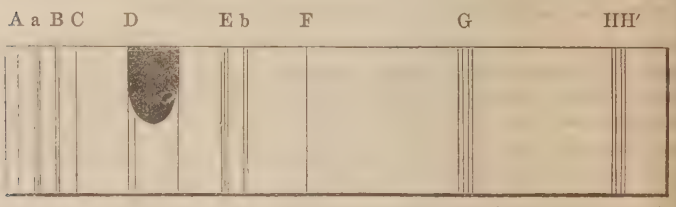

Diagram of Spectrum of Omicholine.

The red and yellow are very brilliant; the rest of the spectrum afte green has a violet hue, without any blue.

Physical and Chemical Properties of Omicholic Acid.—This acid is a red colour, resinous, fusing when heated, and giving out the aromati strong odour reminding of castoreum. It is little soluble in water, mo in ether, best in absolute alcohol. It dissolves in concentrated water

mmonia, and more easily in caustic potash. The ether solution, which ruby red, shows an absorption band in green.

141° 36′—141° 18′ = 0° 18′. Int. 5. R. *α*.

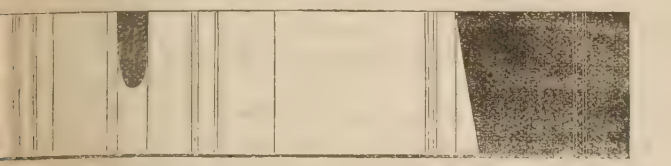

Diagram of Spectrum of Omicholic Acid.

The blue part of the spectrum is coloured violet. Green shaded at 1° 12′. Omicholic acid in chloroform has the same spectrum ; but as e solution can be obtained more concentrated than the ether solution, e violet, blue, and nearly the whole of the green part of the spectrum, e cut off entirely immediately to the right of the absorption band. he ammoniacal solution of omicholic acid has no bands in the spectrum. nicholic acid is red and fluoresces green in the sunlight-cone, or that the electrical lamp, but its phenomena differ slightly from those of nicholine.

Elementary Composition of Omicholine.

Specimen A.

The specimens A. I. and A. II., described originally in the Hastings ize Essay, when lately again examined had been dried and kept in cuo for three years. They were reddish-black, tough, hard, easily sing in heat, and of the most powerful peculiar odour. Six elementary alyses gave results such as might be expected from a mixture of nicholine and omicholic acid, of which the substance was subsequently und to consist.

Omicholine and Omicholic Acid. Specimen B.

Specimen B.

This specimen was suspected to contain traces of uropittine and uroru- ne, and upon it were performed most of the experiments which led to e information relating to the separation of omicholine and omicholic id given in the foregoing. The drops of omicholine, which before eatment with ammonia had been acid, after removal of omicholic acid, d much washing with water, remained alkaline.

From the omicholic acid in ammonia ~~Ba~~ Cl_2 precipitated flakes nich were dried at 100; 0·3364 grm. left after burning and heating th ammonium carbonate 0·1069 grm. barium carbonate, equal to ·28 % of ~~Ba~~ (uropittate). From the filtrates omicholic acid was covered by the addition of hydrochloric acid.

Elementary Composition of Omicholine. B, a.

Elementary composition of omicholine.

1. Dried at 85° C. 0·2621 burned with lead chromate, lastly with ygen, gave 0·6268 $\overline{C}O_2$ and 0·2318 H_2O, equal to 65·22 % $\overline{C}$ and 82 % H.

2. 0·1306 burned as before gave 0·3071 $\overline{C}O_2$ and 0·1207 H_2O, ual to 64·13 % $\overline{C}$ and 10·26 % H.

3. 0·1754 burned with soda-lime, &c., left 0·0396 $\overline{Pt}$, equal to 20 % N.

Treatment of the mixed Resins C.

(α.) *Extraction by cold Ether. Isolation of Omicholine and Omicho Acid.*

The mixture was exhausted with cold ether, which assumed a po wine red colour, becoming lighter at every operation. The ether w

* The symbol (⌣) indicates "precipitated."

porated until a residue of oily consistence remained, which was nd to be a mixture of two bodies, omicholine and omicholic acid. ey were separated as follows—

Separation of Omicholine, C, a, from Omicholic Acid C, b.

The oily resinous residue was treated warm with a large bulk of centrated watery solution of ammonia. One part dissolved and ained dissolved on cooling, *omicholic acid*,—another part remained dubble, *omicholine*. The latter represented a liquid resin of strong ell, and appeared to possess most of the qualities of the substance ned *urerythrine*.

Further testing of Omicholic Acid, C, b.

To the ammoniacal solution barium chloride was added, with the view producing an omicholate. An insignificant precipitate only was ained, insufficient for analysis. The filtrate was rather dark coloured, wing that the barium had precipitated but little matter. The main k of the omicholic acid seemed to be precipitated by hydrochloric d in light-brown flakes ; but it was changed in its properties to the ent of being less soluble in ether and alcohol than before.

b.) Extraction by boiling Ether, and Examination of Products.

The boiling ether seemed to extract more of the two bodies, which e separated as above. To the ammoniacal solution of omicholic acid, , barium chloride was added, and the precipitate filtered off. It was hed with water until the filtrates were free from barium. The pre- ate on the filter was next repeatedly washed with alcohol, when it found that a quantity of uncombined omicholine had been left on filter. During the precipitation of a barium compound, therefore, choline and omicholic acid had been precipitated from the ammoniacal tion. The salt, which remained insoluble in alcohol, was analysed.

0·2369 grm. yielded 0·0715 Ba SO_4, equal to 17·74 % Ba. The lue contained a trace of iron, which was corrected in the following ysis:—

0·1953 grm. yielded 0·0569 Ba SO_4 equal to 17·13 % Ba.

his barium compound therefore was shown to be an admixture of omicholic acid, and not to contain any of this acid. As was proved e fully, omicholic acid does not combine with barium. It is there- a sign of the purity of omicholic acid that its ammonia solution does give a precipitate with barium chloride. Again, Ba Cl_2 is a means urifying the ammoniacal solution of omicholic acid, particularly of which has been obtained by means of cold ether, from another .

nicholine C, a, and omicholine C, b, were united, washed with pure r, and again dissolved in ether. They will in the following be gnated as *omicholine C, a.*

ie ammoniacal solution to which Ba Cl_2 had been added, omicholic C, a, and omicholic acid C, b, were united and treated with hydro- ic acid. A flaky precipitate fell down, which was washed, and in ollowing will be designated as *omicholic acid C, b.*

With these preparations the respective preparations from D. I. w united, because both had been obtained from the extract of urine by mere addition of sulphuric acid without any boiling.

Elementary Composition of Omicholine C, a.

1. 0·3063 gms. dried at 85, (contained like all preparations omicholic acid and omicholine in little boats of glass shaped for the p pose,) were burned in lead chromate, and gave 0·7859 $\mathfrak{C}\mathfrak{O}_2$ 0·2962 $H_2\,\mathfrak{O}$ equal to 69·97 °/₀ $\mathfrak{C}$ and 10·74 °/₀ H. (The water c tained a vestige of copper oxyde dust.)

2. 0·2863 gave 0·7275 $\mathfrak{C}\mathfrak{O}_2$ and 0·2458 $H_2\,\mathfrak{O}$ equal to 69·31 °/ and 9·54 °/₀ H.

3. 0·3193 gave 0·0746 $\mathfrak{P}\mathfrak{t}$ equal to 3·31 °/₀ N.

4. 0·2602 gave 0·0746 $\mathfrak{P}\mathfrak{t}$ equal to 4·06 °/₀ N.

These bodies are evidently well-defined different entities, although they have not yet been obtained in a pure state. They differ from each other, but cannot yet perhaps be absolutely separated from each other. On the other hand, they have so many properties in common, that the one may possibly be derived from the other, or that both may have a common origin. They are both obtained by boiling the watery solution of isolated urochrome with acid, and are therefore probably derivates of urochrome. Their molecular weight has not yet been determined, as no compound appeared definite enough for that purpose.

Remarks.

Importance in kidney diseases.

The importance of these bodies in pathology may be inferred from the fact that they are capable of forming in the human body in certain forms of kidney disease. The breath and the exhalation of the skin in such cases smell strongly of omicholine and omicholic acid. Their nauseous and emetic properties, already observed by Proust, may perhaps contribute to the explanation of that peculiar vomiting which occurs in cases of chronic kidney disease, in which dropsy and œdema have naturally, or by the constant use of the Turkish bath, ceased to be factors of the pathic process.

As it will, perhaps, be many years before (if ever) I can resume this research, and carry it to that completion which I strongly feel it wants, but which the time and materials at my command did not permit me to give it, I must hope that others will supply the desired information. They should extract the materials from several thousand gallons of urine in order to obtain quantity sufficient for all purposes. The quantity of omicholine and omicholic acid which can be obtained from lesser quantities of urine is indeed not small; but of the mixed resins obtained so much is lost in the various processes of purification, that what remains is the lesser portion, and insufficient for that varied analysation and testing which uncrystallisable and uncombinable substances more than any others require.

F.—*Uropittine.*

Synopsis of Preparations of Uropittine.

A. I.	Three elementary analyses. Uropittine perhaps a stage between urochrome and uromelanine.
A. II.	
	Meta-uropittine. Urorubine.
A. III.	From putrid urine. In store.
B. I.	
B. II.	
B. III.	
C. I.	Six preparations obtained, three from each, used and analysed as in special list.
C. II.	
D. I.	
D. II.	
D. III.	
D. IV.	Hypothetical silver-uropittate, from supposed uromelanine.

Uropittine, A. I. and A. II.

The uropittine described in the Hastings Prize Essay had yielded on analysis the

Mean in 100 parts.	Quot. by At. W.	Quot. by N = 1.
C 55·25	4·604	5·32
H 5·57	5·570	6·44
N 12·10	0·864	1·
O 27·08	1·687	1·952

If the latter quotients are multiplied by 7, the number of nitrogen atoms in uromelanine, we obtain uropittine = C_{37} H_{45} N_7 O_{11}. From

is formula that of uromelanine could easily be derived by assuming at uropittine takes up two atoms of oxygen, and loses one molecule carbonic anhydride and one molecule of water.

$$\underbrace{C_{37}\,H_{45}\,N_7\,O_{11}}_{\text{Uropittine.}} + \underbrace{2O}_{\text{Oxygen.}} = \underbrace{C_{36}\,H_{43}\,N_7\,O_{10}}_{\text{Uromelanine.}} + \underbrace{CO_2}_{\text{Carbonic acid.}} + \underbrace{H_2\,O}_{\text{Water.}}$$

n that case the atomic weight of uropittine would be 763.

It is unquestionable that the urochrome, as well during the chemo-tic, as more particularly during the physiolytic process of decompo-tion, absorbs oxygen. During the operations accompanying the paration of uromelanine, much matter, soluble in alcohol and having ne properties of uropittine, is gradually transformed into uromelanine. The above process may therefore express more than a speculative ormula.

Meta-uropittine from Spec. A.

This body resembles uropittine in composition, but differs by being asily soluble in alcohol. It does not fuse in heat. After extraction of natters soluble in ether alcohol easily dissolved this matter. It was recipitated by water, washed and dried at 100° C. It was much less n quantity than urorubine, to be described below.

Analyses: 1. 0·3335 grm. burned in lead chromate gave CO_2 = ·6554 or 53·59 °/₀ C and H_2O = 0·1947 or 6·48 °/₀ H.

2. 0·2645 grm. gave CO_2 = 0·5376 or 55·43 °/₀ C and H_2O = ·1566 or 6·57 °/₀ H

Mean of analyses.	Uropittine A. I. and II.
C 54·51	55·67
H 6·52	5·15

The substance therefore contains more hydrogen than the preparation rom A. I. and II. by its side. Possibly it may be a substance which is et before uropittine or urorubine in its transformation towards urome-anine. Its existence and empirical composition are here noted in order hat future researches may refer to it and decide whether it is a transition roduct or a mixture.

Urorubine from Spec. A.

It had been separated from the uropittine described and analysed in the Hastings Prize Essay. It was easily soluble in cold absolute alcohol, and stood for three months in it to deposit body less soluble (Uropittine). It had then been precipitated by water, filtered and dried in vacuo. It was very hygroscopic, and after drying at 100°, when it did not fuse, always gained from two to three milligrammes under the dryer. After three days of labour the last weighing was assumed as practically correct.

Analyses: 1. 0·2448 grm. burned in chromate gave CO_2 = 0·5808 or 64·70 °/₀ C and H_2O = 0·1515 or 6·87 °/₀ H.

Deducting from the substance 0·0028 grm. of weight, which if it was not oxygen might possibly have been adventitious water, we get urorubine = 0·2420; CO_2 = 0·5808 or 65·45 °/₀ C and H_2O = 0·1487 or 6·82 °/₀ H.

2. 0·2035 burned with chromate gave CO_2 = 0·4852 or 65·02 °/₀ C and H_2O = 0·1266 or 6·91 °/₀ H.

3. 0·3082 burned with soda-lime gave 0·2492 grm. Pt equal to 11·46 °/₀ N.

It is preferable not to assign a formula to this body at present. It contains more carbon than either uromelanine or uropittine, and could be considered as a body less oxydised than either of these two, and standing nearer to urochrome. It contains more than double the amount of nitrogen which is contained in omicholine or omicholic acid.

Hypothetical Silver-Uropittate from D. IV.—An ammoniacal extract from uromelanine D. IV. by evaporation and resolution in water was precipitated with silver nitrate, boiled, filtered, and washed with water. Washings were almost colourless, and free from silver. Dried in steam-closet, afterwards in air-bath at 110°,

(1.) 0·1501 burned left 0·0487, or 32·44 °/₀ Ag.
(2.) 0·1046 do. do. 0·0336, or 32·28 °/₀ Ag.

Thereupon another preparation was made in exactly the same manner, and yielded,

(3.) 0·1326 grm. left 0·0426, or 32·12 °/₀ Ag.

The salt was therefore surmised not to be a uromelanate, but to stand nearer to the uropittates with 38·71 (C, α, 3), and 35·49 °/₀ of Ag.

I look upon these and like analyses as merely tentative. When the same process applied to the same preparation yields the same compound, this constitutes a symptom in favour of the supposition that the compound is definite, *i.e.*, in atomic proportions. By producing a great many such compounds under varying conditions, those which conform to atomic laws are easily found out by their repetition. If instances remain isolated their accidental and non-specific nature is proved. I consider this proceeding the only one which in the present state of our knowledge of these matters can be applied for the obtaining of the precise information which is so urgently required.

Further Treatment of the mixed Resins C.

(*C.*) *Extraction with Alcohol.*

Cold alcohol extract.

The mixed resins, after having been exhausted, first with cold ether, then with boiling ether, were treated with cold alcohol, and the dark solution was filtered. The filtrate (sol. α) after having stood some time had formed a deposit, and was therefore again filtered. A dark brown powder (designated as uropittine, specimen α, 1) remained on the filter.

Precipitate by ether.

The mother liquor (sol. α) was mixed with ether. It deposited a quantity of flaky light brown matter which after resolution in alcohol gave two specimens, which were designated specimens α, 2, and α, 3.

Hot alcohol extract.

The residue, which had been insoluble in cold alcohol, was now boiled with alcohol and filtered hot on steam funnel (solut. β) No deposit formed on cooling, but on first concentration a deposit, specimen β, 1, formed. On second concentration it deposited specimen β, 2. The mother liquor was evaporated to a syrup and mixed with five volumes of ether. It deposited a flaky light brown matter, β, 3.

Insoluble residue. Uromelanine.

After countless alcohol extractions there remained an insoluble residue (it imparted a colour to boiling alcohol, but the quantity dissolved was imponderable). It was dissolved in ammonia, precipitated by H_2SO_4, washed with water, treated with alcohol, dissolved in ammonia, and evaporated to dryness. By its properties, and the analy-

a silver salt of it, it was found to be mainly *uromelanine*. For the atery extract of the dry residue (of which the greater part remained dissolved in the water, as is usual with uromelanine) on being treated ith silver nitrate, boiled, filtered, and washed, gave the following results analysis. Dried at 110°.

1. 0·1476 grm. left 0·0198 grm. or 13·41 °/₀ of Ag.
2. 0·1550 grm. left 0·0212 grm. or 13·67 °/₀ Ag.
3. 0·3458 grm. burned with soda-lime left 0·2662 Pt, equal to 10·91 °/₀ N.

Neutral silver uromelanine, C_{36} H_{40} Ag N_7 O_9 requires 13·13 °/₀ Ag. nd yielded in the mean 13·47, which is almost the same as the fore- oing mean 13·54 °/₀ Ag. Nitrogen required, if one H_2O leaves ne salt 11·92, found formerly 12·47. If no water leaves the neutral lver salt, it requires 11·66 °/₀ N.

Uropittine; Specimen C, α 1.

The substance was dissolved in ammonia and the alkaline solution reated with Ba Cl_2. Precipitate washed and dried at 110° C. Ba salt.

0·1204 gave 0·0414 Ba SO_4, equal to 20·21 °/₀ Ba.

Note.—A quantity of omicholic acid (Specimen B) in ammonia was reated with Ba Cl_2. After treatment like the precipitate from C, b, a ompound was obtained, of which dried at 95° Note. Similar Ba salt obtained from omicholic acid.

0·3664 gave 0·1069 grm. Ba CO_3 equal to 20·28 °/₀ Ba.

This would therefore amount to a proof that omicholic acid, when it ields a precipitate with barium salts, contains uropittine. By the ompound C, b, α, this proof was not definitely afforded.

It was also essayed to prepare a Ba salt from a neutral solution, ut the quantity ultimately obtained was too small for analysis.

Uropittine Silver from Specimen C, α, 1.

Uropittine (C, α, 1) dissolved in concentrated ammonia was evaporated o dryness. Of the residue a small part only dissolved in water, the reater part remained undissolved. Silver-nitrate was added and the ixture boiled. The precipitate was washed on the filter until the ltrates were free from silver and colourless. Ag salt, 21·39 °/₀ Ag.

1. 0·2412 grm. left 0·0510 grm. or 21·14 °/₀ Ag.
2. 0·1118 grm. left 0·0242 grm. or 21·64 °/₀ Ag.

Mean. 21·39 °/₀ Ag.

3. 0·1194 grm. burned in soda-lime, &c., gave 0·1033 Pt equal to 12·27 °/₀ N.

Bearing with Ammonia of Specimen C, α, 1.

The uropittine was dissolved in ammonia, the solution evaporated to omplete dryness, and the salt redissolved in water. To the solution (a art remained undissolved) hydrochloric acid was added, whereby the ropittine was precipitated. The latter was collected, washed, and ried at 100° upon a weighed filter.

Dry uropittine = 0·1003 grm.

The acid filtrate yielded chloride of ammonium, which by the usual treatment left 0·081 grm. of Pt. This yields upon 100 uropittine 13·90 parts of ammonia, or in 100 parts of compound 87·8 uropittine and 11·20 °/₀ ammonia.

This is more than a molecule of ammonia for even a small formula of uropittine. Indeed as only a part retains ammonia, another becomes insoluble, the instability of the compound is proved. But it is interesting that even in a solution so treated there may be more than a quantity of ammonia necessary to produce a neutral salt. It must, however, not be forgotten that the quantities of material employed were very small.

Uropittine C, α, 2.

This substance was precipitated by ether from the solution in absolute alcohol of the mixed urinary resins. It was dried at 100°, and did not become soft.

1. 0·1596 grm. burned in lead chromate, ultimately in oxygen, yielded 0·3529 CO_2 and 0·0904 H_2O, equal to 60·30 °/₀ C, and 6·29 °/₀ H.

2. 0·2215 grm. burned in lead chromate without the employment of oxygen gave 0·4865 CO_2 and 0·1405 H_2O, equal to 59·90 °/₀ C and 7·04 °/₀ H.

3. 0·2346 grm. burned with soda-lime, &c., gave 0·1727 Pt, equal to 10·44 °/₀ N.

4. 0·2789 grm. burned, &c., gave 0·2066 grm. Pt, equal to 10·50 °/₀ N.

Uropittine Silver.

From Prep. C, α, 3 (boiled preparation).

The specimen of uropittine used for the preparation of this salt was precipitated by ether from an alcoholic solution of mixed urinary resins. It was dissolved in ammonia. To the solution some more uropittine was added in order to ensure its neutrality; thereupon it was precipitated by silver nitrate. After having been boiled, a proceeding which was necessary to cause the immensely voluminous precipitate to contract, it was collected on a filter. It appeared of a dark grey colour, while the mother liquor was slightly yellow. The washing liquors were of a darker colour than the mother liquor, and fluoresced strongly. Dried at 110°,

1. 0·2115 left 0·0818 grm. of Ag., or 38·67 °/₀.
2. 0·1837 left 0·0712 grm. or 38·75 °/₀.

Mean of these analyses is 38·71 °/₀.

: leads to 279 as the atomic weight of the salt, and 172 as the atomic ght of the organic residue (Ag. = 108). This is very near to the ecular weight of hippuric acid ($C_9 H_9 NO_3$) = 179; but it is not ceivable that this acid should be precipitated by ether, and be in- ble in water, except after having undergone great and peculiar rations.

0·3241 grm. burned with lead chromate gave 0·4340 CO_2 and 164 H_2O, equal to 36·52 % C and 3·99 % H.

0·2919 burned with soda-line, &c., left 0·1430 grm. Pt, equal to 4 % N.

Uropittine Silver. Second preparation from C, α, 3.
(Not boiled.)

ropittine obtained by ether from alcoholic solution of mixed resins, purified by solution in ammonia and subsequent precipitation by rochloric acid, was again dissolved in a few drops of ammonia, and solution made as neutral as possible by digesting it with an undis- ed excess of uropittine. The filtered solution was precipitated by r nitrate, and the precipitated silver-uropittate was collected on a and washed. The mother liquor and the filtrates were colourless. precipitate was dried at 110° C.

Uropittine silver. Not boiled.

0·2150 grm. left 0·0770 grm. or 35·81 % Ag.
0·2402 grm. left 0·0845 grm. or 35·17 % Ag.
ean of these analyses 35·49 % Ag. leading to 304 as the Mol. W. ie salt, and 197 as M. W. of uropittine.

0·3144 burned with lead chromate left 0·4375 CO_2 and 0·1216 , equal to 37·95 % C and 4·29 % H.

0·2708 burned with soda-lime, &c., left 0·1260 Pt, equal to % N.

0·2345 gave 0·1058 Pt, or 6·39 % N.

ie preceding shows that the former preparation was probably de- osed (oxydised) by the boiling of the precipitate. This effect is

well known to occur in many silver-salts. It washazar ded in th instance because it had been found that the uromelanine-silver salts bo boiling without changing in composition.

Uropittine Barium, from C, α, 3.

Uropittine Barium.

It was attempted to produce a barium salt. The uropittine w obtained by precipitation with ether from an alcoholic solution of mix urinary resins. It was dissolved in ammonia, and barium chloride add to the slightly ammoniacal solution. The mother liquor after filtrati was dark coloured, but the washing water became constantly lighte until it appeared only slightly yellowish at last. Although 0·5 grm. uropittine had been dissolved, only 0·1605 grm. of barium salt we obtained.

Only analysis: 0·1605 grm. gave 0·0194 grm. Ba SO_4, equal 7·10 % Ba.

Uropittine-barium is therefore not insoluble in water. Howev 7·10 is near 7·20 % Ba, which was found in dibarytic penta-urom nine ($\tilde{U}r_5 Ba_2$). Possibly, therefore, the uropittine might have o tained thus much of uromelanine (still soluble in alcohol). It however, evident that from such extremely needy data no opinion c properly be formed.

Uropittine, Specimen C, β, 1.

Ca salt.

It was attempted to produce a neutral solution of this body evaporation of its ammonia solution. By addition of Ca Cl_2 was p duced:

Uropittine Calcium.

Analyses: 1. 0·2069 grm. gave 0·0128 Ca SO_4 equal to 1·81 %

„ 2. 0·1944 grm. gave 0·0116 Ca SO_4 equal to 1·75 %
Mean 1·78 % Ca.

„ 3. 0·1840 grm. yielded 0·1578 grm. Pt, equal to 12
% N.

If uropittine had a composition and atomic weight close to tha uromelanine, this compound might be considered as containing 3 1 Ca. This compound would require 13·13 % of N. But if ur tine have a smaller molecular weight, the figures found for Ca lea no acceptable formula. They show no parallelism to the Ba above described. A zinc salt 3 Ür : 1 Zn. is amongst the compo observed.

Uropittine, Specimen C, β, 2.

Ba salt from alkaline solution.

It was dissolved in a slight excess of ammonia, Ba Cl_2 added, dried at 110°.

0·2560 gave 0·0948 Ba SO_4, equal to 21·77 % Ba.

Ba salt from neutral solution.

A solution of uropittine in ammonia was evaporated to dryness, the residue treated with water. A part dissolved an another rema insoluble. To the solution Ba Cl_2 was added, which produced a precipitate. This was collected on the filter and washed until

. were free from Ba. The last filtrates were slightly coloured
from Ba. The bulky precipitate shrivelled to an insignificant
during drying in the steam oven, and could not be separated
e paper sufficiently clean to be analysed.

Silver Compound of this preparation.

as dissolved in ammonia and the solution evaporated to dryness, residue only a small part dissolved in water, the rest remained le. Silver-nitrate was added and the mixture boiled. The pre- was washed upon the filter until the filtrates were colourless e from silver. Dried at 110° C. Ag. compound, 27·14 °/₀ Ag.

1. 0·1628 grm. left 0·0442 grm. or 27·14 °/₀ Ag.

me Silver Compound obtained from another pure specimen of Uropittine, C, β, 3.

uropittine had been precipitated by ether from an alcohol n. It was dissolved in ammonia, evaporated, and precipitated er-nitrate. The washed precipitate, which had not been heated, ied in vacuo over sulphuric acid, light being carefully excluded. ned a glistening, blackish, violet brown mass. Same Ag. compound.

0·346 grm. left 0·0937 grm. or 27·0 °/₀ Ag.

esearches on the Derivates of Hematocrystalline, the Colouring Matter of Blood, continued.—On Hematine, continued.

quantity of blood containing the colouring matter, which had recipitated by alcohol, was mixed with carbonate of potash, and rds digested on a steam bath with a large proportion of alcohol. red alkaline solution was obtained. To this an alcoholic solu- tartaric acid was gradually added, until the red precipitate thrown down redissolved to a certain extent. Thus the colour- tter was separated from the albuminous matters; the former dissolved, the latter stained brown remained as a precipitate le in the acid fluid. The liquid, which now consisted of an acid n of hematine and some impurities, was evaporated at a tempe- not exceeding 75° C. to about one-tenth of its bulk. A minute y of black crystals of microscopic dimensions separated on the cooling, together with some fatty matters and small crystals of erine. Various proceedings were adopted to purify the substance, y failed to give the results required. Mode of obtaining from alcoholic blood-cake by tartaric acid.

he blood-cake was then pounded with oxalic acid, and the mix- gested with alcohol. *b*, by oxalic acid.

was also extracted by means of alcohol and a little sulphuric *c*, by sulphuric acid.

proceedings *b* and *c* gave materials which were too impure to t further treatment.

Three gallons of blood were treated with seven times their bulk, gallons of a cold solution of potash carbonate, containing one weight of the salt in two parts of water. A thickish soup-like e resulted, which was filtered on square pieces of calico extended frame. The filtrate was not nearly colourless. The precipitate d up in the calico filters and pressed, gently at first, and more *d*, by potash, tartaric acid, and alcohol.

tightly afterwards, until all the liquid was pressed out as muc possible. The compressed cakes were then treated with alcohol, and carbonate of potash solution which separated on standing was po off. The residue was then again well pressed, and now formed sistent cakes. These were crumbled and dried at the ordinary te rature by standing spread out in flat basins. This material was triturated with warm absolute alcohol, and then digested with a quantity of the same at a temperature not exceeding 40° C. solution was filtered off and then treated with an absolute alcohol tion of tartaric acid. The potash was thus precipitated and the li tine remained dissolved. Enough acid was added to cause the li to show a decidedly acid reaction when the litmus paper first di into the alcohol was moistened with water. After about a third o bulk of the liquid had been evaporated below 40° C, all the hem was deposited on cooling in very minute bluish-black crystals. further evaporation not much more hematine was gained, and little deposited was exceedingly impure, resembling a brown matter. This matter was soluble in alcohol, insoluble in water, attacked by nitric acid and yielded a colourless solution.

Hematine crystals.

The hematine crystals were rhombic plates. They grouped t selves frequently with their edges upwards, so as to resemble cluste needles. They were filtered off on a very close paper filter, wa with water and absolute alcohol. The microscope revealed the pre of slight traces of foreign matters, which it was determined to re by recrystallisation.

H.—*Intermittent Hæmaturia, s. Hematinuria, s. Cruenturesis.*

Intermittent cruenturesis.

There is a rare form of disease, which has been described number of observers, but more particularly by Dr. E. H. Gree in a learned and instructive article in Edinb. Med. Journ., May He says that in all the cases which he has seen of this disea attacks have been excited by the same cause, have taken the form, exhibited the same general group of symptoms, and ru same definite course. The immediate exciting cause of the attack been invariably some definite exposure to cold or wet. The form by the attacks has been invariably that of paroxysms; these c on suddenly, almost immediately after the chill was experience passing off rapidly when the effects of the chill had been counte and the patient had become thoroughly warm. The general gr symptoms has been invariably the same, the additional ones occas exhibited being apparently due to an unusual degree of constitu disturbance. In every instance the paroxysms have begun wit ness of the extremities, followed by general chilliness, amounting severer attacks to rigors. In like manner, in every case, the chi or shivering has been attended by a feeling of weight and pain loins, and by pain or a sense of weakness or stiffness in the lower The chilliness has been usually, though not always, followed imperfectly marked febrile hot stage. The patients have inv passed, during the paroxysms, urine looking as if it were mixe blood, and identical in general character. And lastly, the same course has been run by the paroxysms in every case. From half a to two hours after the chilliness or rigors the patient has never f pass the first dark-coloured urine, which has always been highl minous, and has contained numerous crystals of oxalate of lim more or less of brownish or yellowish red, amorphous granular

w hyaline casts, but only occasionally some stray blood cor-

At each succeeding micturition after the chilliness, the urine ariably shown more or less diminution of colour, of albumen, of of lime, and of its other abnormal constituents; resuming its character and appearance by the second or third micturition ight attacks, and usually by the fourth or fifth after severer sms. By the second day after an attack the patients, as a rule, gained their ordinary degree of health and strength, and have d well until some fresh exposure has brought on a new attack of mplaint. Most of the patients suffering from this disease have same pale, sallow, cachectic aspect, two of them having been ly jaundiced, and the others having all had at times an icteroid kin.

it appears that intermittent hematuria is a definite disease, due in s to the same remote constitutional cause. The only medical nt which appears to have any effect in diminishing the liability r from the paroxysms on every exposure, is treatment directed, the intervals, towards the improvement of the general health and ngthening of the patient's constitution. Once the paroxysms t in, the most simple means of restoring warmth are all that it is le to use. The short duration of the paroxysms, the very general of blood corpuscles from the urine, even at the time of the ms, and the complete recovery of the normal character of the ithin a few hours after their subsidence, seem to show that n be no cause of hæmorrhage in the kidneys themselves, but hat the disintegrated blood traverses through the walls of the sels in the Malpighian bodies. For this reason Dr. Greenhow the kidneys rather as the organs of elimination than as the seat isease, and considers the renal irritation, the existence of which ested by the pain in the loins and by the presence of the casts, asionally also of stray blood corpuscles in the urine, to be a ry affection consequent upon congestion of the kidneys produced sudden and unusual strain thrown upon them. Possibly the ms may consist in the sudden disintegration of an unusually antity of blood corpuscles, setting free so considerable an amount to-globuline that it cannot undergo the normal changes, but is ed through the kidneys in a comparatively unaltered state.

gst the English medical authors who have related cases of tent or paroxysmal hematuria, are, besides Dr. Greenhow, Sir Watson, Dr. Elliotson, Dr. Prout, and more recently Dr. G. Dr. Dickinson, and Dr. Gull. Several of these authors have ed the disease to be of malarious origin, and there is no doubt some of the cases published the patients had also suffered from But on the other hand, not one of Dr. Greenhow's patients had from ague, and some of them at least had never visited a mala- strict. The same absence of malarious influence has been noted Pavy and Dr. Murchison in cases published by them in the gical Transactions. The disease in fact merely resembles ague termittent form, and in its commencement with rigors, which are , however, by only an imperfect hot stage and rarely by a g stage. It differs from ague in not being periodical, and in g, apparently, a fresh exposure to cold or damp to excite each paroxysm. The history of most of the cases seems clearly to the existence, in all the patients, of some sort of dyscrasia, upon he external chill acts only as the immediate exciting cause aroxysm. Many patients suffer from so-called rheumatic pains

during the paroxysms. Some patients suffered from such pains times, but this was probably due to secondary syphilis with whic were afflicted at the same time. No post-mortem examinatio ever been made of any case.

Spectroscopical and chemical examination of the urine.

Spectroscopical and Chemical Examination of the Urine.— urine, which had been kindly forwarded to me by Dr. Greenho about an ounce and a half in quantity, of a brownish red colo turbid by a brownish red precipitate. This was filtered off, a testing shown to be hematine in the same state as the hematine wh precipitated by acetic acid from a watery solution of blood on sta

The filtrate was now more red than brown, clear, and port wi in transmitted light. In a layer of $1\frac{3}{4}$ centimetres in thickness spectrum—

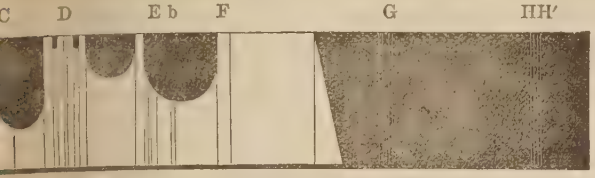
Diagram of Spectrum of Urine in Intermittent Hematuri

At first sight this spectrum offered a remarkable similarity to cruentine described in the Appendix to the 10th Report. It was, h clear from chemical reaction that cruentine could not be prese boiling of the urine the entire amount of colouring matter wa lated, and from the coagulum alcohol and sulphuric acid e hematine only. This pointed to hemato-crystalline, with the s of which the bands β and γ nearly coincided.

bands α and β then appeared to coincide with two of the bands matine in acid solution. By measurement this was found to be the case.



gram of Spectrum of Acid five-banded Hematine in Alcohol.

urine was now treated with a reducing solution of sulphate of de of iron in tartrate of ammonia with excess of this alkali, when ur bands immediately disappeared, and one broad band was present ir place.

1. 55 to 82 = 27. Int. 6.
Rest very dark. Cut off at 110.

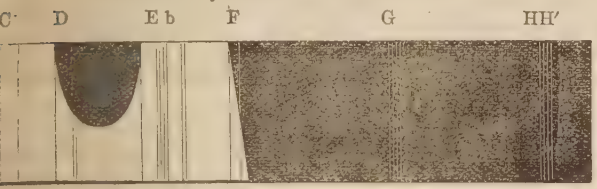


Diagram of Spectrum of Urine treated by reducing Fluid.

violent shaking with air the broad band disappears, and the former do not reappear. The fluid is extremely turbid, and there ns even on dilution with water a very faint continuous spectrum ut any bands. Nevertheless it is clear that the reaction of reduc- ndicates the presence of hematocrystalline as well as of hematine, omparison of the spectra of these substances in the reduced state he spectrum just given will show.

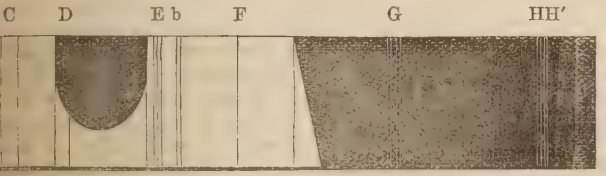

Diagram of Spectrum of reduced Hematocrystalline.

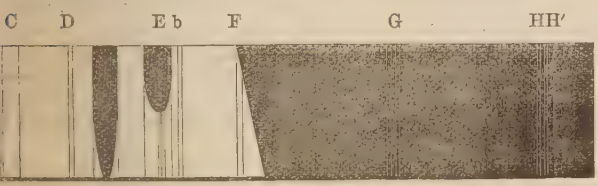

Diagram of Spectrum of reduced Hematine.

will be seen from these spectra that the bands of reduced hematine ematocrystalline necessarily coincide, so that the separation of the

bands of reduced hematine cannot appear, just as in the original spectr of the urine the bands 2 and 3 of four-band hematine, or the ba 2, 3, and 4 of five-band hematine, coincide with the two bands of hema crystalline. All facts therefore show that hematocrystalline and hemat in about equal proportions are present in the urine in question, and only anomaly, which may perhaps yet be explained by the compl character of the fluid, is that on shaking with air of the reduced flu although the one band disappeared, none of the original bands re peared. Somehow or other the substance had been changed by t operation.

The urine was extremely acid, and the excess of acidity seemed be due to a volatile organic acid, probably *acetic*. On standing the ur gradually deposited a flocculent brown precipitate of hematine, and bands of hematine in the spectrum became "pari passu" much pal while the fluid became redder. The same bearing was observed i mixture of watery blood with a little acetic acid. During my researc on cholera I also once observed an extract from muscle present same spectrum as the above urine, but not having powerful light at command I was unable to follow the observation in all its details. T extract from muscle also contained some acetic acid, and on compari of the spectrum then observed and measured I have no doubt that it w due to the presence of a mixture of hematine and hematocrystall (myochrome).

Conclusions.

These observations lead to the following conclusions :—

1. The urine in so-called paroxysmal hematuria contains hematocr talline and hematine in solution. 2. The hematine also occurs a precipitate which increases on standing. 3. There is no proof of presence of dissolved albumen apart from the coagulable hematocr talline (see, however, 5). 4. It is probable that in this disease a sm quantity of blood is somehow or other dissolved, *e.g.*, by bursting o Malpighian glomerulus, and mixing of the blood with effused urin water, or by other means. 5. The hematocrystalline so effused is part transformed into hematine (and some other body, possibly album in a precipitated flocculent form), which for a time remains dissolved the fluid, but is gradually deposited in the insoluble form. 6. T transformation is probably due to the morbid evolution in a certain p of the kidney of a quantity of organic acid, possibly acetic acid, wh dissolves the hematine and imparts to the urine an unusual and v high morbid degree of acidity. 7. The presence of oxalate of lime the urine is no great anomaly, but if it has any significance by be present in large quantity would point in the same direction as presence of acetic acid. 8. Acetic acid by itself is also no anom it being a normal ingredient of urine, as I shall show in an exten research to be published on a future occasion. 9. But its prese in a concentrated form in a certain part of the kidney-tubes, where other urinary constituents, notably urea, were not yet secreted mixed with the hematocrystalline solution, so that it could transf a part of the effused hematocrystalline into hematine, is a great anom and perhaps the essence of the disease. 10. Possibly the acid itsel the cause of the effusion of the blood, of its solution, and partial tr formation.

I believe this to be the first instance in which hematine, hith known as an art-product of the laboratory only, has been proved t present in an organic morbid fluid as the product of the diseased pro itself. The name of "hematinuria" which has been proposed for disease seems to me undesirable, because it would specify only feature of the disease, and would unduly neglect the presence of hen

stalline. Also "hematuria," being applicable to cases in which od appears in corpuscles, does not appear to be a good denomination the new disease. I would suggest "*cruenturesis*" (not cruen- ıresis) as a suitable term; expressing the "*mictus cruentus*" without attempt to define the particular coloured ingredients.

I.—*On Cruentine, continued.*

n the report for 1868, I described a series of new derivates of ıatocrystalline under the name of *cruentine*, and distinguished the eral bodies from each other principally by names derived from their ctral phenomena. All the bodies thus described had been extracted ın the original cruentine sulphate by means of alcohol, and were refore either sulphates, or neutral, or made alkaline after extraction. t their common property was that of being soluble in alcohol. This vent, however, left a large quantity of the original sulphuric acid duct undissolved, even after many extractions at the boiling heat. this insoluble part the following inquiries were directed. It was nd that the boiling alcohol solutions on cooling deposited also this uliar cruentine, which by itself was insoluble in alcohol, even on ling. It is therefore soluble in the boiling alcohol solutions of the l cruentates, but not in the cold.

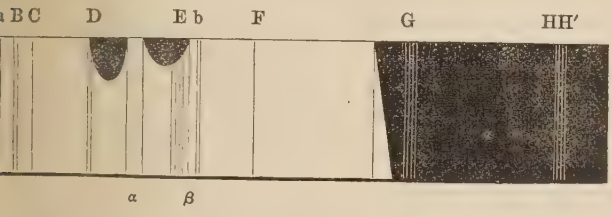
Two-banded Cruentine.—The substance left insoluble by the alcohol s a gelatinous light-red matter, of great volume, as was ascertained a drying experiment. It was soluble in sodium carbonate, and wed a spectrum of two bands— Two-banded cruentine.

1. 60 to 74 = 14; int. 4; R. α.
2. 78 „ 92 = 14; „ 3; „ β.

ıen precipitated from this solution, and treated with an excess of lrochloric acid in much water, a red solution is obtained, which can liluted to any extent without depositing the cruentine. This has ctrum—

1. 60 to 72 = 12; int. 3; R. α.
2. 77 „ 92 = 15; „ 2; „ β.

e to 153, where spectrum is cut off.



gram of Spectrum of Two-banded Cruentine in Hydrochloric Acid and Water.

This body has therefore intrinsically the same spectrum in alkaline in acid solution, while all the other varieties of cruentine hitherto erved, as also hematine, change their spectra greatly when passing of the alkaline into the acid state, or vice versâ.

Effect of reducing Agents.—By the addition of ammoniacal tartrat of iron suboxyde sulphate the band β is much weakened, and all bu disappears, but the band α is not much influenced, particularly n change in its position effected.

Effect of reducing agents.

Reactions of Hydrochlorate of Two-banded Cruentine.—The cruentin was dissolved in sodium carbonate, and filtered; it was then precipi tated by hydrochloric acid, washed by decantation and redissolved i water acidulated with hydrochloric acid. It was allowed to stand, whe a slight turbidity of fat rose to the top, and another portion subsided it was then filtered, and the solution in sodium carbonate and dilut acid was repeated until the substance was steady and uniform.

Reactions of hydrochlorate of two-band cruentine.

Platinum tetrachloride produced a precipitate in the solution, whic contracted on boiling and remained insoluble in boiling alcohol. *Th precipitate had the spectrum of two bands just like the original solu tion.* The filtered mother liquor had no spectrum. The deposits fro the second, third, and fourth boiling alcohol extract of cruentin sulphate were purified as above, and combined with platinum fo analysis.

$\mathrm{Pt\,Cl_4}$.

Analyses.—1. 0·4305 grm. dried at 120° to 130°, on burning lef 0·046 grm. residue, from which hydrochloric acid extracted 0·002 grm iron oxyde. Pt = 0·044 or 10·22 %.

2. 0·6625 of same preparation, left 0·075 residue, from which hydro chloric acid extracted 0·0055 grm. iron oxyde, Pt = 0·0695 grm., o 10·49 %.

The mean 10·35 Pt leads, if the small quantity of iron, amountin to less than 1 %, be neglected, to an atomic weight of 784. From nucleus of this magnitude the molecular weight of uromelanine, 73 might easily be derived.

$\mathrm{Hg\,Cl_2}$.

Mercury perchloride gave no precipitate even on boiling; the band remained, and appeared remarkably like the blood spectrum. (It wi be seen below that the solution by boiling for some time acquired th property of being completely precipitated by this salt.)

$\mathrm{Cd\,Cl_2}$.

Cadmium chloride gave no precipitate, and the bands remained.

Cu acetate. Na and Zn acetate.

Copper acetate gave a precipitate containing all the cruentine; but a sodium acetate and zinc acetate also produce the complete precipitatio of the cruentine, it is probable that acetates only act by displacing th solvent HCl, the free acetic acid being incapable of retaining the crue tine in solution.

$\mathrm{Fe_2\,Cl_6}$.

Iron perchloride produces no precipitate, but intensifies the colo greatly, making it yellowish red.

$\mathrm{NH_3}$.

Ammonia makes the pink solution dark red, and greatly intensifies th absorption of the spectral bands. In this ammoniacal solution—

$\mathrm{Ca\,Cl_2}$. $\mathrm{Ba\,Cl_2}$.

Ca Cl_2 and Ba Cl_2 produce precipitates on boiling, which are light red colour, *and both show the two-band spectrum when expos suspended in the fluid before the slit of the spectroscope.*

The barium compound was analysed:

(1.) 0·373 grm. left 0·0221 of residue, being barium-sulphate, and ir and copper oxyde, or 3·46 %. Of this 0·0170 was the amount of t latter oxydes, leaving $\mathrm{BaSO_4}$ = 0·0051, consequently it contain less than 1 %, namely, only 0·8 % of Ba.

(2.) 0·6088 grm. left 0·0378 residue after treatment with H_2S = 3·64 %. Of this 0·0302 was iron and copper oxyde, leaving o

0076 $BaSO_4$, equal to 0·73 °/₀Ba. Mean of Ba found = 0·765 °/₀. is would lead to an atomic weight of 17908, which seems quite possible. It is therefore clear that the Ba compound of two-banded ruentine decomposed during the washing with boiling water, to which preparation, on account of its enormous bulk, had been subjected. ashing with cold water was found to be quite impracticable. The pper was derived from a copper still in which the alcoholic extraction d been made. The iron is a residue of that contained in the hemato-ystalline.

A second preparation, washed once by filtration, lastly by repeated cantation, being too gelatinous to admit of washing on the filter, ve—

(1.) 1·6616 grm. (became heavier during heating to 120°) left 0992 residue.

(2.) 1·2136 left 0·0696 grm. residue. When the copper was dis-vered the analysis was not followed out any further.

Dissolved in caustic potash and alcohol, with a little sodium carbonate KHO. led, and allowed to stand for a week, two-band cruentine assumes following elegant property. *Itself being red it fluoresces light green;* yields a beautiful light green, of a pure and lively tint, when luenced by the light-cone collected from the sun by a quartz colli-tor. It reminds much of the phenomena of *omicholine* and *omicholic id*. It retains the two bands, but they are more feeble, particularly second band is almost like that obtained by reducing agents. This ectrum reminds also of omicholine.

Effect of protracted boiling upon two-banded Cruentine Hydro-chlorate.—The object of this process was to ascertain whether the iron uld be removed from the cruentine or not. The solution was boiled ree days long. After two days boiling the spectrum of the solution s unchanged, but black matter was continuously deposited. *The id filtrate* from the dark matter on the third day was dark red, and *s completely precipitated by mercury perchloride.* (In a solution of o-band cruentine in HCl sublimate produced a precipitate which solved on boiling. On cooling the solution gelatinized completely. violent shaking the flakes separated and left the liquid colourless. ere is therefore a third variety of cruentine, and of behaviour with ercury perchloride.) The precipitate had a curious dirty grey colour, d no red or brown about it.

Effect of boiling upon cruentine hydrochlorate

Reactions of filtrate $HgCl_2$.

Potassium ferrocyanide produced a copious complete precipitate in the rate, all matter being deposited of a dark dirty greenish colour. The ution contains apparently much free iron, as the fluid above the pre-itate deposits a second *blue* precipitate, Prussian blue. Sulphocyanide ve a red precipitate. Consequently the hydrochloric acid extracts n and a little organic matter, to which sulphocyanide adheres. But insoluble residue contained iron in quantity (also copper, if such l been added to the solution).

Ferrocyanide of potassium.

The hydrochloric acid solutions filtered from the deposit, and all washing waters, were repeatedly evaporated to dryness, and left a ck residue. This dissolved in concentrated H_2SO_4, and with alcohol solution gave spectrum of two-banded cruentine sulphate. The d was very opaque. The water solution with caustic potash gave ctrum of four-banded cruentine. It contained great quantities of n (and the impure specimen alluded to also of copper).

The residue insoluble in HCl.

Cruentine made insoluble by boiling with Hydrochloric Acid.—The cruentine which had become insoluble in hydrochloric acid by boiling was washed with water. It remained insoluble in any kind of hydrochloric acid, concentrated or dilute, insoluble in ammonia, in alcohol, with or without acid or alkali. In its half-dried state it was, however, soluble in concentrated sulphuric acid. A mixture of a drop of this solution with alcohol gave the cruentine sulphate spectrum. The solution after standing 24 hours was poured into much water, and appeared almost completely precipitated. It was twice washed by decantation. The residue or deposit did not dissolve in concentrated or dilute hydrochloric acid, even on boiling, but dissolved easily in alcohol and a little HCl. It did not assume the two-band hydrochlorate spectrum of cruentine, but showed the sulphate spectrum—

1. 52 to 58 = 6
2. 61 „ 77 = 16

[Similarly a decoction with HCl of the precipitate from an alkaline solution of total cruentine (four-banded) which had been boiled during many weeks daily, showed not the two-banded hydrochlorate spectrum, but the sulphate with the narrow and wide band, the same as the foregoing. See measurements below.]

The addition of ammonia to the alcohol solution produced the *four-band cruentine spectrum.* A slight precipitate ensued in the solution which was probably an insoluble modification of the four-banded body.

Alcohol and HCl and dried two-banded cruentine.

Effect of Alcohol and Hydrochloric Acid upon dried Two-banded Cruentine.—The cruentine sulphate as before was boiled with alcohol to exhaustion, until nothing but the light red two-band cruentine, quite insoluble in alcohol on boiling, remained. This was dried and shrunk to a brownish red matter. It was slowly soluble in concentrated sulphuric acid on trituration and standing, and precipitated by water. It was also soluble in ammonia, but was partly deposited from this solution on standing by the evaporation of ammonia. (See *spectrum of deposit, below.*) It dissolved best in hydrochloric acid and alcohol, and the solution had the spectrum of cruentine sulphate.

1. 54 to 59 = 5 ; int. 1 ; R. β
2. 62 „ 79 = 17 ; „ 5 ; „ α

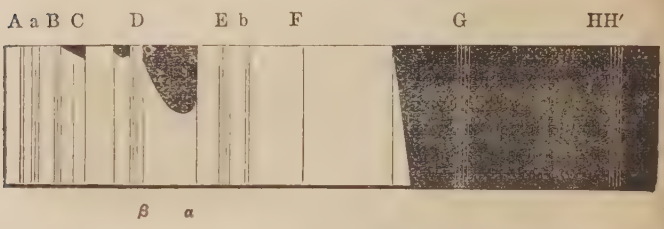


Diagram of the Spectrum of this Hydrochloric Alcohol Solution of Cruentine.

The greatest intensity of α is midway between 68 and 79, end at 142 The red is rather suddenly cut off, as if there was a band from 37 to 44 The foregoing spectrum is therefore identical with that of the hydrochloric product of cruentine described on p. 231 of Report, 1868. But there was this difference, that the solution after addition of ammoni

came *red when concentrated, green when diluted, and changed ectrum.*

1. 50 to 67 = 17; Int. 5; R. α
2. 75 „ 85 = 10; „ 1; „ β

Cut off at 110.

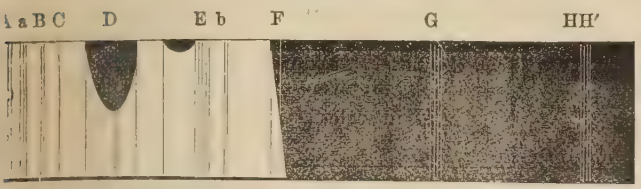

Diagram of Spectrum of Ammonia Solution of foregoing Body.

By reference forward it will be seen that this spectrum though milar to is not identical with the spectrum of two-banded cruentine ydrochlorate in water. When this latter solution is, however, made lkaline with ammonia it shows spectrum—

1. 54 to 68 = 14; Int. 5; R. α
2. 72 „ 84 = 12; „ 2; „ β

Cut off at 112.

Thus it is seen that this spectrum stands midway between the spec- um of acid watery and the ammoniacal alcohol solution.

Deposit from Ammonia Solution of Two-banded Cruentine.—This eposit, which was obtained as above described, was redissolved in con- entrated ammonia. It showed a spectrum of certainly four, possibly ve bands, distributed as follows:

Deposit from ammonia.

Band in red questionable.

1. 54 to 63 = 9; Int. 2; R. γ
2. 69 „ 77 = 8; „ 2; „ β
3. 85 „ 99 = 14; „ 3; „ α
4. 113 „ 127 = 14; „ 1; „ δ

Band No. 4 is in blue to indigo.
Cut off at 143.

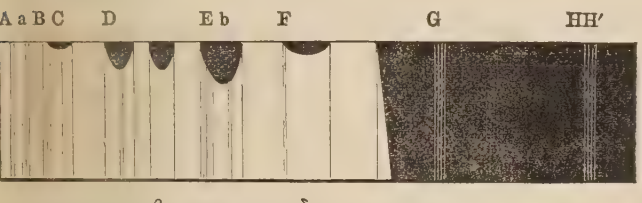

Diagram of Spectrum of Ammonia Solution of Deposit from Ammonia Solution of Two-banded Cruentine.

In case this experience should be repeated the red part of the spec- rum will have to be examined in thicker layers of fluid. The band 4 r δ is quite peculiar to this body, no band having hitherto been found o far in blue with any preparation of cruentine.

Two-banded Cruentine and Sulphuretted Hydrogen.—Cruentine was precipitated by soda from HCl solution and washed. It was then dis-

Two-banded cruentine and hydrothion.

solved in ammonia and the solution treated with hydrothion. It became very black coloured. On continued boiling it deposited all coloured matter together with black granules. Ammonia redissolved only a small portion, which had the same two bands as before. Even concentrated ammonia dissolved very little. Consequently the hydrothion had so far changed the cruentine as to make it insoluble in watery ammonia. The changed cruentine was, however, soluble in ammonia and alcohol, and formed a splendid red solution, which gave spectrum—

1. 63 to 74 = 11; int. 4; greatest on violet side; R = α.
2. 80 „ 93 = 13; „ 2; even „ = β.

Cut off in violet at 150.

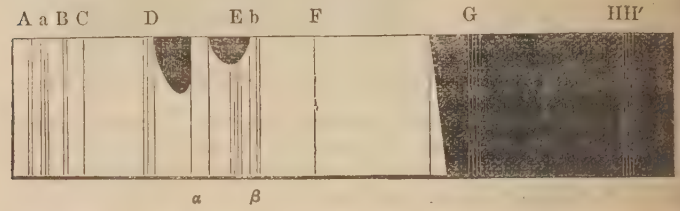

Diagram of Spectrum of Alcohol and Ammonia Solution of Two-banded Cruentine changed by Hydrothion.

On standing the dissolved matter became completely precipitated, and the alcohol almost colourless by loss of NH_3. The addition of a little NH_3 restored perfect solution. But after it had stood for one day the red matter had lost its solubility in alcohol with or without ammonia. Even boiling with these agents extracted only traces of matter, the iron had not been removed by the hydrothion. Concentrated sulphuric acid redissolved the matter and transformed it again into cruentine sulphate. This had the now well-known two bands in alcohol, but its watery solution treated with ammonia gave a precipitate, and after that was filtered off the solution showed spectrum of four-band cruentine.

Concentrated H_2SO_4 and cruentine.

Effect of concentrated Sulphuric Acid upon Cruentine.—Cruentine had been dissolved frequently in concentrated sulphuric acid, it was at last dark brown. By frequent extraction with boiling alcohol of the precipitated and washed matter a soluble portion was extracted. The insoluble portion was dissolved in NH_3, filtered, evaporated to dryness, dried, and burned, and residue determined.

0·374 grm. product from cruentine dried at 125° left 0·019 Fe_2O_3, equal to 3·5 °/₀ Fe.

Alcoholic extract.

The alcoholic extract had a peculiar spectrum:

1. A broad feeble band. 49 to 74 = 25; int. 2; R. α

Blue shaded from 78 to 112, where the spectrum is cut off.

Diagram of the Spectrum of this Alcohol Solution.

The entire spectrum is very shady, though the red solution is quite clear. On dilution the band disappears before the shading in blue, and

spectrum now reaches to 155. Diluted the red solution becomes wn; though still perfectly translucent it fluoresces with a smoky hue liffuse sunlight; in the cone of the collimator it fluoresces strongly *in te with a tinge of greenish brown.* It differs completely from the rescent cruentine formerly described which becomes *red,* and shows phenomena in a much feebler degree. The fluorescent body can in power be compared only to solution of orchil (cudbear). The alcohol , evaporated, the residue dissolved in NH_3, filtered, evaporated, and residue burned. It left red iron oxyde, which was almost insoluble HCl.

Fluorescence.

't was thus shown that cruentine cannot be deprived of iron by itment with concentrated sulphuric acid and precipitation with ter, even if continued so often that only enough material for one lysis is left. I believe that Lehmann never succeeded in obtaining natine quite free from iron by this method, and I have never succded myself. I therefore believe that the statements of Mulder arding hematine free from iron are as fallacious as his ideas regard- proteine free from sulphur. I found even that when copper s or tin salts are mixed with cruentine, these metals follow the entine through all changes, and though a little may be lost at each nge, there is always a quantity remaining in the ultimate cruentine.

Conclusions.

Hematomelanine.—Thus I term the last product of the influence of ohuric acid upon hematocrystalline and cruentine. It is purified by ation in ammonia, evaporation to dryness, and washing with water alcohol. It is a black, shining matter, and burns with fusing and lling, giving out much carbonaceous gas, which burns with ng yellow flame, greatly differing from the burning of uromelanine. eaves a residue of iron oxyde.

Hematomelanine.

Influence of Carbonate of Sodium and boiling upon Cruentine.—The le cruentine was dissolved in sodium carbonate and boiled for two s. After that it showed spectrum—

Influence of sodium carbonate and boiling.

1. in red, feeble, 40 to 51 = 11 ; Int. 1.
2. in yellow, 57 „ 71 = 14 ; „ 3.
3. in green, 76 „ 89 = 13 ; „ 5.

n darkness. More diluted the first band disappeared entirely, and e appeared band

4. 93 to 106 = 133 ; Int. 3.

earlier alcohol extracts formerly described measured in spectrum—

1. 45 to 54 ; Int. 1.
2. 63 „ 75 ; „ 3.
3. 79 „ 92 ; „ 4.
4. 98 „ 115 ; „ 3.

soda had therefore hardly changed the cruentine.

fter having been boiled daily during four weeks the spectral phenoa remained as above. It was precipitated by HCl and washed by utation, during which it began to smell disagreeably, the weather g very hot. Treated with HCl in excess only a small portion of the tance dissolved, yielding apparently the cruentine sulphate spectrum below), not the two-banded hydrochlorate. Like another specimen h, boiled with HCl, smelled of glue and gelatinised, so this smelled poiled glue. The insoluble residue easily dissolved in alcohol, ding four-band spectrum, feebly by itself, more strongly and better ed after addition of NH_3.

he circumstance that the sulphate spectrum was obtained instead of hydrochlorate caused me to examine for sulphuric acid. The solu-

tion was mixed with $BaCl_2$ and HNO_3, and allowed to stand two day when a trace of barium sulphate had deposited. But the spectrum w apparently the same as before, only the first narrow band seemed muc paler.

1. 49 to 58 = 9; Int. 1; R. β.
2. 61 „ 77 = 16; „ 5; „ α. The maximum of intensity is not the middle, but has its axis at 73. Cut off in blue at 154.

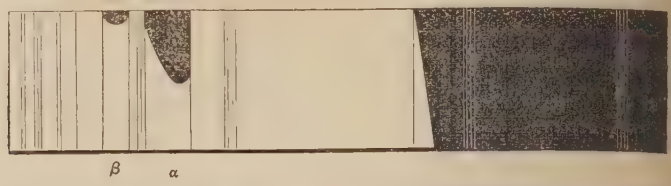

Diagram of this Spectrum of Cruentine Hydrochlorate in Alcohol.

Perhaps there is a shade, a slight indication of a band in green fro 84 to 93. Before the addition of the barium and nitric acid the HC solution measured—

1. 51 to 58 = 7; Int. 1; R. = β.
2. 61 „ 77 = 16; „ 3; „ = α.

Consequently the bands are the same in situation, but changed little in relative intensity, the difference being greatest in the solutio from which H_2SO_4 was removed. *Consequently this body is not sulphate, although its spectrum is almost identical with that of cruentin sulphate.*

Residue. The residue on filter from first HCl decoction was again treated wit HCl, and found soluble in alcohol. It had the same bands as the abov solution, but being more concentrated the whole spectrum was mor obscure. *A special obscuration in red* reached from 34 to 47. Additio of NH_3 produced the four-banded alkaline cruentine.

1. 44 to 48 = 4; Int. 1.
2. 52 „ 68 = 16; „ 3. Greatest or axis intensity of this ban at 64.
3. 71 „ 85 = 14; „ 4.
4. 88 „ 105 = 17; „ 5.

There ensued a precipitate in the solution. After filtration th spectrum was lighter, but the absorption also less intense. It is ther fore possible that both the soluble and insoluble part were four-band cruentine.

Action of soda, &c., upon cruentine. *Action of Soda, Hydrochloric Acid, and Ammonia upon Cruentine.*— The crude or total cruentine was as in the foregoing experiment boiled f weeks with soda, afterwards dissolved in hydrochloric acid and boile the insoluble part was filtered from the solution, and the latter mix with alcohol. This showed most distinctly the band in red which h been surmised to exist in the previous observation.

1. 35 to 46 = 11; Int. 2; R. α.

Shading commences at 51. More diluted there appeared—

2. 60 to 84 = 24; Int. 2.
3. 90 „ 107 = 17; „ 1. (Very difficult to determine.) End at 1 This, therefore, is the second hydrochloric acid product descri

. 232 of Rep. of 1868, but it differs in the intensity of its
ɔption.

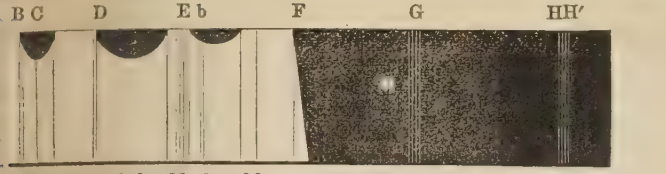

Diagram of the Hydrochlorate of Cruentine described in the foregoing.

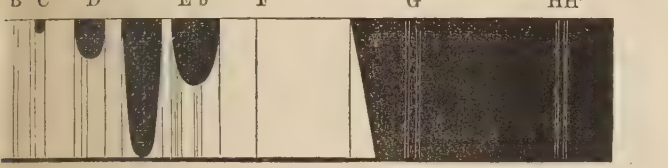
reated with excess of ammonia this body assumed the spectrum of lkaline four-band cruentine represented on p. 229 of Rep. 1868, diagram.

1. 44 to 49 = 5 ; Int. 1.
2. 53 „ 69 = 16 ; „ 2.
3. 73 „ 85 = 12 ; „ 3.
4. 89 „ 105 = 16 ; „ 3.



he part which had become precipitated in the HCl solution after lution in soda carbonate, also showed the four-band spectrum. Cruentine and nitric acid.

ruentine and Nitric Acid.—Solid cruentine as it came from the huric acid process, containing yet H_2 SO_4, was dissolved in hot nitric , and heated until no more red vapours were evolved ; it formed a ow thick solution of an aromatic smell. Addition of water precipi- d a yellowish green matter, which became darker by exposure, and nk much during drying. The dried matter was only partially soluble lcohol of 80 °/₀ ; more dissolved on boiling, and was deposited on ing. The alcoholic solution after neutralization with ammonia gave ecipitate with silver nitrate, which became darker on standing.

he precipitate by water was soluble in ammonia, and this solution Precipitate by Ag.
precipitates with Ca Cl_2 and Ba Cl_2, which were yellow, the tion remaining strongly yellow. The acid water from which the es had been precipitated was evaporated to dryness, and again mixed water. Then brown resinous drops were deposited which did not Brown semi-fluid resin.
lify on standing for some days ; consequently several bodies are formed er the influence of nitric acid. (1.) A yellow body soluble in alcohol, ocruentine. (2.) (3.) Two yellow bodies insoluble in alcohol on ing. The mixture was treated with ammonia, which dissolved one ion, namely, the body (2), or nitrocruentic acid, and left (3) nitro- rine. This on boiling with water, and repeated addition of ammonia, lled, but did not dissolve ; on attempted filtration it speedily clogged filter. (4.) Brown resinous drops. (5.) The watery acid solution aining probably oxalic acid and a yellow product. Neutralised baryta water and barium carbonate it yielded a yellow neutral ate, which on evaporation became darker every moment, and ended completely decomposed brown, hard, blistery mass. It had been ted exclusively on the steam-bath, where a higher temperature than to 95° could not be attained.

J.—*A peculiar Reaction of Cod-liver Oil, and a similar Reaction of Fatty Matter from Fibrine of Blood.*

a.) When cod-liver oil is treated with concentrated sulphuric acid immediately yields a purple reaction. The mixture cannot well be dilute with more oil, as in that case it becomes turbid, but on dilution wi concentrated sulphuric acid a beautiful purple liquid is obtained. Th when examined before the spectroscope with Drummond's light, allow red, yellow, and green to pass up to 74. On great dilution with ac the absorption recedes towards violet. When blue begins to appea green is perfectly clear. The acid solution fluoresces green, and o further dilution becomes yellowish brown.

The addition of a trace of sugar to the cod oil greatly intensifies th reaction, and causes it to remain red on dilution with acid, and n to become yellow so quickly as otherwise. This mixture yields th following spectrum :—

Band 73 to 100, when dilute. Intens. 1 ; or 73 to 110, when mo concentrated.

At the end there is a lavender coloured band up to 145, where spe trum ends.

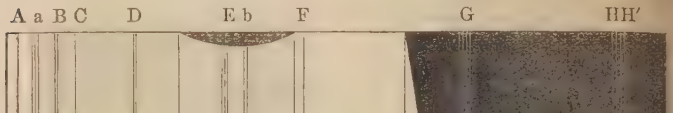


Diagram of Spectrum of Reaction of Cod-liver Oil with Sulphuric Acid and Sugar.

b.) A large quantity of fibrine which had been most carefully wash was dissolved in dilute sulphuric acid. On standing a scum collect on the top, which was washed by repeated decantation, ultimately the filter. Gradually after the last filtrates, when the paper had beco dry and the temperature of the air become high, some *fluid oil* per lated which had the following properties :—It was colourless. Wi sulphuric acid it immediately gave the red test for cerebric acid. Wi sulphuric acid and sugar it gave the purple test, and on standing t days gelatinised in a curious manner and became black. The *alcol extract* from this was red, and showed the following spectrum :—

Red, yellow, and green to 75, then dark to end.

On cautious further dilution a feeble band becomes isolated—

80 to 113 = 33. Intens. 1.

After which there is a beautiful violet band to the end at 146.

Diagram of Spectrum of Reaction of Fibrine Oil with Sulphuric Acid and Sugar, extracted by Alcohol.

More diluted absorption remains, 87 to 113 = 32. Violet gets n blue and extends to 166, when absorption disappears.

a describing the ingredients of the corpora lutea of cows, I gave ar reaction which their juice, obtained by heat, yields with sul- acid and sugar. The mixture became purple, and its spectrum a band in green.

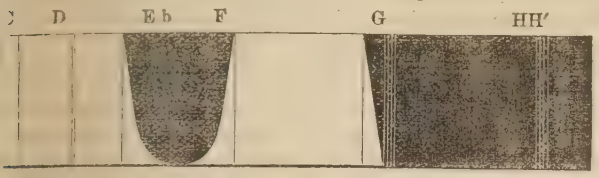

Diagram of Purple Test of Juice of Corpora Lutea.

76 to 113 = 37. Intens. 10. Cut off at 155.

liver oil gave spectrum—

73 to 110 = 37. Intens. 1. End 145.

ine oil gave spectrum—

80 to 113 = 33. Intens. 1. End at 146.

e spectra are so very similar to each other that they may be due nd the same body, which we may assume to be an ingredient of e animal liquids employed. The greatest difference is exhibited spectrum of the juice of the corpora lutea, which has an intensity while the other bodies are much less intense, remaining about 1. ay be due to the circumstance that the juice contains much more ubstance yielding the reaction than the two oils.

spectra which cod oil and fibrine oil yield when treated with ic acid only, without any sugar, give the same continuous ion in blue and violet, and are therefore identical.

olutions show a slightly green fluorescence, those with acid only nspicuously, those with sugar least. From the foregoing we may e following conclusions :—

od-liver oil, fibrine oil, and the juice of corpora lutea contain each iar substance, the particular chemical properties of which are in all three mixtures.

he colour test of these substances is apparently identical with the ich cerebric acid, lecithine, and biliary acids yield with the same s. Spectrum analysis shows, however, that the test of cerebric d lecithine with sulphuric acid alone exhibit absorption bands, ie three matters under examination do not show absorption bands he same circumstances.

ie reaction of biliary acids with sulphuric acid and sugar (Petten- test) yields a spectrum with three bands, one band overlying the (See p. 256 of last Report.) The same reaction with cerebric lds a spectrum with a band in green midway between D and E ; h the substance in the three bodies the same reaction gives a n with a band which reaches from midway between D and E to F, and which is therefore not only moved more towards the violet also much broader.

think it probable that the substance in cod-liver oil is derived e liver-cells, that in fibrine from white blood corpuscles entangled ibrine, and that in the juice of corpora lutea from the peculiar those bodies.

K.—*Chronic Yellow Atrophy of the Liver, or Malignant Jaundice*

Notes of case.

The subject of this disease was a man about 45 years of age, who h gradually become jaundiced. There was no history of gallstones, a the colour of the fæces indicated a diminution only, not a compl arrest, of the excretion of bile. The patient had fever, and w dropsical, the ascites being considerable. The liver on percussion w found much reduced; the fluid in the abdomen, however, made exact determination of its limits difficult. The first urine exami

Characters of urine.

amounted to 200 CC, and was very bilious, yielding the test for bile-ac with sulphuric acid and sugar, for cholophæine with nitric acid, and was supposed, for tyroine with nitrate of mercury containing subnitr It contained a little albumen. It was filtered and precipitated with l acetate, heated, filtered, and washed. The filtrate was evaporated small bulk and treated with alcohol. A precipitate ensued. This filtered off and washed with alcohol, and then extracted with concentra ammonia. It was then boiled with water, which extracted much mat and left a little xanthine undissolved. The solutions gave a wh precipitate with mercury nitrate, and no red colour with nitrite, t showing that tyroine was *not* present.

The solution in water was evaporated and left a colourless am phous residue. This dissolved easily in nitric acid without effervesce or red vapours, and on drying at a gentle heat a purple resi remained, which became bluish-purple with caustic potash. Con trated hydrochloric acid dissolved a portion, and crystals formed evaporation, which did not polarize, consequently were not uric a On boiling in a little water these crystals left again amorphous ma

Xanthine and hypoxanthine.

which became insoluble. We have therefore probably both *xant* and *hypoxanthine* in this water extract. The first residue, insolub water, was certainly xanthine, and the second matter may have hypoxanthine, although the circumstance that it gradually bec insoluble also points towards xanthine; for it is a well-established perty of xanthine to become more and more insoluble in water more frequently it is dissolved in or treated with it.

Volatile aromatic oil.

The reaction which simulated the presence of tyroine was prob due to the volatile aromatic oil present in every urine, and which I first described in the Hastings Prize Essay; but this must cert have been present in great excess before it could give so inten reaction. Thus far, therefore, there were only biliary matter abnormal ingredients; the other isolated bodies were normal.

The urine of the second day of observation was 630 CC, stra yellow; after filtration in bulk greenish brown. The filter rem yellowish red, as if stained by cholophæine. It was precipitated lead acetate, the filtrate treated hot with hydrothion and filtered.

Peculiar crystals.

standing 36 hours it deposited a mass of peculiar filmy cryst needles. They were isolated, the mother liquor further evaporate allowed to stand.

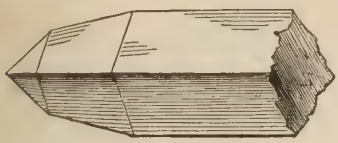
In the same manner the urine of ten consecutive days was tr and the crystals obtained were united. On examination they found to be a particular new form of uric acid, which may be

Para-uric acid.

para-uric acid. This substance is similar to xanthine by its re with nitric acid, and by the behaviour of its nitrate of silver com when dissolved in nitric acid. It is similar to hypoxanthine or s in its crystallised form, solubility in water, and deposition from h water, and in the reaction with nitric acid. But it differs from xanthine in this, that its silver nitrate compound is easily solu nitric acid, and not easily deposited on cooling, while hypoxanthine

s completely deposited. It differs from both xanthine and thine in this, that its watery hot solution, when precipitated by trate, yields a compound, which, when freed from all excess of issolves easily in nitric acid with effervescence, and deposits on cooling. After much evaporation, however, and cooling, it nitrate of silver, thus showing that in the nitric acid solution ate of silver and nitrate of para-uric acid are not combined. ture of nitrate of silver crystals and para-uric acid nitrate, after on in water, yields a copious precipitate with ammonia, which, first, contracts in excess. This is similar to both xanthine and thine. It differs from both in this, that it dissolves in dilute id under evolution of carbonic acid. The solution on evaporation purple residue. Para-uric acid differs from uric acid by its y in water, and greater solubility in hot water, forming a crystal- posit; by its peculiar shape of crystals, which are needles of mbic prisms with complicated ends, being a combination of two octahedra; and by its saturated solution in cold water on addition

chloric acid immediately depositing fine lustrous crystals, which he microscope have this shape. Para-uric acid is, however,



to ordinary uric acid by its insolubility in cold, slight solubility in concentrated hydrochloric acid; by its solubility under evolution

nic acid (and nitrogen?) in dilute nitric acid, and by the purple- l residue of this solution on evaporation to dryness.

ead precipitate after washing was suspended in alcohol and de- d by hydrothion. The filtrate was allowed to evaporate spon- ly. A greenish yellow residue remained, which was entirely n water, and against expectation did not give the nitric acid cholophæine. This substance or its derivate had therefore been hanged during the chemical process for its isolation. Biliary colouring matter.

ts.—The nitrate of mercury test applied to urine directly may tyroine when none is present. The reaction is due to the l oil. The urine in chronic malignant jaundice contains biliary and an anomalous acid of the uric acid group, to which the name uric acid has been given. It does not contain tyroine or leucine, which are often present in the acute form of the disease. Results.

L.—*On a peculiar Reaction of Lecithine from Yelks of Eggs wit Sulphuric Acid, and on primary and secondary Absorption Spectra.*

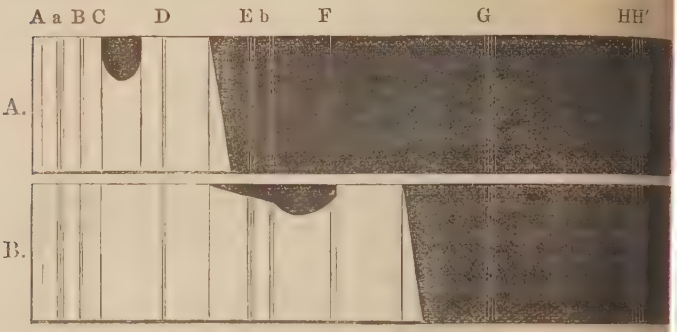
The extract of yelk of egg by chloroform or ether, after evaporation o the solvent, is a semifluid yellow mass, in which on standing fin crystals of lecithine are deposited. When it is shaken with concentrate acetic acid much luteine dissolves, and oily drops remain suspende But none of the substances can at present be perfectly isolated. Treate with concentrated sulphuric acid it gives a blue reaction, due t luteine, which passes into green and then into red ; this becomes dark every moment and shows spectrum :

Band in red and orange 40 to 53 = 13 ; intens. 3 ; R. α. In very dar solution the band reads 42 to 56. Yellow from 59 appears green an shaded to 71, where spectrum is cut off. The solution has a powerfu green fluorescence.

On dilution blue appears at 114, reaching to 139, and in green a ban remains, feeble from 74, becoming intensity 3 at 95, and ending at 114

1. 40 to 53 = 13 ; Intens. 3 ; R. α.
2. 74 „ 114 = 40 ; „ 2 ; „ β.

When 2 can be seen and measured, 1 has quite disappeared. Th first spectrum is therefore the primary (A.), and the last one the seconda (B.) spectrum.



Diagrams of Primary and Secondary Spectrum of Lecithine fro Yelk of Eggs with Sulphuric Acid.

The spectrum A. has already been described and figured on p. 18 the 10th Report of the Medical Officer, but is there erroneously nam as that of vitelline. It is, however, correctly alluded to under proper name in the comparison with the biliary tests on p. 256.

1. *A new Mode of purifying Leucine.*

study of the chemical and dynamical relations of this substance eat importance, as it is not only a normal ingredient of some f the animal body, but a constant and copious product of the and artificial decomposition of albuminous substances. In gical conditions of the human body it appears in various organs, arly the liver, and then it is also not rarely excreted by the urine. iant jaundice.) The circumstance that it is a homologue of ll, (the normal copula of cholic acid in glycocholic acid of the d of benzoic acid in the hippuric acid of the urine,) invests it eat theoretical interest. Some time ago I undertook an inquiry ne of its transformations, an account of which has been published Journal of the Chemical Society. The production of an acid m nitrogen, and more oxydised than caproic acid, and of many alts, was the principal result of that inquiry. This leucic acid (C_3) was shown to be homologous to lactic acid ($C_3H_6O_3$), as nology of leucine to glycocoll led the inquirer to suppose. But t difficulty in procuring leucine in quantity prevented an extension research over a greater area. This has now been overcome to a xtent by the following new proceeding.

Process.

raw leucine, as obtained by the inspissation and cooling of the liquors of tyroine, freed from mother liquor by pressure and s treated with concentrated nitric acid while being triturated in a and gently heated, until a slight reaction is perceived. The cid solution is then diluted with water, and a solution of nitrate le of mercury is added as long as a precipitate is thereby pro- This is removed by filtration. The filtrate is allowed to stand e days, during which time a reduction of mercury takes place. cess of mercury is then removed by sulphuretted hydrogen. The is neutralized by ammonia and evaporated until a pellicle forms. icine which is separated on cooling is collected on a filter, washed ncentrated alcohol until the filtrate is colourless, and dried. It is ssolved in boiling water, treated with pure animal charcoal, and ; the filtrate is evaporated in a covered china capsule (a Berlin in capsule with wooden handle and spout and china cover is best t purpose) until it is saturated on boiling, (forms a pellicle imme-

diately on the cover being removed,) and then poured into three or fo times its volume of very strong alcohol. White leucine crystallis almost immediately, and on standing. After 24 hours the leucine collected on the filter, washed with alcohol, and dried on blotting pape If it is not perfectly white and brilliant and free from smell, it must dissolved once more in boiling water filtered, and after concentrati poured into alcohol.

Thus purified leucine is a matter of a very light specific gravit owing to the excessive thinness of the scales; it is perfectly white a of great splendour; it can be sublimated in white flakes without leavi any residue; in short all possible chemical tests show it to be perfect pure.

In this manner I have purified leucine obtained from horn; fro human and other hair; from albumen; from fibrine; from the huma liver in several diseases—paralysis and Bright's disease, pyæmia, a tetanus; from the human spleen and kidneys in pyæmia and tetanu and from liver substance which was allowed to putrefy in a vessel fro which air was excluded.

2. *On the Compounds of Leucine and Copper.*

Preliminary remarks.

a. Preliminary Remarks.—It is desirable to possess means by whi leucine can be completely removed or precipitated from solutions in su a manner as not to interfere with their further analysis. When we consid the compounds of leucine hitherto known, it is clear that none of the offers the necessary conditions for the accomplishment of this obje

Leucine and cupric hydroxyde.

The researches of Goessmann (Ann. Chem. 91, 133) had shown th copper oxyde readily combined with leucine, and formed a compound slight solubility. But as for complete precipitation an excess of t oxyde would have to be used, it was to be apprehended that the co per compound obtained must contain an admixture of basic salt, or uncombined oxyde, and could therefore not be analysed directly, b had to be re-formed into a compound of definite proportions. It h been stated by Strecker that leucine displaced the acid of copper aceta and formed an insoluble compound with the metal. To the applicati of this reaction there was the objection that it imported acetic acid i fluids which may contain this or nearly allied acids as essential ing dients. I therefore endeavoured to find a process which should combi all leucine contained in any fluid at once with an invariable quantity copper, without leaving any excess of copper or any other acid in t fluid, and should subsequently yield the leucine copper compound in insoluble form ready for analysis. This was effected by the follow proceeding.

Leucine and cupric acetate.

Mode of obtaining new compound.

b. Mode of obtaining new Copper Compound of Leucine, or Dicup Trileucine.—On adding to a solution of leucine cautiously a conc trated solution of copper sulphate, until caustic potash produce precipitate in a filtered sample of the cold solution, a fluid of a d blue colour is obtained. This is treated with barium carbonate boiled until an excess of this earth does not any longer ca effervescence, and a filtered sample of the solution remains clear w barium chloride and nitric acid. The filtrate, a fluid of a beautiful d blue colour, is free from sulphuric acid, contains a quantity of coppe solution which stands in a certain proportion to the amount of leu present, and on evaporation on the water bath at a gentle heat standing and cooling deposits a light blue mass of crystalline gran The new compound after being washed with water for some time is t washed with alcohol until the washings are colourless, and dried sulphuric acid. It is a pale blue granular mass and becomes sky-

Properties of new product.

ing powdered. It leaves copper oxyde on combustion. When d in a glass tube open at both ends it emits white and alkaline fumes e strong and characteristic odour of amylamine. When the com- d is boiled with water little only dissolves. Its mother liquor orated to dryness, and again treated with water to the extent of the nal solution, deposits a further mass of scales and crusts, which are nearly insoluble in even boiling water. Thus almost the entire int of leucine contained in the fluid is obtained in the form of this uble copper-compound.

nalyses.—Dried in the steam-closet until the weight was constant— Analyses.
0·345 grm. gradually ignited gave 0·1044 grm. of copper oxyde, l to 0·0833 of Cu, or 24·14 °/₀ of copper in the compound.

0·2946 ignited gave 0·091 CuO, equal to 0·0726 Cu, or 24·64 °/₀.

0·5248, burned with soda-lime, gave out ammonia, which com- l with 0·3036 grm. of platinum, &c., and therefore contained 357 grm. of nitrogen, or 8·30 °/₀.

cond Mode of obtaining.—The same compound was obtained by Second mode of obtaining.
ng a solution of leucine with bright copper wire newly reduced in ogen, for some days on the sand bath. The salt was deposited from olution filtered boiling; the solution retained little copper, and ined excess of leucine. The compound was therefore soluble in a ion of leucine, but much less soluble in water. It was insoluble in g acetic acid. The analysis gave the following result:—

0·0785 grm. left 0·0240 CuO, equal to 24·42 °/₀ Cu.

hird Mode of obtaining.—The same compound was obtained by Third mode of obtaining.
ng copper oxyde to a solution of leucine hydrochlorate. This riment will be more fully described lower down.

0·0912 grm. left 0·0270 grm. CuO, equal to 23·64 °/₀ Cu.

ourth Mode of obtaining.—By evaporation of the mother liquor of Fourth mode of obtaining.
cupric dileucine obtained by copper acetate (see lower down).

0·6339 left 0·1840 grm. CuO, equal to 23·17 °/₀ of Cu.

ie compound obtained by the four processes described consists of atoms of leucine, in which four atoms of hydrogen are substituted wo atoms of copper.

s formula is $C_{18}H_{35}Cu_2N_3O_6$. Formula.

Synopsis of analyses.

compound, therefore, stands midways between the neutral salt $H_{21}CuN_2O_4$, requiring 19·6 °/₀ of Cu and a hypothetical ie monoleucine $C_6H_{11}CuNO_2$, demanding in theory 32·95 °/₀ u.

he mixture of leucine and copper sulphate assumes a deep blue Deep blue colour of leucine and copper sulphate mixture.
ur immediately on the addition of the sulphate. The colour is er than that of the saturated copper sulphate solution, even when a few drops of it are added to a saturated leucine solution, which if

Spectral analysis of blue solution.

they were added to the same bulk of water would be scarcely sufficient impart to it any blue tint whatever. The amido-acid in the sulph therefore increases the colour of the copper salt analogous to ammon The removal of the sulphuric acid and excess of copper oxyde by bari carbonate leaves the solution still darker.

Both solutions examined in the spectroscope absorb one half of red part of the spectrum. The yellow and orange become green, green dark, the blue lighter, but no detached absorption bands are cernible with lamp-light. The salts therefore behave like inorga copper-salts.

(*f.*) *Application of the Method to the Separation of Leucine from Extract of a Liver suspected to contain Leucine.*

Separation of leucine from liver.

The liver was extracted with boiling water, the extract treated w lead acetate, the filtrate freed from lead by hydrothion, and evapora to crystallisation. The mother liquor was separated, the residue trea with spirit, the spirit extract dried, dissolved in water, and satura with copper oxyde by the addition of cupric sulphate and boiling w barium carbonate. A deep blue solution resulted, in which on evapo tion some reduction of copper took place. The insoluble greenish b leucine-copper was separated and washed, dried at 110°, and analyse

(*a.*) 1·4703 grm. burned in platinum crucible left 0·4284 grm. cop oxyde, or 23·26 °/₀ of Cu.

(*b.*) 0·7171 grm. burned in platinum crucible left 0·2077 CuO, 23·12 °/₀ Cu.

(*c.*) 0·6614 grm. burned in china capsule gave 0·1899 CuO, 22·92°/₀ of Cu.

The mean of these analyses is 23·10 °/₀ of Cu, and differs from mean found in the pure preparation by 1·2 °/₀, from theory by 1·4 This difference is, however, unimportant, as the data still support theory, and because the difference is fully accounted for by the sli deoxydation and consequent separation in the form of pulverul suboxyde of copper which a minute portion of the dissolved cop oxyde experienced. In a similar case it would be necessary to al the oxydisable matter to saturate itself with oxygen from copper, then to saturate the leucine, which has been deprived of a portion of copper, a second time with copper oxyde. This may be done in all c where a very pure preparation is desired at once, and a considera loss of leucine by the earlier precipitation of the compound is secondary importance. It is best to employ copper oxyde which been kept under water and become finely pulverulent and reddish bl In some cases a few drops of a solution of copper acetate may be s cient to restore the deoxydised copper.

To impure extracts of organs which contain much undefined disable matter the method is as yet not well applicable. The pro obtained is green and very impure. Nevertheless, from some extr of cholera organs which had been analysed for urea some scales of co leucine could be extracted which admitted of perfect identification.

(*g.*) *Monocupric Dileucine, obtained by means of Copper Aceta*

Leucine copper made by adding copper acetate to a hot solution of leucine.

On adding to a concentrated hot solution of leucine kept on the st bath a quantity of saturated solution of copper acetate, the fluid bec for a moment deep blue, and then immediately deposits a light gra precipitate. This increases by stirring, and the fluid is decolo The continued addition of copper acetate brings the precipitate

ximum, and the fluid then remains of a more saturated blue. Thin les form on the surface. They are decanted with the blue fluid from precipitate, and the latter is placed on a filter. The washings are y faintly blue, lastly almost colourless. To boiling water the pre- ipitate yields a portion of matter (monocupric trileucine and dicupric eucine), which will be considered lower down. Dried at 110° until stant, it is a beautiful sky-blue powder with no particular lustre.

Analyses :—

a.) 0·6353 grm. burned in a china crucible left 0·1490 grm. CuO, ual to 18·72 °/₀ Cu.

b.) 0·6511 grm. left 0·1536 grm. CuO, equal to 18·85 °/₀ Cu.

c.) 0·3492 grm. burned with lead chromate gave 0·5604 CO_2 and 2601 H_2O, equal to 43·77 °/₀ C and 8·27 °/₀ H.

From a comparison of the above analyses with the theory of ydrous monocupric dileucine (atom. weight, 323·4),

Atoms.	Atomic weight.	In 100.	Found.			
			a.	b.	c.	Mean.
C_{12}	144	44·52	„	„	43·77	„
H_{24}	24	7·42	„	„	8·27	„
Cu	63·4	19·60	18·27	18·83	„	18·55

vill be seen that the carbon and hydrogen analyses support the theory he anhydrous compound, containing in theory 2·4 °/₀ C more than the drated, better than that of the hydrated, stated below, while the per meets the requirements of the hydrated salt. But as four erent preparations hereafter to be described support the probability his salt being always hydrated, the above salt may be assumed also contain one atom of water.

The solution from which the foregoing compound had been deposited, evaporation formed scales on its surface which resembled those of upric trileucine as obtained by the barium process. The fluid when wed to cool became turbid. The washed precipitate after extraction h boiling water was analysed. 0·6339 grm. left 0·1840 grm. CuO, al to 23·17 °/₀ Cu, or exactly the mean found in the compound n the liver extract (23·10 °/₀).

) *Hydrated Monocupric Dileucine, obtained by saturating a boiling Solution of Leucine with Cupric Hydroxyde.*

Goessmann (Ann. Chem. 91, 133) obtained a compound of leucine copper, by saturating a solution of the former, while boiling, with drated copper oxyde, and cautiously concentrating the solution on water bath. On cooling a granular crystalline dark blue compound embling oxyde of copper ammonia was deposited. When the solu- n was concentrated quickly the compound was deposited in scales on surface and at the bottom of the fluid. The crystalline deposit and scales were analysed together, and yielded the following numbers. e matter was dried at 100° C. The copper was found so low as to tify the assumption of the compound having been a hydrate. But hydrogen was one per cent. below the theoretical quantity, and as l be seen from a comparison with the theory of the anhydrous salt, s actually 0·7 °/₀ below the theory of this latter. On the other nd, the carbon should have been rather higher, if the compound had n partially dehydrated. I once obtained a compound with a similar

amount of copper (18·62 °/₀), by treating a large quantity of leucin dissolved in weak spirit with some copper oxyde and metallic copper.

Theory of hydrated monocupric dileucine. Atomic weight = 341·4

		In 100.	Goessmann.	Th.	Mean of compo by Cu acetat

Cu	63·4	18·56	18·20	18·62	18·55

(*i.*) *Dicupric Trileucine and Monocupric Dileucine obtained from Leucine Hydrochlorate by repeated addition of Copper Oxyde.*

The solution which remained after the mercury of some mercuric leucin had been precipitated by H_2S out of its HCl solution, was evaporate to dryness to chase away all excess of HCl, then redissolved, and whil hot treated with cupric hydroxyde. An insoluble blue compoun (No. 1) immediately formed. Analysis, 0·0912 grm. burned lef 0·0270 grm. of copper oxyde, equal to 23·64 °/₀ Cu.

The solution was evaporated to dryness on the water bath, and yielde a blue compound (No. 2) covered by a thin layer of green. The latter copper chloride, easily dissolved in water with a blue colour, while th blue compound remained undissolved. Dried at 110°. Analysis 0·1986 grm. burned left 0·0452 CuO, equal to 18·17 °/₀ Cu.

The mother liquor or washings of the foregoing compound were heated and treated a second time with copper oxyde; this at first dis solved, but the clear solution began to get turbid and a new quantity o precipitate (No. 3) fell down.

Analysis: 0·1852 grm. left 0·0420 CuO, or 18·11 °/₀ Cu.

The filtrate from this was now saturated with copper oxyde, filtered from the excess, and the blue filtrate evaporated on the water bath. It deposited sky-blue granules (No 4) besides green copper chloride. The latter was removed by washing with water.

Analysis: 0·2318 grm. left 0·0532 CuO, equal to 18·33 °/₀ Cu.

The filtrates were again evaporated, and deposited a salt (No. 5 which was analysed.

Analysis: 0·1067 grm. left 0·0248 grm. CuO, equal to 18·56 °/₀ Cu.

All the precipitates were washed until the washings were free from chlorine. The precipitates were then specially analysed for chlorine but found not to contain any. The copper oxyde thus separated the leucine from the hydrochloric acid, forming at first and only once dicupric trileucine, afterwards under varying conditions four times mono cupric dileucine. In each preparation copper chloride was found an observed to diminish until the last. It is therefore evident that leucin when evaporated with copper chloride in proper proportions drives ou the hydrochloric acid almost as easily as the acetic acid from th acetates of copper and mercury.

Fluorescence of washings of the above solutions.

The latest washings from the above compounds were clear an colourless in transmitted light, even in thick layers. But they fluoresce copper blue in diffuse light, and strongly whitish blue in sunligh Sunlight thrown into the fluid with a lens produced an intense whit blue pencil of fluorescence.

Synopsis of the quantity °/₀ of Cu found in the compounds :—

No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
23·64.	18·17.	18·11.	18·33.	18·56.

The last preparation thus contained exactly the amount of copper quired by the hydrated monocupric dileucine.

(*k.*) *Monocupric Trileucine.*—C_{18} H_{37} CuN_3O_6.—When the first nular precipitate, which is produced by copper acetate in a hot ution of leucine, is after complete washing with cold water boiled in arge quantity of water, a small quantity of two compounds dissolves, which the one is deposited from the filtrate on cooling in light rstalline clouds; the other remains in solution. Under the microscope deposit appears as rosettes of scales, belonging to the rhombic tem apparently. But the angles of the scales are very uncertain. ashed and dried they form an exceedingly light mass, of the peculiar tre of leucine itself, having also its fatty feel, but in addition a splendid t light sky-blue colour. The masses are so highly electric that they here to paper or a knife like needles to a magnet.

Analysis: 0·1515 grm. on combustion left 0·0273 CuO, equal to ·38 °/₀ Cu.

Theory of monocupric trileucine :—

		Calc. in 100.	Found.
C_{18}	216	,,	,,
H_{37}	37	,,	,,
Cu	63·4	13·95	14·38
N_3	42		
O_6	96		
	454·4		

The mother liquor from which the foregoing compound had been posited measured 358 C.C., had a faint blue colour, and on evaporation dryness left a quantity of salt, which dried at 110° C. weighed 1012 grm. On combustion it left 0·0283 grm. CuO, equal to ·29 °/₀ Cu. and was therefore dicupric trileucine.

A precipitate was therefore formed by the copper acetate in the cine solution, which consisted mainly of *monocupric dileucine*. From s boiling water extracted *monocupric trileucine*, which was deposited cooling of the water, and *dicupric trileucine*, which was left pure er the evaporation of the fluid. It is possible that the latter two lies were originally formed and mixed with the first compound. It y, however, also be supposed that monocupric dileucine is decom- sable by boiling at a certain period after its formation, and in small antity, and that three atoms of it break up according to the following mula :—

(L = leucine.)

$$\left\{\begin{matrix}L\,L\\Cu\end{matrix}\right\}\quad\left\{\begin{matrix}L\,L\\Cu\end{matrix}\right\}\quad\left\{\begin{matrix}L\,L\\Cu\end{matrix}\right\} = \left\{\begin{matrix}L\,L\,L\\Cu\end{matrix}\right\} + \left\{\begin{matrix}L\,L\,L\\CuCu\end{matrix}\right\}$$

3 atoms monocupric dileucine.	1 atom monocupric trileucine.	1 atom dicupric trileucine.
Cu = 18·56 °/₀.	Cu = 13·95 °/₀	Cu = 24·58 °/₀

3. *On a new Compound of Leucine and Mercury, Pentamercuric Hexaleucine.*

The neutral compound $C_{12}H_{24}HgN_2O_4$ is made by dissolving h a quantity of freshly precipitated mercury oxyde in a hot solution

of leucine, that on cooling a turbidity ensues in the fluid. This solution on evaporation deposits the above salt. But when it was attempted to obtain this compound by acetate, as in the analogous case of the copper-compound, a new salt was obtained.

To a hot solution of leucine a concentrated neutral solution of mercury acetate was given, and the mixture heated gently. A white granular precipitate ensued, which was separated by the filter from the hot fluid. (First precipitate.) The mother liquor was evaporated by steam to a concentrated state, when much acetic acid escaped, but no deposit ensued. The addition of water produced an immediate white, slightly pink precipitate. The acid compound was evidently decomposed by water. The precipitate was filtered off and washed. (Second precipitate.) The washing water made the filtrates again turbid.

First Precipitate, or Pentamercuric Hexaleucine.—The precipitate was washed, then suspended in hot water, boiled, filtered, and again washed. The filtrate contained a mercurial leucine compound. The precipitate was a slightly yellowish heavy powder. It was dried at 110° C.

Analysis : 4·2527 grm. were dissolved in dilute hydrochloric acid. A small quantity of yellowish impurity was removed by filtration, and the filter washed to exhaustion. The application of hydrothion yielded 2·8167 grm. of mercury sulphide, equal to 57·09 °/₀ Hg. This leads to $C_{36}H_{69}Hg_5N_6O_{12}$, as the formula of this compound, being *pentamercuric hexaleucine.*

Hg	Hg	Hg	Hg	Hg
L L	L	L	L	L
Atoms.	At. Wt. in 100.		Found.

Introduction.

Introduction

The following researches arose in an endeavour to define chemically spectrologically the substance which passes in works on morbid tomy and chemistry under the name of "hematoidine." In this leavour the author was completely disappointed, as during the mination of more than 1,200 different specimens of healthy or morbid ues "hematoidine" was never once met with. The author does not, refore, assume that hematoidine, as originally described by Virchow, s not exist. He believes, however, that several matters have oneously been termed hematoidine, which were either cholophaine luteine. Neither of these last two bodies have any apparent rela- or similarity to hematoidine, or to any of the numerous derivates the colouring matter of the blood which have been described in the th Report of the Medical Officer. Luteine in particular offered perties so peculiar, that it was specially investigated, and there was nd such a wide distribution of it, or of bodies very closely resembling that the subject was followed out as far as time and opportunity mitted. The whole of the new substances met with were, according their spectra, and with regard to their origin and occurrence, ided into 10 classes. Of these only one class, namely, yellow stances with continued absorptions, have hitherto (as far as author's acquaintance with literature reaches) been known to nce; the spectra (and most of the bodies to which they belong)

* An abstract of these researches was communicated to the Royal Society by the ical Officer, and was published on p. 253 et seq. of No. 108, vol. 17, of the ceedings of that Society. An abstract also appeared in the Centralblatt für die dizinischen Wissenschaften, January 1869.

of the other nine classes are here described for the first time. These researches show that specific absorption-phenomena are not, as has hitherto been believed, confined to the red, yellow, and green part of the spectrum, but occur, if not in the same variety, yet with the same or perhaps greater frequency in the blue, indigo, and violet part of the spectra, particularly of substances which present to the naked eye a yellow or orange colour.

The animal series of these substances claims particular consideration, on account of the important physiological and pathological questions which they concern: questions, for instance, as to the homologies of parts of the ovum, and as to the chemistry of the blood serum, and as to intestinal digestion, and as to the pathology of ovarian tumors, and generally as to cell-growth and secretion.

The spectroscopical observations were made with the methods and instruments which are described and figured by the author in previous reports, and which, for readiness and precision, he can strongly recommend to the attention of spectroscopical inquirers. To the author, at least, the spectroscope has become one of the most indispensable aids of inquiry in the laboratory. The diagnoses which it is capable of establishing between bodies of similar colours, or between bodies which by chemical reaction assume or yield similar colours, are striking and certain, and cannot be furnished so readily by any other mode of inquiry.

a.

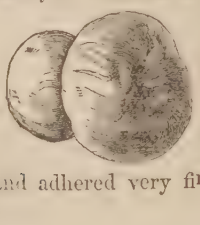
On Ovario-luteine, the characteristic Yellow Ingredient of the Corpora Lutea of Mammals.

Corpora from ovaries.

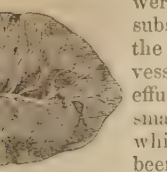
The ovaries of cows and heifers were dissected, and corpora lutea from the size of a large filbert to that of a lentil removed. The large corpora had all what may be called a cap or a projection protruding over the round surface of the ovary. The larger they were the lighter was their colour. The large ones were yellow to orange, the small ones became red like cinnabar. Some came easily out of the tissue of the ovary, being attached only loosely by connective tissue; scraping rather than cutting was required to isolate them. Some contained a cavity filled with a clear yellow fluid. In one instance I removed this fluid with a pipette, and found it to measure about 3 cubic centimetres. A few minutes after its removal from the cavity it became firmly coagulated. The corpus was of equal thickness all round, the inner surface pale, white, and smooth, with many threads extended from wall to wall. There was no aperture in the corpus, which therefore represented a complete cyst. Other corpora came out of the ovaries with no less ease; but they were smaller and more solid to the touch, and contained a small cavity of the size of a pea, filled with yellowish coagulating fluid. The greater number of corpora, however, contained no cavity, but were quite solid, and in the place where a cavity might have been, and in my opinion was at an earlier stage of their growth they showed stripes and streaks of white fibrous tissue. These corpora rarely had any protuberance. Smaller corpora were of darker colour and adhered very firmly to the tissue of the ovary, drawing its sur

'avity of corpus filled with fibrinous fluid.

Solid corpora.



Small corpora.



wards after the fashion of an umbilicus. The smallest corpora were dark red, and frequently quite buried in the substance of the ovary. The corpora, particularly the large ones, were surrounded by many blood-vessels, but in none of them was there ever seen effused blood, or coagulated blood, even to the smallest extent, or any residue or appearance which could have led to the belief that there had been at one time an effusion into its cavity, or near to

phery. No crystals of any kind, particularly no so-called No blood or
line crystals, were ever met with. Microscopically the corpora crystals found.

lutea, while fresh and large, consisted of many Microscope

Turbidity by water.

The addition of a little water or of any watery reagent to the satur alcohol solution caused a turbidity which did not dissolve on heat The potash mixture alone became clear and formed a yellow dep Platinum tetrachloride, gold terchloride, and mercury perchloride duced no reaction, even on boiling. Neutral mercury nitrate cause

Reactions with mercury nitrate and acetate.

copious yellow precipitate, which on heating immediately, slower standing, became snowy white. Mercury acetate produced a cop canary-yellow precipitate, which on boiling contracted, and left fluid colourless.

Reactions with acetates of copper, zinc, and lead.

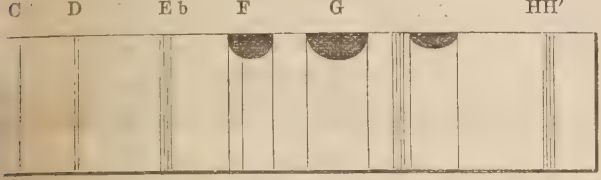
Copper acetate produced a copious green precipitate, which bec thicker on boiling, but the fluid remained turbid for days. The acet of zinc and lead apparently produced no reaction at first, even on boil but on standing some days the mixture deposited all yellow matte an oil at the bottom of the alcoholic solution. A solution of io in ammonium iodide produced no reaction.

Chloroform solution of luteine. Spectrum.

Chloroform extracted the yellow matter both from the fresh corpora and from the dry powder. The solution left the spectrum to 85, when the blue was cut off. On continued dilution blue appe but there remained an absorption band, 93 to 110 = 17, int. 2, with gas-light. Drummond's light gave same measurement. On cautious dilution a second absorption band, 119 to 136 = 17, i R. β, could be observed; spectrum cut off at 175. Other readin medium concentrated solution:—

(1.) 90 to 100 = 20.
(2.) 116 „ 137 = 21.
Cut off at 189.

pared to the spectrum of the alcoholic solution, the bands of the orm solution were moved from 12 to 16 points of the scale s the red end, and the third band was not certainly visible.
ether solution, on the other hand, of which spectrum is here ed, resembles the alcohol solution, its second and third bands noved a little more towards the violet end.



chloroform solution evaporated before the bellows left a , which was white at first, ultimately yellow. This residue drop of nitric acid became blue for a moment, then colourless. hloroform solution with nitric acid became colourless at once it any blue appearing. The very peculiar odour of luteine which ed most strongly during the evaporation of the chloroform, led me much of the odour of cancer juice. The yellow residue t dissolve easily in cold alcohol, but required heating. By con- ted sulphuric acid it was coloured of a dirty green, which at the n in the thinnest layers appeared blue. When a little sugar was to the solution no purple appeared, from which it became pro- that the reaction of the juice above described belongs to a matter ing luteine.

Reactions of luteine with nitric and sulphuric acid

Odour like cancer juice.

en the alcohol solution is left to spontaneous evaporation, a semi- fat-like matter remains, in which on standing crystals are ted, while the fat loses nearly all its colour. The crystals are red in transmitted light. They can but imperfectly be isolated the semi-fluid fat in the following manner :—The mixture is edly shaken with absolute alcohol, in which the fat dissolves to a extent, while the crystals are almost insoluble in it. What ns after decantation of the alcohol is repeatedly shaken with portions of ether. The rest of the fatty matter now dissolves, he crystals remain free, although deadened in appearance and led by the ether, which dissolves a portion of their substance. rystals are washed on a filter with a little ether, pressed between , and dried.

Crystals of luteine.

e crystals are soluble in chloroform with a yellow, in a concentrated fiery orange, colour ; in absolute ether with a yellow colour, less than in chloroform ; in sulphide of carbon with a fiery red colour, by dilution becomes orange yellow. Glacial acetic acid dis- the crystals on heating only. Dilute acetic acid, dilute mineral ammonia, caustic soda, do not dissolve the crystals. Nitric acid d over the crystals produces a blue colour, which immediately

Reactions of the crystals.

passes into yellow. When dilute or concentrated nitric acid is add to the solution of the crystals in acetic acid, the blue colour is al produced, but disappears immediately. Neither the chloroform nor t ether or alcohol solution give any blue colour with nitric acid; t solutions are simply discoloured.

b.

Oxo-luteine, the characteristic Yellow Ingredient of the Yelks o Hens' Eggs.

Chloroform extract.

Yelks of hens' eggs were shaken with chloroform. On standing yellow solution settled, on which white vitelline floated. The soluti assumed to be saturated, had spectrum of three bands in blue, indi and violet.

1. 99 to 117 = 18 ; int. 2. R. α.
2. 125 „ 145 = 20 ; „ 2. „ β.
3. 155 „ 174 = 19 ; „ 1. „ γ.

End at 190.

Diluted with one-third volume of chloroform the solution show spectrum—

1. 103 to 117 = 14 ; int. 2.
2. 126 „ 144 = 18 ; „ 2.
3. 159 „ 173 very feeble.

End at 196.

Again observed after standing 24 hours—

1. 103 to 117.
2. 126 „ 144.
3. 158 „ 172.

End at 200.

This solution shows the bands very well, and better than any of following solutions in ether or alcohol. It is necessary to obtain solution very brilliant by letting it stand, and filtering and decanting repeatedly from deposits of aqueous matter.

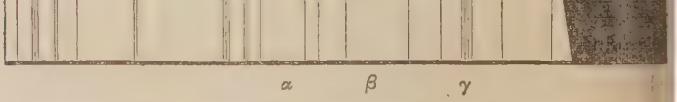


Diagram of Spectrum of Luteine from Yelk of Egg in Chlorofo

Ether extract.

The *ether solution* of the extract from yelk has a splendid ye colour. In its saturated state one centimetre thickness cuts off spectrum at 100 nearly. Much diluted there appears spectrum bands—

1. 108 to 125 = 17; int. 2. R. α.
2. 134 „ 155 = 21; „ 2. „ β.
3. 168 „ 184 = 18; „ 1. „ γ.

There is no doubt that if all spectra could be measured at one the same time, and with one and the same intensity of light, the cidence of the data would yet be greater than it is. Upon a compa of all the data, and taking into consideration the chemical reac above described, we are justified in assuming that:—1. The spect the various extracts from the corpora lutea are identical with tho the several extracts from hens' eggs. 2. A fortiori the body prod the spectra in the extracts from the corpora is chemically identical that producing the spectra in the extracts from yelks. 3. This bo a yellow crystallizable substance which has not hitherto been defin which I attribute the name of luteine.

This body has, however, repeatedly engaged the attention of inqu Thus Holm, under the guidance of Städeler, isolated it, and desc

References to literature. Diagnosis from hematoidine.

nann's Journal, vol. 100, p. 142) most of its properties, excepting ectroscopical ones, but believed it to be hematoidine. But *luteine* entirely from *hematoidine*. Luteine is the specific physiological ct of a certain normal cell-formation which builds up the corpora

Hematoidine is an abnormal product of pathological processes, or events an accidental formation derived from effused blood out of the of vital action. Luteine is deposited in granules within cells, a ct of their chemical life; hematoidine is deposited in crystals and lar masses in the midst of effused and decomposing blood. The idea he yellow or red matter of the corpora lutea was hematoidine origi- from the circumstance that corpora lutea sometimes, in a few animals as sows, and sometimes in women who have died of disease, contain vasated blood in their centre, and in this a few crystals of hema- ie. This blood is a pathological formation, or if not, at all events normal one. For in the hundreds of ovaries from cows, sheep, or animals which I have dissected, I have only twice found any effused in the corpora lutea, and only once in any other part of the ovaries the arteries and veins. Bischoff (Entwicklungsgeschichte der ethiere, p. 32, et seq.) gives a description of the corpora lutea to I assent in all its features. He says nothing of the bloodclot has latterly been so often alluded to in relation to hematoidine, which has actually been figured by Henle (Anatomie des Menschen, II. p. 478, fig. 372, ref. 5) as situated in the cavity or in the of the corpus luteum, already approaching its natural greatest However often such abnormal products may have been observed hers, the hematoidine crystals contained in the interior of these ovarian apoplectic effusions are things which are quite different the granular luteine contained in the cells of the corpora even of those corpora lutea which may contain such a sangui- effusion, though they may be lying side by side. Still less bility has now the view originally propounded by Paterson (Edinb. and Surg. J., Vol. 53, No. 142, 1840, p. 1, and No. 45, p. 390), the corpus luteum was the product of the transformation of an on of blood between the two layers of the Graafian follicle. The s luteum is a new growth from the membrana granulosa of the e, in the formation of which extravasated blood has no share, and evelopment of which it could only impede. Städeler (Erdmann's ., Vol. 100, p. 148) investigated the nature of the yellow matter yelks of eggs, probably in connexion with the studies of Holm. d not obtain a crystallized body, and came to the conclusion that ellow matter was either hematoidine (such as Holm had defined it), me very nearly related body. The spectral phenomena of the cts from yelk did not engage his attention.

teine has no chemical or physical relation to hematoidine, or any derivate of hematocrystalline. The latter when treated with uric acid all yield cruentine, with a variety of modifications, and lar absorption spectra, several of which I described in the last Report. ne becomes blue, then green, with sulphuric acid, and then shows ectrum at all like anything obtained from blood. Luteine has its ption bands in blue, indigo, and violet, while all derivates of hema- talline have their absorption bands in red, yellow, and green, tine alone just leading with its last band into blue. The hematine is of hematocrystalline is very difficult to destroy by chemical s, and even strong reagents produce changes so to say only upon its ce. Luteine is easily and permanently altered by the same agents. c acid transforms all relations or derivates of hematocrystalline

with difficulty into intense yellow substances ; but luteine is by nitri acid and some nitrates immediately transformed into a colourless o white product. The crystals of luteine have no similarity either i shape, size, or appearance, to those of hematoidine ; their facile sol bility in ether, chloroform, and alcohol, distinguishes them entirely fro hematoidine, which is quite insoluble in these agents. When Valentin (Günsburg's Zeitschrift N. F. 1, 46, 1859) stated that he had extracte "hematoidine" from gallstones by means of chloroform, he misto cholophæine or bilirubine for hematoidine. Cholophæine differs much from hematoidine on the one as from luteine on the other han

Diagnosis of luteine from cholophæine.

The mistake of Valentiner was repeated more formally by Robin an Riche (Compt. Rend. de Séances de l'Acad. de Sc. Tome 41, Séance d 1er Octob. 1855), who obtained a quantity of cholophæine from a cy in the liver, and by the aid of three elementary analyses, which clear show that they referred to cholophæine, came to the conclusion th they had to deal with hematosine (the body which we usually ter hematine) which had lost its amorphous character, and its iron, tak up an atom of water, and become crystallized hematoidine. It is on necessary to compare the reaction of Robin and Riche's hematoidi crystals with the reaction of cholophæine which I have described, order to be quite sure that they had cholophæine before them. On t other hand, none of the physical or chemical signs of their crystals a identical with those which Virchow has given as being characteristic hematoidine.

What ultimately remains of hematoidine, when the various bodi which have been ranged under its name are eliminated, is not difficu to tell. Hematoidine is probably decomposed hematocrystalline. crystals are most likely pseudomorphoses of the original forms of hem tocrystalline, consisting of the albuminous body intimately mixed wi the hematine which before decomposition constituted the soluble a crystallizable hematocrystalline. The amorphous hematoidine on t other hand is so little defined, that we cannot at present receive it a characterized chemical object.

I therefore add to the conclusions above given yet the following

4. Luteine differs entirely from hematoidine on the one and fr cholophæine on the other hand, and must not, and after this exposit cannot, any longer be confounded with either of them. 5. The bod described by Holm and Städeler under the name of hematoidine are hematoidine but luteine. 6. The bodies described by Valentiner a by Robin, Riche, and Mercier under the name of hematoidine are hematoidine but cholophæine or bilirubine. 7. Hematoidine is a u ful expression for certain microscopical crystals and bodies occurri in effused blood, the substance of which has not as yet been chemica isolated or defined.

The discovery of luteine in the ovaries, and of its identity with yellow matter of the yelks, may suggest some revision of the doctr of the homologies between the various parts of the ova of mammals the eggs of birds, and assist in elucidating the very obscure physiol of the corpora lutea. For, though it is easy to tell the mechan purpose of these growths, it is difficult to explain the object of t peculiar chemical ingredients.

c.

Butyro-luteine, the yellow ingredient of Butter.

Yellow and white butter.

It had never to my knowledge been asked in scientific inquiries, which particular circumstance butter owed its yellow colour. But

cularly during winter, might assume a perfectly white colour, and the prejudice of the producers or consumers termed it "poor." vendors to avoid the effect of this error had recourse to artificial ring ingredients. We shall see in the sequel how closely the dyeing ts used for this purpose, namely, the juice of carrots, and of the ns berry or annatto, resemble, in their optical phenomena at all ts, the natural butyro-luteine of good healthy butter.

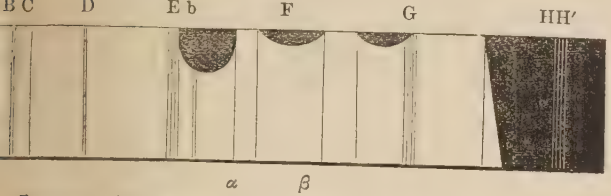
Dyed butter.

August last I obtained a small quantity of the butter which is larly supplied to St. Thomas's Hospital from a farm in the neighhood of London. It had a fine "rich" yellow colour, a pure fresh , and had been mixed with salt and formed into pats. On being l in hot water it remained opaque, from the salt, water, and caseine ; ts therefore mixed with an equal volume of chloroform, and the ion filtered from the deposit. This solution yielded spectrum—

St. Thomas's Hospital butter.

1. Band in blue, 90 to 108, Int. 2. R. α.
2. „ indigo, 116 „ 137, „ 1. „ β.
3. Third feeble band.

Ends at 189.



Intensity Diagram of Spectrum of Butter in Chloroform.

nother quantity of butter was now fused in a glass vessel, heated all the water had boiled away, and the salt and caseine had been ited, and filtered through paper on a heated funnel. In a test tube wed a fine golden colour, and before the spectroscope it exhibited the α and β bands of luteine, but moved by about 20 points more rds the violet end.

1. 110 to 123.
2. 134 to 153.
3. 159 to 173, very feeble.

End at 196.

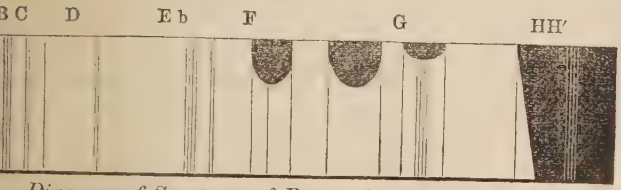


Diagram of Spectrum of Butter clarified and fused.

the butter cooled the bands became more intense ; the higher it ieated the less was the absorption exhibited by the bands. The band was not visible while the butter was very hot, but became y visible a moment before it congealed.

d.

Cysto-luteine in the fluid contents of an Ovarian Cyst.

e tumor came from a cow ; the entire ovary was one large cyst uring three inches in circumference and two inches in length. It

Luteine in fluid of an ovarian cyst.

contained a yellow fluid, which amounted to 35 cubic centimetres b measure. A slight deposit of fibrine of the size of a pin's head wa observed in it; it fluoresced green.

Spectrum: In thick layers red, yellow, and green, to 87, appeared where the spectrum was suddenly cut off. Diluted with half wate bands appeared—

1. In green 92 to 108=17; Int. 5; R. *α*.
2. In blue 115 „ 130=15; „ 3; „ *β*.

With gaslight it remained questionable whether or not there was third band. Drummond's light with a layer of the natural solutio 1 ctr. in thickness gave spectrum—

1. 92 to 108=17; Int. 5; R. *α*.
2. 116 „ 138=22; „ 5; „ *β*.
3. 150 „ 163=13; „ 1; „ *γ*.

End of violet at 195.

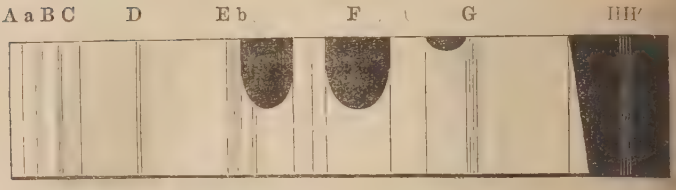

Diagram of Spectrum of Luteine from Ovarian Cyst.

The serous solution therefore yields the same measurements as th chloroform solution of ovario-luteine; it therefore probably contain the same kind of luteine as the corpora lutea. When I attempted t extract it the following was observed:—The fluid was so albuminou that on heating it became solid in the tube. Alcohol precipitated a immense quantity of albumen of a white colour, and itself assumed hardl any yellow colour. The luteine therefore adheres strongly to the pr cipitated albumen. I therefore preserved the mixture for a futu favourable opportunity, when it may be treated together with large quantities of similar matter.

Remarks.

The above observation, though single, appears to me particularl interesting; and it will be very important to ascertain whether the san holds good of ovarian cysts generally. The luteine contained insolub in the cells of the corpora lutea is here dissolved in an albuminous liqui If the deposition in granules was accompanied with the presence of fat granules, the solution is distinguished by the absence of all fat. Whi together with fat luteine could be easily extracted by alcohol, it cou scarcely be extracted by means of this agent from the albumino solution. The cells of the corpus luteum had perished, or not be formed; the limitary membrane of the Graafian follicle had, howeve apparently preserved a portion of its specificity as regards the chemi nature of its secretion. Fibrine, present in large quantity in the corp luteum, was here only slightly represented; albumen prevailed, acco panied by the soluble alkaline phosphates, which also occur in abu dance in the corpora lutea. The substance which I have above descrit as apparently attaching to the white corpuscles of the blood was n diagnosed in the serous fluid, and was probably absent.

e.

Seroluteine from Animal Blood.

Seroluteine from animal blood.

t has long been supposed that the serum of the blood contained a ow colouring matter, as it preserves a yellow colour, notwithstanding measures which may be adopted for its clarification. It was nised that this was colouring matter of bile, but this was negatived direct research. Cholophæine occurs in the serum only in diseases, icularly obstructive diseases of the liver, or those which cause great estion of the liver from a distance, like pneumonia and puerperal r. Normal blood has never been found to contain cholophæine. 1835 Martial Sanson published an essay on the colouring matters of blood (Journ. de Pharm. 21, 420), in which he announced the exist- e of a yellow colouring matter by the side of the ordinary red redient, but he did not state that it was contained in the serum. He ined it in the following matter :—Dried ox-blood was powdered and ed in alcohol of 18°, whereby a little grease and some salts were oved. The powder was then washed with distilled water. The poration of these washing waters yielded a residue of deep yellow ur and strong salty taste. This residue was now dissolved in hol of 18°, afterwards in alcohol of 36° containing some ether; it next filtered from albuminous and saline particles, and yielded nately a liquid which had a deep golden yellow colour.

Sanson's "matière jaune."

he blood thus deprived of its soluble salts and of a portion of its ow matter, was dried, and repeatedly exhausted with boiling alcohol 6°. The three first decoctions yielded on further treatment choles- ne and a small quantity of a brown matter, from which seroline could eparated. The fourth and subsequent decoctions were evaporated to ess by themselves and left a mixture of three substances. From e cold water extracted a *yellow matter*, warm alcohol a fatty tance, and there remained a thin layer of bluish matter, which ng been washed with alcohol and ether of temp. 40° C. dissolved in ng alcohol with a fine *sky-blue colour*.

roperties of the Yellow Matter.—It is soluble in water, alcohol, r, and fats. The concentrated acids and alkalies do not change it le cold. When dry and in bulk its colour is orange yellow. By rine it is discoloured, but the liquid contains no iron. It is the uring matter to which blood-serum owes its yellow colour, and it res to the fats which are extracted from blood by alcohol. As it y combines with other matters it is very difficult to obtain it ctly pure.

Properties of the "matière jaune."

ther proceeding for obtaining, and Properties of, the Blue Matter.— d is precipitated by basic lead acetate, the precipitate is dried, and d with alcohol of 36°. The liquid quickly assumes a blue colour. first decoctions become turbid on cooling, and deposit a large tity of fat, which carries the blue matter down with it; but after a a tincture is obtained which remains transparent, and from which lue matter can be isolated by the process stated above. When the blue matter is insoluble in cold alcohol, ether, and water; it little soluble in boiling alcohol, but is precipitated on cooling. concentrated acids do not change it; the very concentrated uric acid decomposes it. Ammonia by itself does not change it. nonia added to the alcoholic solution causes it to assume a greenish r, and the subsequent addition of an acid restores the blue colour; ine discolours it; the fluid contains no iron.

Properties of the "matière bleue."

nson states that Chevreul, Le Canu, and Lassaigne have met with

a similar blue matter in the blood of hysteric persons. He claims f himself the merit of having shown this matter to be a normal const tuent of blood. F. Simon and other subsequent investigators could n find the blue matter again, and of the yellow they could not form pure preparation or a clear idea. The production of a blue colour fro blood by means of ozonised ether has invested this question with a ne interest. To this we may add the question after the origin of th yellow matter in cholera urine, which with nitric acid yields a re and blue product, choleraic urorubine, and choleraic urocyanine, and th entire question of yellow, blue, and red matters observed in urine by number of chemists. Seeing that luteine from eggs and ovaries als yields a blue colour by nitric acid, surmises are naturally aroused an tested experimentally.

Treatment of serum for luteine.

I caused a quantity of sheep's blood to be collected in a glass vess in the slaughter-house, and to be placed in a secure corner. Afte 24 hours standing I carefully decanted the serum; this was no allowed to stand twice 24 hours in high cylindrical glass vessels, and th supernatant clear serum was drawn off from the deposit of bloo corpuscles by means of a syphon. It was then filtered repeatedl through many folds of finest filtering paper, but by no means it coul be made bright or translucent, it always retained a certain degree o opacity like ground glass. It was yellow, somewhat reminding of red In layers of from $\frac{5}{8}$ to $\frac{3}{4}$ inch it showed the blood spectrum before th spectroscope, and with the most powerful Drummond's light which could produce it exhibited the band α of luteine.

105 to 117=12 ; Int. 2 ; R. α. Blue interval to 125.

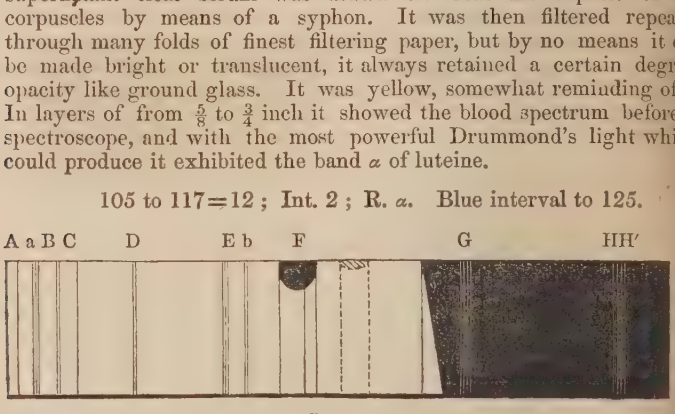

Diagram of Seroluteine. (*Blood-bands omitted.*)

(See also Plate V., fig. 10.)

I suspected at times the existence of a second band, at others al seemed to fuse into continued darkness. If the serum is diluted s that the absorption due to hematocrystalline is removed sufficiently so a not to interfere, the luteine bands become imperceptible. I hav faintly indicated a second band on the plate, but I am not absolutely certain about it. I believe, from repeated experiments, that serum cannot by any means be perfectly freed from blood corpuscles. I hav never seen serum without the blood-bands in the spectroscope, and it i not impossible that a great part of its yellow colour is due to thes corpuscles. Although the above spectrum has been indubitably see and scrutinized by me during an entire afternoon, I have failed in othe specimens of serum to find it, and therefore it is possible that it may b an accidental ingredient. I have not yet succeeded in extracting from serum, and believe that even if luteine were proved to b certainly and always present, the extraction would be exceedingl difficult. For I did not succeed, by a simple process of extractio

th alcohol, in obtaining any luteine from serum of an ovarian cyst, in ich this substance was unquestionably present in large quantity; so ongly does it adhere to precipitated albumen.

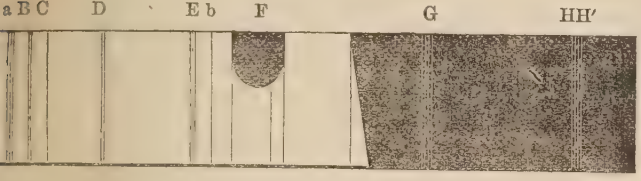
f.

Intestino-luteine from the Yellow Evacuations of sucking Infants.

Intestino-luteine from evacuations of sucking infants.

These fæces when healthy are of a golden yellow colour, semifluid nsistency, and a slight odour of warm sour milk. It is difficult to tain them without admixture, but their constituents cannot be mis-en. Mixed with alcohol in excess a great amount of a body having st of the properties of caseine falls down in flakes, while other tters dissolve, amongst them nearly the whole of the yellow coloured redient. The dilute solution exhibits an absorption band in blue, 3 to 115, which when the layer of fluid is made thicker gains in width, l becomes

101 to 118=17; Int. 4; R. *a*.



Intensity Diagram of Intestino-luteine.

Last reading 102 to 118. Only one band could be seen distinctly; a ond band was suspected at 126 to 142, but from 130 every part to let was already very dark. Chloroform and ether solution must be mined with a view to determine the question whether or not there is re than one band.

The alcoholic solution on standing became a little more red, but in thin ers was still yellow. It deposited a quantity of white cholesterine in stals. After standing in a stoppered bottle for a period of six weeks till showed the same spectral phenomena as at first.

Comparison of adult human excretions.

I compared some chloroform extract of dried adult human fæces ich had been kept during several years, and had been repeatedly ered from a precipitate which formed at intervals. The extract was low, showed no absorption band anywhere, and passed light to 7.

Physiological considerations.

Physiological considerations.—It has hitherto been generally accepted a matter requiring no proof that the fæces of infants and adults owed ir colour to an admixture of colouring matter of bile. Of course in case of an omnivorous adult the accidental ingredients were also en into account, but in infants the colour was to be derived from pure lophæine. The above observation shows this surmise to be quite ounded. Cholophæinates which are soluble in alcohol possess no ab-ption bands; the yellow extract of the evacuation of infants does not ld the reaction of cholophæine or bilirubine, and consequently, in case of infants at the breast, cholophæine is not excreted. But ther circumstance aided this erroneous belief, and this leads us to ne pathological considerations. When infants fed upon milk become arranged, their evacuations soon become green, and this phenomenon

Pathological considerations.

in itself is a sign of digestive disturbance. Now it was assumed that this green colour was due to biliverdine which had been produced from the bilirubine by the diseased process. It is, however, now very doubtful whether the green colour of diarrhœic fæces of infants, and of the meconium of the fœtus, is really produced by biliverdine. It is more probably a mixture of intestino-luteine with a peculiar blue product of its oxydation, or a green simple product of that oxydation.

Origin of intestino-luteine.

The origin of intestino-luteine itself it is not difficult to surmise. It might be derived from the milk, which, as I have shown above, contains in its butter globules a quantity of luteine with three bands. This luteine would therefore be required to undergo a considerable change before it could become intestino-luteine. But we have a much nearer source for this substance, and that is the mucous membrane of the intestine itself. The intestinal juice has a wine-yellow colour, as has been shown by the experiments of Thiry, lately confirmed by Quincke. It is probable that this colour is caused by the luteine here alluded to. The green colour of diarrhœic fæces might therefore be caused by a change in the secretive power of the membrane, or by an influence of the contents of the intestine upon the luteine secreted as such. Physiological inquirers, who have leisure to repeat the experiments of Thiry, should therefore be careful to place the intestinal juice before the spectroscope, in order to decide whether or not it possesses the absorption band of lacto-luteine above described.

B. *Vegetable Series.*

a.

Yellow Substances showing Spectra with continued Absorption of Blue, Indigo, and Violet, without detached Bands.

Such are exhibited by the yellow immediate principles of the following vegetable matters :—

French berries. (Chrysorhamnine, Xanthorhamnine.)
Weld or dyer's weed. (Luteoline.)
Quercitron. (Quercitrine.)
Turmeric. (Curcumine.)
Purrée. (Euxanthic acid.)
Careopsis lanceolata.
Heliochrysum bracteatum.
Viola lutea.
Acacia decurrens.
Helianthus macrophylla.
Berberis Darwinii.
Gnaphalium fœtidum.

French berries.

French Berries.—These berries are the fruit of several species of rhamnus. They differ in size and construction, but on an average are of the size of peas, and wrinkled all over their green surface ; they contain a number of small hard seeds, and have a disagreeable bitter taste. Of the four varieties of these berries which occur in trade I had only one, the real "graines d'Avignon," at my disposal ; the Persian, the Levantine or Turkish, and the Spanish berries are not easily obtained. The French berries come from rhamnus infectorius. The yellow matter obtained from a large light coloured variety of berries by Kane, chrysorhamnine, had the composition $C_{23}H_{22}O_{11}$. It was of golden yellow colour, insoluble in water, soluble in ether. By pro-

Chrysorhamnine and Xanthorhamnine.

;ed boiling with water while exposed to air it absorbed 1 H_2O and and was transformed into xanthorhamnine $C_{28}H_{24}O_{14}$. This latter oluble in water, but insoluble in ether ; it is present, ready formed, he dark brown variety of berries.

'he watery or alcoholic solution of xanthorhamnine presents a con- ous absorption of the blue end of the spectrum, without any detached ds. A saturated watery decoction of bruised berries was cleared up lcohol. It passed all colours from red up to 107. Diluted+1 the rption receded to 121 ; diluted+2 to 130 ; and 3 to 147 ; diluted ery pale yellow to 170.

Weld or Dyer's Weed (*Reseda luteola*).—Weld is now nearly obso- as a dye, picric acid having taken its place. The entire plant is vaded by a yellow colouring matter, which is extracted by decoction. s substance by its discoverer, Chevreul, has received the name of teoline." It crystallises in yellow needles, which sublime unchanged, less soluble in water than in alcohol and ether, and have an acid racter and reaction.

Weld or dyer's weed.

Luteoline.

n a decoction of weld greenish yellow flakes are deposited, consisting uteoline and other matters in chemical combination. The filtrate is lish yellow, and shows the general absorption of all yellow sub- ces, namely obscuration of the violet, indigo, and blue parts of the trum to 138. Diluted it passes all colours to 160. By no treatment d I obtain separate bands; but as the solution seems to contain a colouring matter as well as luteoline, the experiment should be ated upon pure luteoline.

Quercitron.—This is the bark of an oak tree of North America, rcus nigra or tinctoria. A preparation sold at the drysalters is ed extract of quercitron or "flavine." I have not been able to rtain the manner in which this is produced. Possibly it is an impure paration of the substance called by Chevreul "quercitrine," namely, deposit which forms when a decoction of the powdered bark is ved to stand for some days. Bolley believed that this consisted of citric acid, $C_{18}H_{16}O_9$, H_2O. But Hlasiwetz (Ann. Chem. 112, 107) ved its formula to be $C_{29}H_{30}O_{17}$. I produced a boiling watery solu- of the flavine, which was reddish and turbid. Its spectrum was off at 130 by a solution of the same tint as one of luteoline which off the spectrum at 135. The visible blue had a violet tinge. On ion the absorption receded to 135 ; diluted+2 to 140 ; +3 to 145 ; to 169. At this point it was only pale yellow. When still more ed to quite pale yellow the entire spectrum to 188 passed. No ls were detached at any time.

Quercitron.

Flavine.

Quercitrine.

Turmeric.—This substance, the root of yellow ginger, Curcuma longa, ains a yellow dye, curcumine, easily soluble in alcohol. A trans- nt solution passed red, &c., to 112 ; diluted blue to 117 ; more diluted 25. Again diluted with alcohol a hazy violet appears to 146 ; more ed indigo and violet to 185. No bands were detached at any time. as the extract contains a fluorescent substance which exhibits a n colour in the cone of sunlight, (it is not proved that curcumine is that fluorescent substance,) the absorption of the blue and violet be partly due to this matter, and not to the yellow dye only, which nt possess bands ; but the bands might disappear before the fluo- nt body is sufficiently diluted to let any light at all pass in blue violet. Turmeric becomes brown by alkali, and is used as a test for is in chemistry.

Turmeric, curcumine.

Fustet, or *fiset-wood*, the wood of Rhus cotinus, does not seem to be in dyeing any more ; I could not obtain any at the drysalters.

Fustet obsolete.

Purrée or Indian yellow.

Purrée or Indian yellow is a pigment of uncertain origin, probably the juice of a plant which is evaporated with magnesia. It contains *euxanthic acid* $C_{21}H_{18}O_{11}$. The solution of this acid is feebly coloured and has no particular bands. Its dyeing qualities appear best in combination with bases, particularly magnesia. The pigment which I obtained in the colour shops had been treated in this country, and was in thin cakes, not the roundish lumps of commerce.

The alcoholic extracts of the following *yellow flowers* also yielded spectra with continuous absorption of the blue end, without any bands.

Careopsis lanceolata.

Careopsis lanceolata.—Solution reddish-yellow, saturated. Cut off at 72; gradually to 100, where dark; diluted one-half recedes to 128; diluted two-thirds to 140. Diluted to pale yellow the entire spectrum passes. No bands at any time.

Heliochrysum bracteatum.

Heliochrysum bracteatum.—Orange yellow solution. Cut off gradually at 102. Diluted + 1 recedes to 124; + 2 recedes to 135; + 4 to 162; + 8 to 195. No bands at any time.

Viola lutea.

Viola lutea.—Light greenish yellow solution. Cut off at 129. Diluted + 1 recedes to 145; + 2 to 165; + 3 no further recession takes place, and no band is developed. The solution is now only palest greenish yellow.

Acacia decurrens.

Acacia decurrens.—Light greenish yellow solution. Cut off at 134. Diluted + 1 recedes to 148; + 2 to 155; + 5 to 163. The solution is now only palest yellow, + 10 to 170. Hardly coloured now; the matter which cuts off is perhaps colourless.

Helianthus macrophylla.

Helianthus macrophylla.—Solution pale yellow. Passes entire spectrum to 177, even in feeble light. No bands. Observation not conclusive; more concentrated solution to be examined.

Berberis Darwinii.

Berberis Darwinii.—Passes entire spectrum to 189. Questionable whether bands; more concentrated solution required, for which there was not enough material.

Gnaphalium fœtidum.

Gnaphalium fœtidum.—Cut off at 144. Diluted + 1 recedes to 160; + 2 to 165. No bands detached. Rest of spectrum very brilliant.

b.

Yellow Substances showing Spectra with a single Absorption Band.

Yellow wood.

Yellow wood, or *fustic*, is the wood of a kind of mulberry tree, *morus tinctoria*. It contains *moritannic acid*, $C_{14}H_{16}O_{10}$, which is the carrier of the tinctorial power, either free or in combination with calcium. To test its spectrum I made a decoction of powdered yellow wood, and evaporated the watery solution after filtration on the steam bath. After 24 hours standing an orange coloured precipitate, a mixture of the acid and its calcium salt, had deposited. Both the mother liquor and the solution of the isolated deposit presented the same spectral phenomena. The concentrated solution cut off the blue and violet and a portion of the green part of the spectrum.

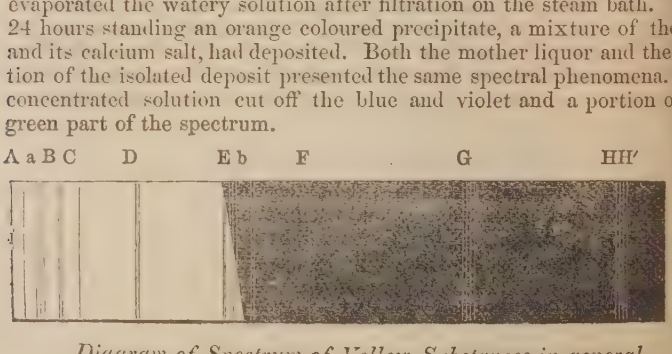


Diagram of Spectrum of Yellow Substances in general.

is absorption, common to all yellow coloured substances, I have represented in fig. 1, plate I. But on dilution the absorption ed to 130, leaving a detached very pale band.

100 to 115=15; Int. 2; R. *α*.

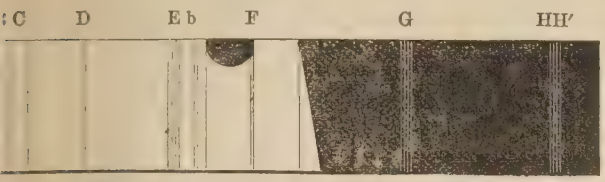

Diagram of Spectrum of Moritannic Acid.

See also Plate I., fig. 2.

vas not able to determine with certainty whether there was not a d band, as the solutions were always somewhat turbid, and the s of this research did not permit me to follow the subject further. owever, there are two analogous bodies, the one lactoluteine, already ibed, and the other the yellow colouring matter of the flower of alceolaria, which possess but one absorption band in blue, and on er dilution do not exhibit any other detached absorption, I take lence from these analogies to believe that moritannic acid also sses but one absorption band.

lceolaria.—The yellow variety of this esteemed flower yielded a Calceolaria. alcoholic extract of a splendid *orange* colour, which exhibited a e absorption band in blue.

1. 103 to 118=15; Int. 3; R. *α*.

Sharply cut off at 125.

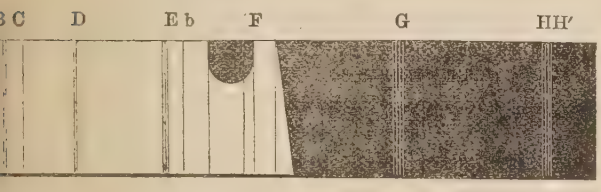

Diagram of Luteine of Calceolaria.

See also Plate I., fig. 3.

further dilution violet to 145 appeared, the band *α* disappeared, o new detached band was visible anywhere.

c.

Two-banded Luteine Spectra.

w Vegetable Matters which show Spectra very much resembling hat of Animal Luteine, but having probably Two Bands only.

Crocus or saffron, the stigmata and parts of the styles of a Crocus or saffron. eous plant, contains crocine, $C_{58}H_{84}O_{30}$ (?) It occurs also in the of Gardenia grandiflora. Concentrated sulphuric acid transforms

crocine into an indigo blue, later into a violet substance. Boiled with dilute acids it is split up into crocetine and sugar.

$$\underbrace{C_{68}\,H_{84}\,O_{30}}_{\text{Crocine.}} + 5\,H_2\,O = \underbrace{C_{34}\,H_{46}\,O_{11}}_{\text{Crocetine.}} + 4\,\underbrace{C_6\,H_{12}\,O_6}_{\text{Sugar.}}$$

Crocetine retains the principal dyeing properties of crocine, and its reaction with concentrated sulphuric acid.

A hot or cold alcoholic solution shows two bands in blue and indigo.

1. 114 to 135=21. Int. 4. R. α.
2. 145 „ 165=20. „ 4. „ β.

End at 184.

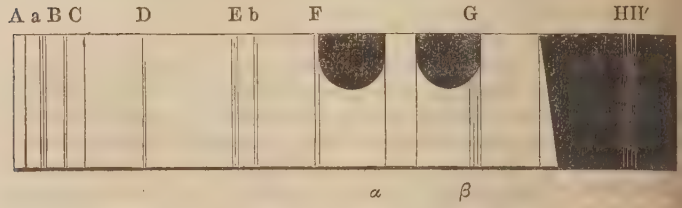

Diagram of Spectrum of Crocine.

See also Plate I., fig. 5.

In this spectrum the band β is placed more towards the violet end than in any other yellow solution I have yet examined. It just overlies the group of lines termed G; only in Verbascum phlomoides, plate III fig. 2, does the second band just touch G.

Helianthus annuus, Sunflower.

2. *Helianthus annuus*, Sunflower.—A small flower of this kind, from St. Thomas's Hospital gardens, gave a yellow but turbid water extract. The alcohol extract, however, was clear, and of a splendid yellow colour. It showed spectrum—

1, in blue, 109 to 125=16. Int. 5 R. α.
2, in indigo, 136 to 157=21. „ 4 „ β.

Cut off at 172.

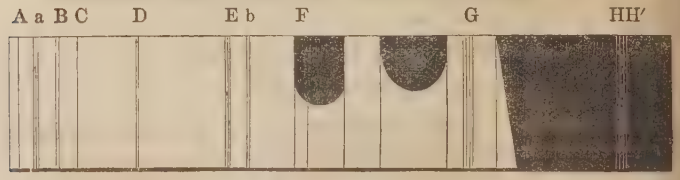

Diagram of Spectrum of Helianthus, yellow.

See also Plate I., fig. 6.

Much diluted, and with bright oxyhydrogen light, violet extends to 200, and there is probably no third band present.

Leontodon taraxacum, Dandelion.

3. *Leontodon taraxacum*, Dandelion.—The whole plant is officinal in the Pharm. Brit. the root only. Alcohol extract of the flower, concentrated, is cut off at 105. Diluted bands appear.

1. 110 to 124=14. Int. 3.
2. 130 to 153=23. „ 4.

ected band begins about 166, if present. Remarkable that the band is of greater intensity than the first.
diluted, and with strongest Drummond light, the third band possible from 160 to 179. End at 205.

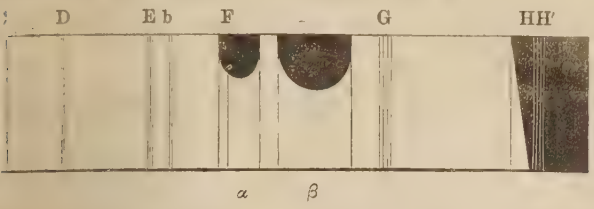

Diagram of Spectrum of Taraxacum—yellow.

See also Plate I., fig. 7.

Hieracium pilosella, yellow composite, from St. Thomas's Hospital s. Cold alcohol extract. Hieracium pilosella.

1. 110 to 125=15. Int. 3. R. α.
2. 135 „ 155=20. „ 3. „ β.

End at 190.

hird band appears on further dilution.

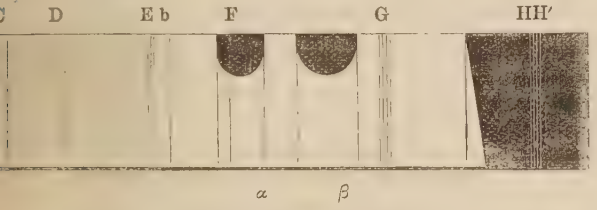

Diagram of Spectrum of Hieracium—yellow.

See also Plate I., fig. 8.

Gazonia elegans.—Flower orange, with black and white spots of petals. Has a white juice like Leontodon. Splendid deep cold alcohol extract, not so orange as that of calceolaria. Gazonia elegans.

1. 105 to 128=23. Int. 4. R. α.
2. 137 „ 158=21. „ 4. „ β.

End at 169.

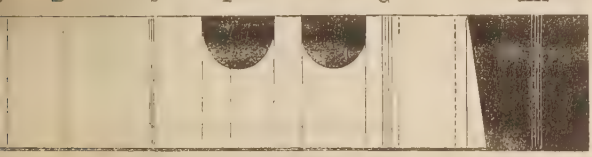

Diagram of Spectrum of Gazonia.

See also Plate I., fig. 9.

e diluted, violet is prolonged to 195, but a third band cannot ly be distinguished. Stronger light and more solution allowe a matical shade 168 to 187 to be distinguished.

6. *Hypericum oblongifolium.*—Solution yellow, made a deposit fro which it was filtered.

1. 113 to 125=12. Int. 4. R. α.
2. 136 „ 152=16. „ 3. „ β.

Last term a little uncertain. End at 160; after dilution at 184.

Hypericum oblongifolium.

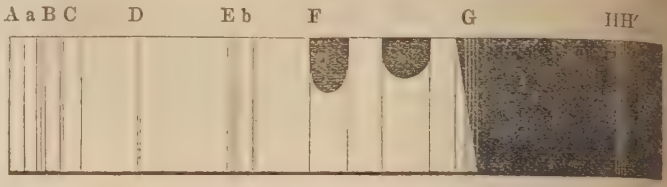

Diagram of Spectrum of Hypericum—yellow.

See also Plate I., fig. 10.

Acacia leprosa.

7. *Acacia leprosa.*

1. 113 to 127=14. Int. 4. R. α.
2. 136 „ 149=13. „ 3. „ β.

Last term uncertain. End at 170.

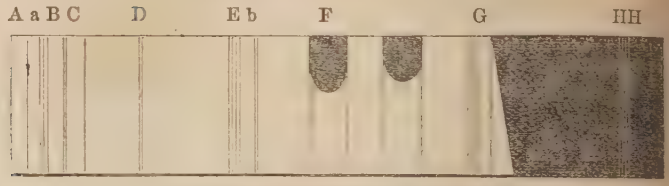

Diagram of Spectrum of Acacia leprosa.

See also Plate II., fig. 1.

Galphinia splendens.

8. *Galphinia splendens.*

1. 113 to 127=14. Int. 5. R. α.
2. 136 „ 155=19. „ 4. „ β.

Questionable third band. End at 191.

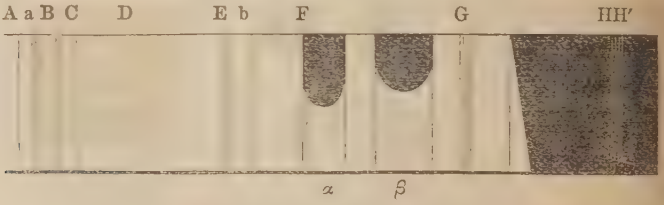

Diagram of Spectrum of Galphinia.

See also Plate II., fig. 2.

Stigmatophyllum ciliatum.

9. *Stigmatophyllum ciliatum.*

1. 115 to 129=14. Int. 4. R. α.
2. 137 „ 159=22. „ 3. „ β.

Questionable third band. End at 191.

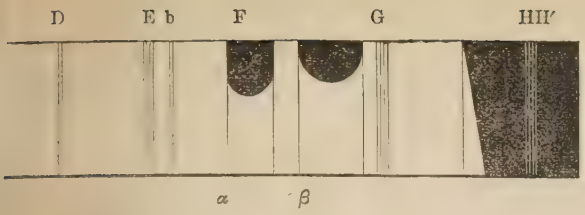

Diagram of Spectrum of Stigmatophyllum.

See also Plate II., fig. 3.

Lankasteria elegans.—Small quantity of dilute solution for ation. Lankasteria elegans.

1. 112 to 125.
2. 136 „ 155. Readings uncertain.

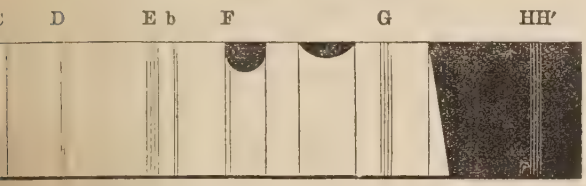

Diagram of Spectrum of Lankasteria flower.

See also Plate II., fig. 4.

Allamanda Neriifolia.—Splendid yellow flowers. Solution deep Allamanda Neriifolia.

1. 112 to 125=13. Int. 5. R. α.
2. 137 „ 157=20. „ 4. „ β.

End at 178.

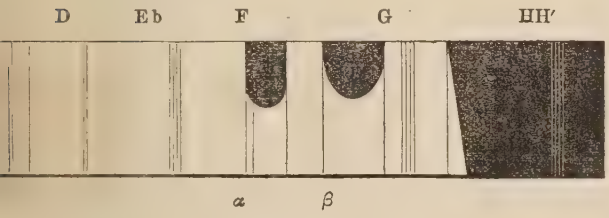

Diagram of Spectrum of Flower of Allamanda.

See also Plate II., fig. 5.

Colutea frutescens.—Solution slightly fluorescent. Colutea frutescens.

1. 107 to 119=12. Int. 3. R. α.
2. 128 „ 151=23. „ 2. „ β.

ible third band. End at 193.

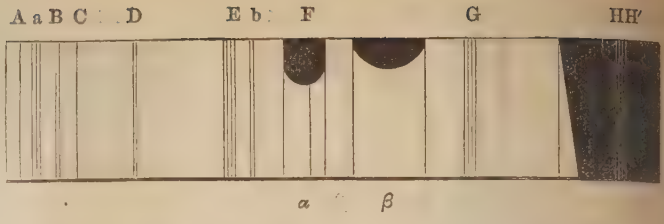

Diagram of Spectrum of Colutea frutescens.

See also Plate II., fig. 6.

Tagetil lucida.

13. *Tagetil lucida.*—Solution slightly fluorescent (?); becomes brilliant by heating.

1. 105 to 120=15. Int. 4. R. *a*.
Cut off at 130.

Diluted + 1 a second band appears.

2. 131 to 145=14, questionable.
End at 158.

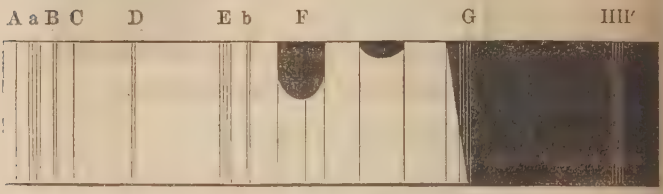

Diagram of Spectrum of Tagetil.

See also Plate II., fig. 7.

Schkuria atrovirens.

14. *Schkuria atrovirens.*—Very pale violet. Absorptions at minimum.

1. 108 to 123=15. Int. 1.
2. 130 „ 151=21. „ 1.
End at 190.

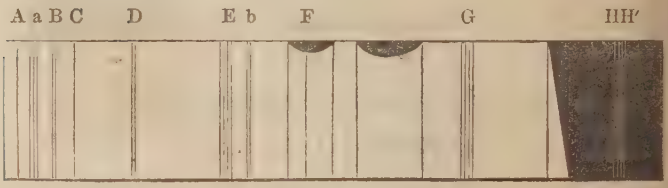

Diagram of Spectrum of Schkuria.

See also Plate II., fig. 8.

Diplotaxis tenuifolia.—Very pale yellow solution.

1. 113 to 124=11. Int. 2. R. α.
2. 131 „ 148=17. „ 2. „ β.

End at 185.

Diplotaxis tenuifolia.

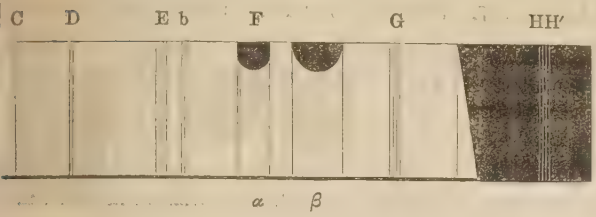

Diagram of Spectrum of Diplotaxis.

See also Plate II., fig. 9.

Virgilia sylvestris.—Very pale yellow.

Virgilia sylvestris.

1. 114 to 125=11. Int. 3. R. α.
2. 135 „ 153=18. „ 2. „ β.

Questionable third. End at 197.

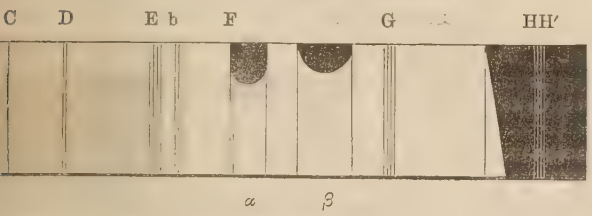

Diagram of Spectrum of Virgilia.

See also Plate II., fig. 10.

Oenothera grandiflora.

Oenothera grandiflora.

1. 102 to 126=24. Int. 3. R. α.
2. 135 „ 156=21. „ 2. „ β.

End at 178.

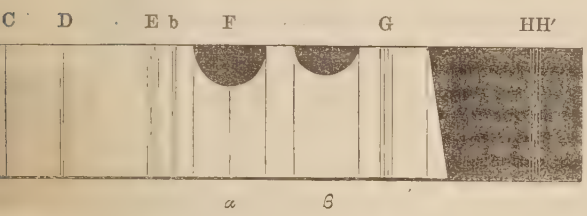

Diagram of Spectrum of Oenothera.

See also Plate III., fig. 1.

18. *Verbascum phlomoides.*—Deep yellow solution. Cut off at 100. Diluted +1.

1. 112 to 133=21. Int. 6. R. *α.*
2. 140 „ 163=23. „ 5. „ *β.*

End about 187. Diluted + 3 at 190. Bands then become very pale.

Verbascum phlomoides.

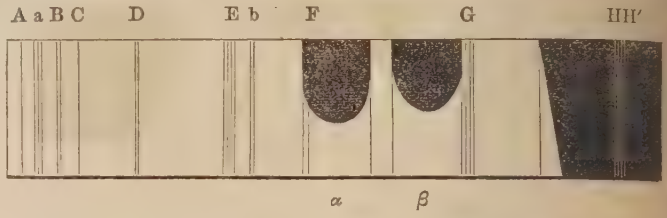

Diagram of Spectrum of Verbascum.

See also Plate III., fig. 2.

Tagetil pumila.

19. *Tagetil pumila.*—Solution turbid.

1. 113 to 125=12. Int. 5. R. *α.*
2. 133 „ 152=19. „ 2. „ *β.*

End at 170.

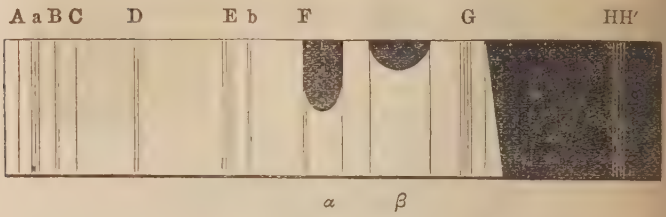

Diagram of Spectrum of Tagetil.

See also Plate III., fig. 3.

Helenium autumnale.

20. *Helenium autumnale.*

1. 107 to 122=15. Int. 5. R. *α.*
2. 132 „ 152=20. „ 4. „ *β.*

Dilution produces a suspicion of a third band. End at 190.

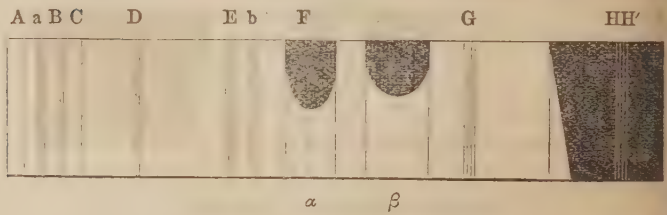

Diagram of Spectrum of Helenium.

See also Plate III., fig. 4.

. *Linosyris vulgaris.*—Cut off at 108. Diluted + 1.

1. 110 to 125=15. Int. 5. R. α.
2. 135 „ 157=22. „ 3. „ β.

Diluted + 2, suspicion of third band. End at 185.

Linosyris vulgaris.

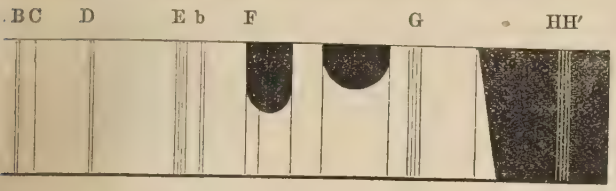

Diagram of Spectrum of Linosyris.

See also Plate III., fig. 5.

. *Solidago serotina.*—One band appearing diluted + $\frac{1}{2}$.

Solidago serotina.

1. 111 to 124=13. Int. 5. R. α.
2. 134 „ 157=23. „ 3. „ β.

Cut off at 164. Diluted + 3 ends at 185.

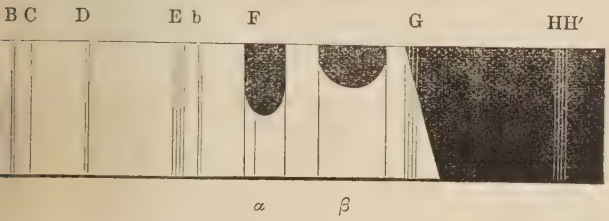

Diagram of Spectrum of Solidago.

See also Plate III., fig. 6.

Ruta graveolens.

Ruta graveolens.

1. 110 to 125=15. Int. 3. R. α.
2. 133 „ 158=25. „ 3. „ β.

End at 172. Diluted + 1 ends at 185.

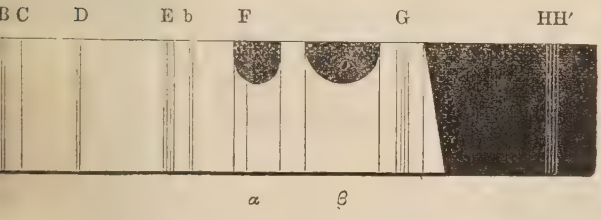

Diagram of Spectrum of Ruta.

See also Plate III., fig. 7.

Melilotus elegans.

24. *Melilotus elegans.*

1. 112 to 125=13. Int. 3. R. α.
2. 135 „ 157=22. „ 2. „ β.

End at 165. Diluted+1 ends at 188.

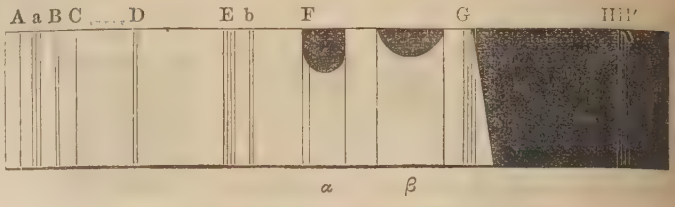

Diagram of Spectrum of Melilotus.

See also Plate III., fig. 8.

Medicago elegans.

25. *Medicago elegans.* — Very dilute solution, layer of 2 ctrs. required.

1. 113 to 126=13. Int. 2. R. α.
2. 135 „ 154=19. „ 2. „ β.

Ends at 163.

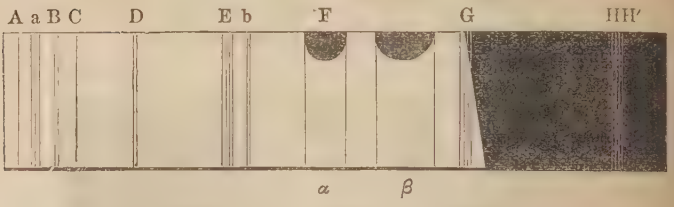

Diagram of Spectrum of Medicago.

See also Plate III., fig. 9.

Allamanda Hendersonii.

26. *Allamanda Hendersonii.*

1. 113 to 125=12. Int. 3. R. α.
2. 134 „ 158=24. „ 4. „ β.

Cut off at 165.

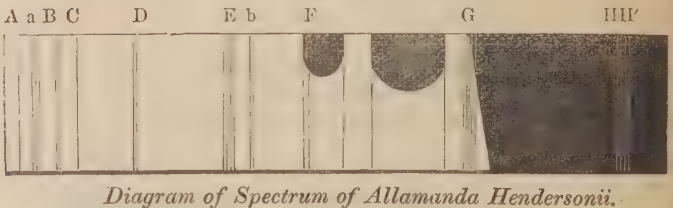

Diagram of Spectrum of Allamanda Hendersonii.

See also Plate III., fig. 10.

In the foregoing I have described all the varieties of luteine yielding two-band spectra which I have been able to meet with in *flowers* during the month of September 1868. I have ranged amongst them all those in which a third band might have been suspected but could not be shown to exist. In the following I am going to describe a series of two-band spectra from other parts of plants, particularly *berries* and *seeds*.

Spectra of berries and seeds.

Asparagus officinalis.

27. *Asparagus officinalis.*—Those who remember the learned essay of the celebrated anatomist Fallopia on the asparagus, will think it fitting that

for scientific contemplation should be drawn also from the berries is remarkable plant. The red berries were rubbed with alcohol in ortar, and the seeds removed. A yellow solution formed, but the oloured matter appeared to remain insoluble. The spectrum of this ion was cut off at 115; there was a haze all over the region of blue. matter was now boiled with water, and after 24 hours filtered. e coloured matter had dissolved. The red residue was now treated *warm* alcohol, and yielded all colouring matter easily to the boiling . On cooling a portion of the matter deposited in red flakes. trum of the solution:

1. 110 to 128=18. Int. 3. R. α.
2. 138 „ 156=18. „ 3. „ β.

Possible third band. End at 195.

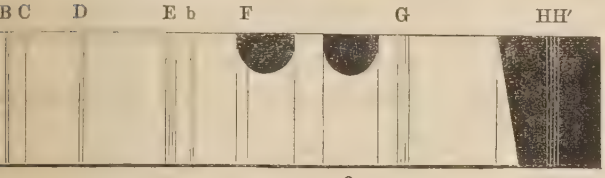

Diagram of Spectrum of Asparagus Berries.

Compare also Plate IV., fig. 1.

Physalis Alkekengii.—The husk of the berry is a wide red bag. Physalis Alkekengii.

1. 104 to 120 =16. Int. 3. R. α.
2. 129 „ uncertain=18. „ 1. „ β.

Solution 2 ctrs. thick. No bands in layer of ctr.

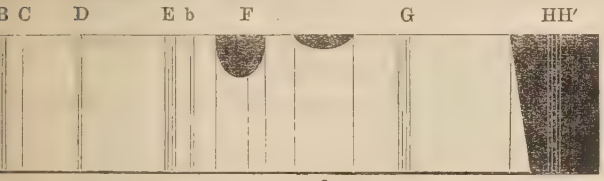

Diagram of Spectrum of Husk of Physalis Berry.

See also Plate IV., fig. 2.

Solanum Dulcamara Berries.—Solution saturated yellow to orange. Solanum Dulcamara.

1. 107 to 122=15. Int. 2. R. α.
2. 128 „ 151=23. „ 2. „ β.

Suspected third. End at 190.

Diagram of Spectrum of Solanum Dulcamara Berries.

Compare Plate IV., fig. 3.

30. *Solanum Capsicastrum Berries.*—Pale yellow solution. *Fluo*
resces distinctly, and in that respect is the only yellow substanc
showing detached bands which I have met with.

1. 106 to 120. Very pale } Solution 3 ctrs.
2. 130 „ 149. do. } thick.

Ends at 188.

Solanum capsicastrum.

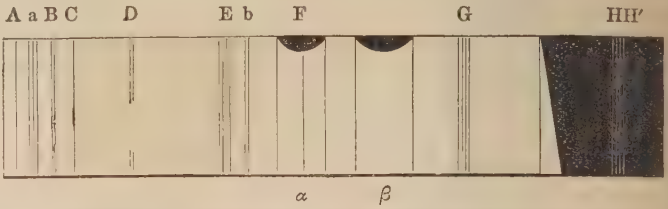

Diagram of Spectrum of Solanum Capsicastrum Berries.

See also Plate IV., fig. 4.

Cyphomandra betacea.

31. *Cyphomandra betacea.*—Large oval berry. Solution pale yellow
Layer 3 ctrs. thick.

1. 103 to 114=11. Int. 3. R. α.
2. 125 „ 145=20. „ 2. „ β.

Ends at 163.

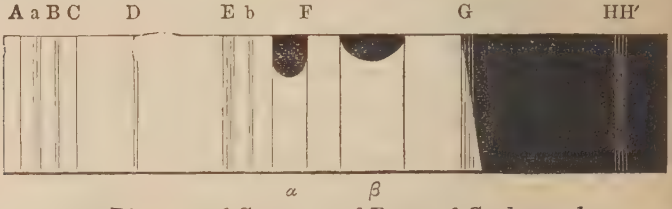

Diagram of Spectrum of Berry of Cyphomandra.

See also Plate IV. fig. 5.

Cratægus cnut Galli.

32. *Cratægus cnut Galli Berries.*—Red solution 2½ ctrs. thick. Cu
off at 97.

1 ctr. thick pale yellow, shows spectrum:

1. 102 to 114. Int. 1.
2. 124 „ 142, „ 1.

Ends at 180.

2 ctrs. thick it shows spectrum:

1. 100 to 116 = 16. Int. 4. R. α.
2. 124 „ 148 = 24. „ 3. „ β.

Ends at 160.

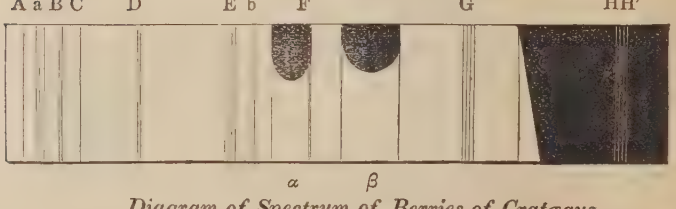

Diagram of Spectrum of Berries of Cratægus.

See also Plate IV., fig. 6.

33. *Pyrus Aria Berries.*—Yellow solution, 2 ctrs. thick.

1. 103 to 118 = 15. Int. 4. R. α.
2. 126 „ 147 = 21. „ 3. „ β.

Ends at 163.

With a layer of 1 ctr. thick bands disappear and end at 190.

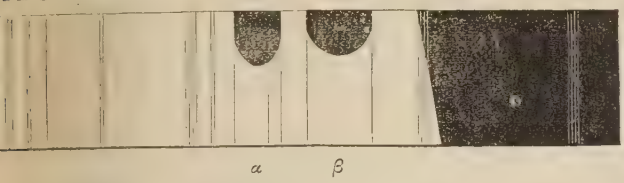

Diagram of Spectrum of Berries of Pyrus Aria.

See also Plate IV., fig. 7.

Zea Mais.

34. *Zea Mais or Indian Corn;* Seeds.—The powdered seeds treated with warm alcohol yielded a golden yellow solution which became turbid on cooling; it shed a deposit on standing and then was clear. The very concentrated solution showed red and yellow, and was cut off at 165. First probable band on slight dilution, 105 to 123. More dilute solution, 1. 107 to 118; 2. 128 to uncertain. A more clear but more dilute solution 2 ctrs. thick showed, 1. 107 to 118; 2. 128 to 147. Ultimately the following measurements were adopted as final:

1. 108 to 122 = 14. Int. 2. R. α.
2. 128 „ 148 = 20. „ 2. „ β.

Last line difficult to read and somewhat doubtful.

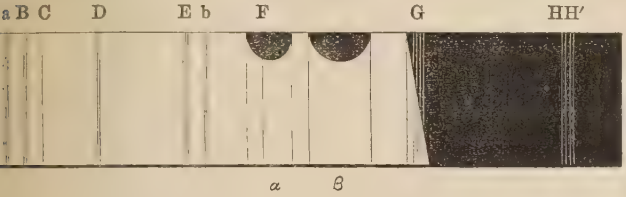

Diagram of Spectrum of Maize Seeds.

See also Plate IV., fig. 8.

These bands, therefore, are the same almost as those of the alcohol solution of ovario-luteine, which read—

1. 107 to 120.
2. 128 „ 149.

There is a matter contained in the extract of the seeds which absorbs entirely the violet end where a third band might possibly appear, and which appear in the animal, and some vegetable luteine solutions.

d.

Three-banded Luteine Spectra.

Three-banded luteine spectra.

I pass now to a series of vegetable spectra which most closely resemble the spectra of animal luteine already described. In some of them the

third band is less distinct than in the animal luteines, in others i more distinct, and the whole of the three-banded spectra have there on plate IV., fig. 9 and 10, plate V., fig. 1 to 10, and plate V fig. 1 to 3, been arranged in accordance with this progression distinctness.

Common carrot, Carotine.

Daucus carrota, Common carrot-root.—The colour of the carro due to a particular matter termed *carotine*, $C_{18}\,H_{24}\,O$. It is redd brown in crystals, crystallises in cubes, smells like the Florentine vio root, and with concentrated sulphuric acid becomes blue, and dissol with the same colour. However similar, therefore, the spectrum carotine may be to that of the animal luteines, its chemical proper seem to be different. Carotine heated to 150 becomes reddish-bro and in that state is the substance to which so-called cichory, or chic owes its tinctorial qualities and fraudulent use.

Some carrots were scraped and extracted with warm alcohol. yellow solution on cooling became opaque and was again filtered.

1. 103 to 120 = 17. Int. 5. R. α.
2. 128 „ 149 = 21. „ 5. „ β.

End at 160. Dilution + 1 extended violet to 197, and there appe a feeble band.

3. 165 to 180 = 25. feeble 5 R. γ.

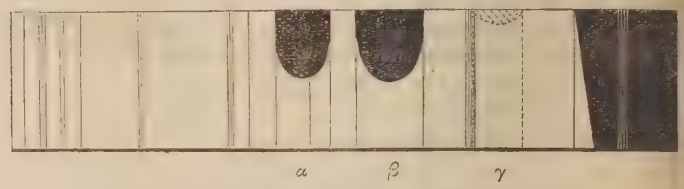

Diagram of Spectrum of Common Carrot.

See also Plate IV., fig. 9.

Bixa orellana, or Annatto.

Annatto, or *Orlean*, the flesh of the fruit of *Bixa orellana*, a S American tree. It occurs in trade as a plastic red paste. It con perhaps two colouring matters, of which *orelline* is the least ch terised. *Bixine* is the main dyeing ingredient; it is little solubl water, easily in alcohol and ether, with orange colour. Concentr sulphuric acid colours it *blue*, next *violet*; nitric acid changes it to g ultimately yellow. A concentrated alcohol solution of orange c cut the spectrum off at 77. On dilution the absorption gradually rec towards 89, further to 92. When more diluted, so that the sol was yellow, absorption receded to 103. Again diluted to light yell spectrum of bands appeared :

1. 105 to 121 = 16. Int. 5. R. α.
2. 132 „ 148 = 16. „ 4. „ β.
3. 167 „ 178 = questionable.

Blue to 203.

At a particular dilution, with strongest Drummond's light I meas finally—

1. 106 to 124 = 18. Int. 5. R. α.
2. 129 „ 153 = 24. „ 5. „ β.
3. 162 „ 181 = 19. „ 1. „ γ.

End at 205.

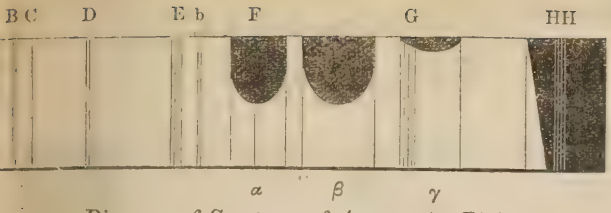

Diagram of Spectrum of Annatto, or Bixine.
See also Plate IV., fig. 10.

nnatto is used for dyeing silk. Most English cheese is dyed with
tto and turmeric.

alendula officinalis, Common Marigold.—The cold alcoholic extract a splendid yellow colour. Like the extract of calceolaria, the concen- d solution cuts the spectrum off at blue. Diluted there appears— Calendula, Marigold.

109 to 123 = 14. Int. 3. R. γ. Sharply cut off at 127. On dilu- second band appears, which has now treble the strength of the first, h latter becomes int. 2.

129 to 146 = 17. Int. 5. R. α.
156 „ 177 = 21. „ 5. „ β.

End at 189.

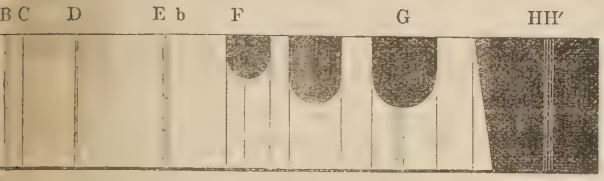

Diagram of Spectrum of Flower of Marigold.

gain diluted band 1 almost disappears, and 2 and 3 remain of 2. In this spectrum the three bands are most distinct, but the bution of intensity is most peculiar.

rysopsis villosa. Chrysopsis villosa.

1. 109 to 120=11. Int. 8. R. α.
2. 131 „ 154=23. „ 5. „ β.

luted + 1 there appears—

3. 167 to 183=16. „ 1. „ γ.

End at 200.

COMMISSION.

VICTORIA R.

Victoria, by the Grace of God, of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith, to Our right trusty and well-beloved Councillor Charles Bowyer Adderley; Our right trusty and right well-beloved Cousin Charles, Earl of Romney; Our right trusty and right well-beloved Cousin and Councillor Henry John, Earl of Ducie; Our right trusty and well-beloved Councillor Robert Montagu (commonly called Lord Robert Montagu); Our right trusty and well-beloved Councillor Russell Gurney, Recorder of Our city of London; Our right trusty and well-beloved Councillor Stephen Cave; Our trusty and well-beloved Sir Thomas Watson, Bart., Doctor of Medicine; Our trusty and well-beloved Charles Brisbane Ewart, Esq., Lieutenant-Colonel in Our Corps of Royal Engineers; Our trusty and well-beloved John Robinson McClean, Esq., Civil Engineer; Our trusty and well-beloved Samuel Whitbread, Esq.; Our trusty and well-beloved John Tomlinson Hibbert, Esq.; Our trusty and well-beloved Evan Matthew Richards, Esq.; Our trusty and well-beloved George Clive, Esq.; Our trusty and well-beloved Francis Sharp Powell, Esq.; Our trusty and well-beloved Benjamin Shaw, Esq.; Our trusty and well-beloved James Paget, Esq., Fellow of the Royal College of Surgeons; Our trusty and well-beloved Henry Wentworth Acland, Esq., Doctor of Medicine; Our trusty and well-beloved Robert Christison, Esq., Doctor of Medicine; Our trusty and well-beloved William Stokes, Esq., Doctor of Medicine; Our trusty and well-beloved John Lambert, Esq.; and Our trusty and well-beloved Francis Thomas Bircham, Esq., greeting:

Whereas We did, by warrant under Our Royal sign-manual, bearing date the twenty-fourth day of November one thousand eight hundred and sixty-eight, appoint Our right trusty and well-beloved Thomas George, Baron Northbrook (since resigned), together with the several noblemen and gentlemen therein named, to be Our Commissioners to inquire into the operation of the sanitary laws for towns, villages, and rural districts in Great Britain and Ireland, and into the several matters and things in such Warrant at large set forth:

Now know ye, that We have revoked and determined, and do by these presents revoke and determine the said warrant, and every matter and thing therein contained:

And whereas We have deemed it expedient that a new Commission should issue to inquire into and report on the operation of the sanitary laws in England and Wales, with the exception of the city of London and the liberties thereof, and all places under the jurisdiction of the Metropolitan Board of Works appointed under the Metropolis Management Act, 1855, so far as these Laws apply to Sewerage, Drainage, Water Supply, removal of Refuse, control of Buildings, prevention of Overcrowding, and other means of promoting the Public Health:

Also to inquire into and report upon the operation of the Laws for preventing the introduction and spreading of Contagious and Infectious Diseases, and Epidemics affecting the health of Man:

Also to inquire into and report upon the administration of the aforesaid Sanitary Laws, including in such inquiry and report the constitution of the Central and Local Authorities charged with the administration of such Laws, and the formation of Areas proper to be controlled by Local Authorities.

Also to inquire into and report upon the operation of that part of the Registration System which relates to Certificates of Causes of Death.

Also to suggest improvements in all or any of the matters aforesaid, and means proper for carrying into effect the suggested improvements.

Now know ye, that We, reposing great trust and confidence in your knowledge and ability, have authorized and appointed, and do by these presents authorize and appoint you the said Charles Bowyer Adderley; Charles, Earl of Romney; Henry John, Earl of Ducie; Robert Montagu (commonly called Lord Robert Montagu); Russell Gurney; Stephen Cave; Sir Thomas Watson; Charles Brisbane Ewart; John Robinson McClean; Samuel Whitbread; John Tomlinson Hibbert; Evan Matthew Richards; George Clive; Francis Sharp Powell; Benjamin Shaw; James Paget; Henry Wentworth Acland; Robert Christison; William Stokes; John Lambert; and Francis Thomas Bircham, to be Our Commissioners for the purposes aforesaid.

And for the better effecting the purposes of this Our Commission, We do by these presents give and grant to you, or any five or more of you, full power and authority to call before you, or any five or more of you, such persons as you shall judge necessary, by whom you may be the better informed of the truth on the subjects herein submitted to your consideration, and every matter connected therewith, and also to call for, have access to, and examine all such official books, documents, papers, and records, as may afford the fullest information on the subject of this Inquiry; and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

And Our further will and pleasure is that you, or any five or more of you, do report to us with all convenient speed, under your hands and seals, your opinion on the several matters herein submitted for your consideration, with power, from time to time, to make a separate report in respect of any of the matters aforesaid on which it may seem expedient to you so to report:

And We do further will and command, and by these presents ordain, that this Our Commission shall continue in full force and virtue, and that you, Our said Commissioners, or any five or more of you, may from time to time proceed in the execution thereof, although the same be not continued from time to time by adjournment;

And for your assistance in the execution of these presents, We have made choice of Our trusty and well-beloved William Hornby Birley, Esq., Barrister-at-Law, to be Secretary to the said Commission, whose services and assistance We require you to use from time to time, as occasion may require.

Given at Our Court at St. James's, the twentieth day of April 1869, in the Thirty-second Year of Our Reign.

By Her Majesty's Command,

(Signed) H. A. BRUCE.

FIRST REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, Your Majesty's Commissioners appointed to inquire into and report on the operation of the Sanitary Laws in England and Wales, with the exception of the City of London and the Liberties thereof, and all places under the jurisdiction of the Metropolitan Board of Works, appointed under the Metropolis Management Act, 1855, so far as these laws apply to sewerage, drainage, water supply, removal of refuse, control of buildings, prevention of overcrowding, and other means of promoting the public health. Also to inquire into and report upon the operation of the laws for preventing the introduction and spreading of contagious and infectious diseases, and of epidemics affecting the health of man. Also to inquire into and report upon the administration of the aforesaid Sanitary Laws, including in such inquiry and report the constitution of the central and local authorities charged with the administration of such laws, and the formation of areas proper to be controlled by local authorities. Also to inquire into and report upon the operation of that part of the registration system which relates to certificates of causes of death. Also to suggest improvements in all or any of the matters aforesaid, and means proper for carrying into effect the suggested improvements, have held several meetings, and although we have not yet completed our inquiries, humbly beg leave to submit to Your Majesty the evidence given before us up to and inclusive of the meeting held upon the 5th day of August 1869.

(Signed) C. B. ADDERLEY,
Chairman.

August 1869.

LIST OF WITNESSES.

Name of Witness.	Office held by Witness, &c.	No. of Question.	Page.

MINUTES OF EVIDENCE,

TAKEN BEFORE THE

ROYAL SANITARY COMMISSION.

Monday, 26th April 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of DUCIE.
The Right Hon. LORD ROBERT MONTAGU, M.P.
The Right Hon. RUSSELL GURNEY, M.P., Q.C.
The Right Hon. STEPHEN CAVE, M.P.
Sir THOMAS WATSON, Bart., M.D., F.R.S.
Lieut.-Colonel EWART, R.E.
JOHN ROBINSON MCCLEAN, Esq., M.P.
JOHN TOMLINSON HIBBERT, Esq., M.P.
EVAN MATTHEW RICHARDS, Esq., M.P.
GEORGE CLIVE, Esq.
FRANCIS SHARP POWELL, Esq.
JAMES PAGET, Esq., F.R.S.
HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
FRANCIS THOMAS BIRCHAM, Esq.

(1.) TOM TAYLOR, Esq., examined.

Tom Taylor, Esq.

26 April 1869.

1. (*Chairman.*) Will you state the office which you fill?—I am secretary of the Local Government Act Office, in connexion with the Home Office.

2. What is the relation of the Local Government Office to the Home Office?—The head of our office is the Home Secretary, and all our official acts are done in his name and through him, the powers which we administer under the Local Government Acts and the Sanitary and Sewage Utilization Acts being functions of the Home Office.

3. Have you any other functions besides those which arise under the Acts which you have named?—We have none which are imposed upon us by Acts of Parliament. We give opinions and advice on matters arising under the Nuisance Removal Acts, but that is not *ex officio*.

4. By what authority do you give advice under the Nuisance Removal Acts?—We do so because those matters come naturally within the functions which are imposed upon the office by Act of Parliament.

5. How long have you been connected with the office which you now occupy?—I began to work with the General Board of Health early in 1850. I have been acting ever since, without intermission, in the same work, in connexion with either the General Board of Health or the Local Government Act Office.

6. Is it a fact that the Board of Health ceased to exist in the year 1858, and that the Local Government Act Office commenced from that period?—The General Board of Health existed until 1854 in the form in which it was originally constituted, namely, a board consisting of the head of the Office of Works, or the Office of Woods and Works as it was then, an unpaid member and two paid members. In 1854 the original board expired and was succeeded by a board constituted of a president and *ex-officio* members, namely, the President and Vice-President of the Board of Trade, and the Principal Secretaries of State. That board continued to act from 1854 to 1858 when the distinct existence of the General Board of Health ceased, and its functions were transferred to the Home Office. From that time the work which we have done has been done through the Home Office, and as part of the work of the Home Office.

7. So that the change in 1858 was to transfer the central authority from the Board of Health to the Home Office?—Yes.

8. And at that period the Local Government Act Office began to exist?—Yes, under that name; it continued in the same premises which it had occupied under the name of the General Board of Health, but its work has been done under the name of the Local Government Act Office from the year 1858.

9. So that you have not only been at the head of the Local Government Office ever since it first existed, but you are also acquainted with the proceedings relating to the Board of Health?—Yes, from 1850, in fact, continuously.

10. Will you state what have been the principal changes within your experience in the administration of these Acts?—As regards the central authority, I have already pointed out the principal change, namely, in 1854 from an office consisting of four members to one consisting of a single member, while in 1858 there was a total extinction of the separate General Board of Health, and a transfer of its work to the Home Office. From that time the Acts have continued to be administered by the Home Office. I may also state that within that time the Burial Acts have come into operation, which are also administered by the Home Office.

11. Through you?—Not through me, but through a separate inspector, that is to say through a separate branch of the Home Office. The work of sanitary inspection proper, which used to be carried on by the General Board of Health, has been transferred to the Medical Department of the Privy Council, which was created in 1858. Then a very important change in the central administration of sanitary law took place in 1866 when, what is called the Sanitary Act of 1866 was passed, the 49th section of which gives an appeal to the Home Secretary in all cases of default by local authorities administering general Acts for purposes of local improvement, whether the Local Government Act, the Sanitary Act, or the Nuisances Act.

12. Is the Act to which you have just referred the only Act which gives an appeal to the Home Secretary?—There are specific appeals on special points under the Local Government Act, but that is the only Act which gives a general appeal.

13. When you refer to the Burial Acts and the medical department, am I to understand you to say that with reference to those two particular subjects

Tom Taylor, Esq.

26 April 1869.

the Home Office has a direct relation to them from the old Public Health Office?—The Burial Acts department was created by the original Burial Acts, and the General Board of health prepared those Acts, and conducted the inquiry which led to them, but the administration of those Acts was always vested in the Home Office. The duties of the medical department of the Privy Council were originally discharged by the general board of health, in so far as they were discharged at all; so that there was a change. The duty of conducting appeals in cases of default by local authorities was created by the Sanitary Act of 1866. There were two Acts, which were called Sewage Utilization Acts, passed in 1865 and 1867, which give powers to the Secretary of State to sanction loans for works of sewerage, and which constitute certain local authorities with powers to raise such loans, and to carry out sewerage works all over the country. Those two Acts in effect give to some local body in every part of the country the same powers as a local board, under the Local Government Act for sewering their district, and for borrowing money for that purpose.

14. I understand that there is a division of the central authority at present existing over the different sanitary subjects, including medical; the medical branch being under the Privy Council, and the sanitary branch being under the Local Government Office?—Local improvement, or default in the execution of powers for local improvement, is under the Home Office. Inquiries into cases of epidemic disease, or outbreaks of fever and similar inquiries, are conducted by the Medical Department of the Privy Council.

15. Is it your opinion that the central authority ought to embrace all these various subjects to which you have alluded, including the medical department which is now a sub-department under the Privy Council?—I think so.

16. And you see objections in practice to the division of these subjects, they being partly under one head office and partly under another head office?—I think that there are such objections.

17. Will you state generally, what are your objections to the division of these various subjects between two central authorities?—Generally, I should say that it renders necessary an amount of correspondence, backwards and forwards, between the Home Office and the Privy Council Office which is perfectly unnecessary, and which leads to waste of time, and frequently to action being taken by either department without the knowledge of the other For instance, we receive complaints from a place of the general neglect of sewerage, or of cleansing of privies and cesspools, and similar matters. At the same time the Privy Council receives a complaint of the existence of fever in that place. I will take a village called Cuckfield, a coal-mining village in the north of England, near Darlington, in which we had such a case the other day. We were charged with the duty of inquiring into the neglect of the local authority as regarded the provision of privies and the cleansing of them; the Medical Department of the Privy Council was charged with the duty of inquiring into the results of that neglect. That involved, you may say, two separate courses of proceeding, which required co-operation between us at every step in order to conduct the investigation efficiently, and yet the two inquiries being in two different offices, it was only by a special arrangement that we were enabled to go on and make inquiries together; that is to say, that the inspectors were put in co-operation, and received instructions in common, all of which should have emanated from one head. The two authorities were very likely to overlap. In the case of a place called Terling they did actually come into collision, that is to say, the medical officer of the Privy Council advised the authorities of the district, while fever existed, as to what they should do in the way of works to resist it; but our inspector found it rather necessary to check his advice. He found that cesspools were being constructed by the advice of the officer of the Privy Council which he considered were unequal to the needs of the district, and were likely to do more mischief than they were likely to cure, and there was a collision between the two departments which never would have arisen if they had been working under one head, and receiving their instructions from one source.

18. (*Mr. Clive.*) During the years following 1858, when I had the pleasure of communicating with you, did you feel your staff strong enough for the work which you had to do?—Our staff is certainly not strong enough for the work which it has now to do.

19. I refer to the years 1858, 1859, 1860, and 1861?—We felt our weakness less then than we do now, because our duties were not so large then as they are now, but our duties since then have been increasing, and our staff has not increased in proportion, in any sense.

20. You had then only two inspectors?—Yes, and we have now three, but still the three whom we have now are much less able to do the duty which at present devolves upon them than the two were then.

21. Do you not think that that difficulty of an insufficient staff might be got over by a union of the two authorities?—I am not aware that it would, because the inspectors' staff of the two offices is different. The inspectors of the medical department are doctors, and attend to the medical part of the questions into which they have to inquire, while our inspectors are engineers, and attend rather to the question of works, and sometimes incidentally to questions of law in connexion with works, and questions of boundary and outfall.

22. Is it your opinion that the union of the two offices, namely the medical department of the Privy Council and the local government department of the Home Office would not tend to an economy of labour?—It would no doubt tend to an economy of labour in the office itself; it would tend to a diminution of clerk's work and letters, and all the work of the office proper; but not to a diminution of the labours of inspection.

23. (*Lieut.-Col. Ewart.*) You have referred to a central authority, taking up the duties which are now performed by your department of the Home Office, and by the medical department under the Privy Council Office. If you had a central authority, would not that central authority also with advantage take up the Burial Acts?—That is now administered by the Home Office, and I presume that it would remain as it is now. The central authority which I have contemplated for the whole work is the Home Office, as it is now.

24. Then you would include the Burial Acts?—Yes, as they are now administered, through the Home Office.

25. You would, as I understand you, centralize all the departments under you?—I should not centralize them more than they are centralized now, but at the same time I should put them all under one central office, which is the Home Office.

26. (*Dr. Acland.*) In the working of the Diseases Prevention Act, does any question which arises under that Act come in any way under the Home Office?—No, that is now administered entirely through the Medical Department of the Privy Council. That would be a part of the duties of the Medical Department which would be transferred to the Home Office, supposing such a change to be made as I should recommend.

27. I understand with regard to the Diseases Prevention Act, that it is the Act under which the superintendence of great epidemics takes place?—Yes.

28. The medical department of the Privy Council, under that Act take entire charge of the matter?—Yes, so far as regards the medical relief and the arrangements for medical supervision. All those arrangements which arise out of the epidemic are under the central control of the medical department of the Privy Council, but are administered by the

board of guardians, that is to say, by the local authorities; but in so far as there is a central function connected with those duties it is the function of the medical department of the Privy Council. The Home Office exercises no special functions in those cases.

29. Supposing that either a medical officer sent down by the Privy Council, or the medical officer of health, or practically, the central authority of the Privy Council, thought that for the restraining of an epidemic it was necessary to undertake some large works, what must he do?—He must represent it to the local authority, who have powers for the purpose. If the works which he thought necessary were works of sewerage or of water supply, he would represent this to the sewer authority. If the place had not a corporation or body of improvement commissioners the work would belong to the vestry of the parish, or a committee of the vestry,. I will take the case of a village; he would have to represent to the vestry that the health of the place rendered necessary the construction of those works, that they had power to construct those works, and to borrow money for the purpose; that they had neglected to do so, but must not continue to neglect it, or that a complaint would be made to the Home Secretary, who would have compulsory power to act.

30. (*Mr. McClean.*) Would your scheme altogether do away with the Medical Department of the Privy Council?—Yes.

31. It would cease to exist?—It would very probably cease to exist under that name. Its duties would, in fact, be transferred to a department of the Home Office.

32. (*Mr. Powell.*) I presume that in the reconstitution which you suggest you would include any Acts affecting public health, and would transfer the powers of them to the Home Office. For example, I observe that the Alkali Act is worked by the Board of Trade?—Yes, I should do so, on the same principle.

33. (*Mr. Hibbert.*) Would you include the registration in connexion with vaccination in the transfer to the Home Office, or to any central body?—Yes, in so far as it is now conducted under the superintendence of the Medical Department.

34. Do you think that the transfer of the management of the whole of the Registration Acts would be too large?—I do not feel able to offer a suggestion on that subject from my own knowledge. I believe that at present the Registrar General's office is in connexion with the Home Office.

35. It is a separate department?—Yes, but still the Home Office is at the head of it.

36. (*Mr. Cave.*) Does the water supply of a district come under the Local Government Act Office?—The local boards have powers of water supply. If they borrowed money for that purpose they must come to the Home Office for sanction.

37. Has not the water supply of districts been taken up in some cases by the Board of Trade?—The Board of Trade have certain duties with regard to inquiries; for instance, a complaint against a water company by a certain number of householders is investigated by the Board of Trade: they exercise duties of that class.

38. Have not the Board of Trade promoted bills for the express purpose of supplying districts, such as the Lee River Bill of last year?—I am not practically aware of that; in the metropolitan district they might do so.

39. Comprising in fact the whole watershed of the River Lee?—Yes; that I presume was a duty coming to them from their connexion with the Metropolitan Water Act, and not a general function.

40. Should you not consider that that, as far as it goes, raised a certain conflict of central authority?—I should say so. It seems to me that such a duty as that would naturally fall to the Home Office, upon the same principles as those which I have already mentioned.

41. With regard to the purification of rivers, and especially the prevention of the refuse from gasworks being poured into them, have not the Board of Trade a jurisdiction over gasworks in the metropolis?—That I do not know. My duties have not led me practically to study the Metropolitan Acts; we have no duties in the metropolitan district, and therefore I am less acquainted with the Metropolitan Acts than I am with the General Acts which relate to the rest of England. The metropolis is generally legislated for specially, and it so happens that we are always excluded.

42. If you were told (which is the case) that legislation with respect to gasworks, and the inspection of gasworks, was under the Board of Trade, should you consider that that might lead to a conflict with the central authority in consequence of what, in other respects, belonged to the Local Government Office?—I could conceive such a conflict, but I may say that the size of London might render necessary special arrangements for these matters. I mean that the department for administering the matters of which we have been speaking, for the country at large, might not be able, without special machinery for the purpose, to deal with London. London is almost like a second England.

43. That would suggest another question of a different kind in making recommendations with reference to a central authority, and would be, in your mind, to recommend a central authority for all these questions for London, putting on one side the Home Office, the Board of Trade, and the Privy Council?—My recommendations must be understood as having reference to the rest of England. I have not had London in my view in what I have said, and I would rather not express an opinion upon that point. I think that persons who have had special experience of the needs of London in those matters should be examined on those points. My evidence must be understood with reference to my field of duty, which is the rest of England, and not London.

44. With respect to the water supply, leaving out London altogether, could not you imagine a great conflict of central authority in consequence of the central authority of London having to go far into the country with its jurisdiction with regard to water supply?—I can quite understand that. Indeed I may say that as respects the sewerage of London and the adjacent districts, I have very considerable experience of the difficulties which arise. The arrangements for the sewerage of London are closely calculated for the needs of the metropolitan area proper, and almost all the districts around have difficulties with regard to the outfalls, they being unable to avail themselves of the London outfalls, and at the same time finding that the London arrangements take their natural outfalls, so that all the districts surrounding London are now endeavouring to get leave to communicate with the London system of drainage.

45. Would not that point to a central authority, comprising London, rather than to having a central authority for the metropolis?—*Pro tanto* it does so.

46. With regard to animals, have you any jurisdiction in the Local Government Act office, with respect to cattle plague or kindred diseases?—None.

47. But you have, I think, a jurisdiction with regard to the diseases of animals, which arose before the cattle plague?—None. The Acts which have been administered through me have had no reference to diseases of animals at any time.

48. Have you a jurisdiction with regard to an animal which is kept in such a condition as to be injurious?—That is a nuisance. We have no authority as to that, but the nuisance authorities have jurisdiction in that case, and we might deal with it on an appeal under the 49th section of the Sanitary Act in case of default by the local authority; but that would be merely from default by them in the administration of the Nuisances Removal Act, and not as relating to an animal. If an animal was the subject of the nuisance it would be a mere accident.

49. In the case of default by the local authority in not taking notice of an outbreak of the cattle disease,

Tom Taylor, Esq.

26 April 1869.

would that come under the Local Government Act Office?—The terms of the Nuisances Removal Act are "Any animal so kept as to be a nuisance or injurious "to health," that certainly refers not to the spread of disease among animals. I presume that it means so kept as to be a nuisance or injurious to the health of human beings.

50. Then you do not think that in any case neglect on the part of a local authority under any circumstances to stop an outbreak of cattle plague, would come under the Local Government Act?—I should think not.

51. (*Lord Robert Montagu.*) With regard to the central administration of the sanitary laws, will you go seriatim through those acts, and state what office puts each of them in operation. In the first place the Quarantine Acts I believe are put into operation by the Privy Council and the Board of Customs?—Yes.

52. The Vaccination Law I believe is put into operation by the Privy Council conjointly with the Poor Law Board; the Burial Acts by one branch of the Home Office, and the Local Government Acts, for the drainage of towns and villages, by another branch of the Home Office?—Yes.

52*a*. The Nuisances Removal Act is put into operation by the Poor Law Board, is it not, through the boards of guardians?—So far as the boards of guardians are in communication with the Poor Law Board, they administer the Act. The Poor Law Board themselves have no functions except as having the general control of the boards of guardians. No central authority is named in the Nuisances Removal Act.

53. The Diseases Prevention Act is put into operation by the Privy Council, also through the boards of guardians?—Yes, generally.

54. The Alkali Works Act is put into operation by the Board of Trade?—Yes.

55. And the Sanitary Act is put into operation partly by the Home Office, and partly by the Privy Council Office, is it not?—I do not think that the Privy Council Office have any functions under the Sanitary Act. There are certain portions of the Sanitary Acts relating to certain matters which may come within the jurisdiction of the Privy Council, namely, medical matters, hospitals, and so on.

56. Do not you consider that there was a great conflict of jurisdiction between the Home Office and the Privy Council Office with regard to the case of Terling last year?—Yes, but it was a sanitary inquiry made by the medical department of the Privy Council, not under the Sanitary Act but under another Act which gives them a power of sanitary inquiry; and of course the appeal was to us under the Sanitary Act. Our inspector who went down there states that in that instance a complaint was made to the Medical Department against the guardians of the unions for neglect, and a complaint was also made to us under the 49th section. The Medical Department called our attention to it; the complaint was in fact made by the Medical Department to us.

57. Did not the Privy Council Office ask the Home Secretary to put an order in force under the Sanitary Act?—Yes, under the 49th section.

58. And did not the Home Secretary take three weeks to consider the subject, and to learn the case, before the Privy Council Office could get an answer?—It is very odd if he did so; I do not know. Perhaps on that point you will ask the inspector who went down from our office.

59. What office has the charge of Acts relating to the adulteration of food?—Certainly not ours.

60. Not the Home Office?—Not the Home Office.

61. Is not that left entirely to the local authorities?—Yes, as far as I know.

62. (*Lieut.-Col. Ewart.*) Are you aware under what central authority the Contagious Diseases Act is administered?—I imagine that it is administered under the War Office for the army, and under the Admiralty for the navy. It is a matter specially relating to the health of the soldiers and sailors.

63. If you had one central authority for health purposes would you bring the administration of the Contagious Diseases Act under it?—It would appear that there ought to be a co-operation between the army and navy departments, and that central authority in respect of that matter; but I think that that is a point upon which probably the medical officer of the Privy Council would be a better person to give evidence than I should. My special experience has not been upon medical questions, but rather upon local improvements.

64. (*Chairman.*) Supposing that all these subjects which have been mentioned were placed under one central authority, namely, the subjects of Local Sanitary administration, Nuisances Removal, Sewage Utilization the Medical Department including Quarantine, and likewise Diseases Prevention, and other subjects, I presume you would think it necessary that that central authority should have a larger staff for the purpose of superintending all these various processes?—They are all now provided for by different staffs, and the probability is that on the whole the staff would not have to be larger—the staff might even be smaller; it is a consolidation of duties, and *pro tanto* the tendency would be to diminish the office staff.

65. When you said in answer to Mr. Cave that the metropolitan administration might be too large for the Home Office to superintend, I presume that you did not by that mean to express any opinion in favour of these various administrations of the same kind throughout the country being under different departments, such as the Home Office, the Board of Trade, the Privy Council, and the Poor Law Board?—No.

66. But you meant to say that the central authority, whatever it was, must be made large enough to superintend these various administrations.—I meant to say with regard to London that if London was included it would probably necessitate an increase of staff.

67. What you meant to express was an opinion in favour of the necessity of an increase of power, but you did not express any satisfaction with the variety of central authorities under which these similar administrations are now placed.—Certainly not. The tendency of my evidence is towards unification of central authority.

68. We will now proceed to the construction of the local authorities. Will you state what change was brought about in the local authorities of towns by the Act of 1858.—That Act is the Local Government Act, namely, the Act which has taken the place of the Public Health Act of 1848, and which may be considered as the general code of Town Improvement Law. Under the Act of 1848, the General Board of Health brought the Act into operation. Where the mortality exceeded a certain proportion to the population in a certain number of years, they had power to send an inspector to hold an inquiry, and if they thought proper to put the Act in force by an Order in Council, or by a provisional order,—that is so say by an Order in Council where there were no local Acts in force, and by a provisional order where there were local Acts in force as to matters which required to be dealt with. The general board exercised that power in many cases where there was strong local opposition, and there was a great collision between the local authority and the central authority, in consequence of that power of applying the Act. Many places resisted the application of the Act, and did so successfully. Some places prevented any provisional order being even introduced into Parliament, others caused provisional orders which were introduced into Parliament to be thrown out. When the Act of 1858 was passed, the machinery for bringing it into force was changed, and the Act was no longer applied by the powers of a central authority, but it was adopted by a resolution of the locality itself, where there was a corporation, by resolution of the town council, where there was a board of improvement commissioners, by resolution of the Board of Improvement Commissioners; and in other cases, where there was no constituted local authority,

by a resolution of a public meeting, or by a poll, on such a resolution. That is the great leading distinction between the modes in which the Act of 1848 and the Act of 1858 are brought into operation. When once brought into operation a local board is elected and administers the powers of the Act.

69. From 1848 to 1858 a general board in London applied the law on these subjects to localities; but since 1858 the law has enabled localities to apply it to themselves?—Yes, that is the distinction.

70. Will you now state the various kinds of local authorities which exist in different places?—In places where the Local Government Act, 1858, or the Public Health Act of 1848 (which is part and parcel of the former) is in force, the local board is the local authority. The local board in boroughs is identical with the town council. Where the Act has been adopted by a board of improvement commissioners, although exercising powers under a local Act, that board of improvement commissioners is generally the local board. I say "generally," because in some cases a corporation exists besides a body of commissioners, so that it is not universally the case. In cases where there is neither a corporation nor a body of improvement commissioners the local board is a new body elected under the Act.

71. Then at this moment, as far as respects towns, there are three kinds of local boards, namely in some cases town councils, in some cases improvement commissioners, and in some cases bodies elected under the Acts?—Yes. They are all local boards, but in one case their duties are administered as a function of the town council, and in another case as a function of the improvement commissioners.

72. There are these three kinds of local boards?—Not exactly; they are local boards of towns in three predicaments: there are three predicaments of towns.

73. There are three kinds of towns with local boards under different circumstances?—It is rather difficult to say that. It is the same local board, but there are three predicaments of towns; the local board for boroughs is the town council; the local board for towns under improvement commissioners is the body of improvement commissioners; and the local board for towns which have neither a town council nor improvement commissioners, is a local board pure and simple.

74. (*Mr. Bircham.*) The same functions are administered by a different body?—Yes, they are all local boards; in one case the town council is the local board, in another case the improvement commissioners are the local board, and in the third case the local board is the local board pure and simple. The powers are the same, it is only a question of terms.

75. (*Chairman.*) What other sorts of local boards are there in other places?—There are boroughs which have corporations where the Local Government Act is not adopted, and where the town council exercise all the powers of local improvement, as in Manchester.

76. Those are places which have special Acts of their own?—Yes. There are also boroughs in which some powers of town improvement are exercised by the town council, and others by a body of improvement commissioners distinct from the town council. That used to be the case in almost all boroughs, but in some of the large ones the old commissioners have been extinguished, though in many they still exist.

77. What are the local authorities in the rural districts?—In the rural districts you have the board of guardians, as what is called the nuisance authority, that is to say, the board of guardians administer all the powers under the Nuisances Removal Acts; and the board of guardians is always referred to in the later law upon the subject as the nuisance authority. In parishes, townships, hamlets, and all places having a separate poor rate, and a separate highway rate, the sewer authority is the assemblage of ratepayers which has power to appoint a committee, and generally does appoint a committee, who are agents of the sewer authority, either as regards all or some of its duties, according as the delegation of powers to it by the assemblage of ratepayers is absolute and unreserved, or qualified and partial.

78. (*Lord Robert Montagu.*) The vestry, or select vestry?—Yes. That body is the assemblage of, or is selected by, the rated inhabitants. In towns the local board is the nuisance authority and the sewer authority; in boroughs the town council is the nuisance authority and the sewer authority. In towns under improvement commissions, the improvement commissionres are both the nuisance authority and the sewer authority; so that the functions of the nuisance authority, and of the sewer authority and the other functions of local improvement, are generally in the same hands except in the rural districts where the two are distinct, the one being in the board of guardians and the other in the vestry, or select vestry.

79. (*Chairman.*) In the last two answers when you alluded to the Nuisances Act did you include the Diseases Prevention Act?—No, because the Diseases Prevention Act is only put into force on particular occasions.

80. Is not the administration of that Act in the same hands as the administration of the Nuisances Removal Act?—Yes, it is everywhere in the hands of the boards of guardians. Even in towns where you have a local board, and in towns where you have a body of improvement commissioners, and in towns where you have a corporation, the authority for the execution of the Diseases Prevention Act is the board of guardians.

81. In what cases is the highway board the local board?—Wherever there is a local board under the Local Government Act the local board are *ex officio* the highway surveyors; the local board manage the roads of that district.

82. Are there any cases in which under the Nuisance Act the nuisance authorities possess the powers relating to highways?—Not now; that part of the Act has been repealed.

83. Can you give us a general idea of how you would simplify these great varieties of local boards?—Generally I may state that there has been no confusion with regard to local boards. The fact of some towns being boroughs, and some being places with bodies of improvement commissioners, and some places being without either one or the other, does not create any confusion. The local board is a local board, and you could not simplify the law as far as these matters are concerned.

84. That is to say in towns?—In towns.

85. Even in that case might you not simplify the nomenclature, by not calling the same board sometimes a local board, sometimes a nuisance authority, and sometimes a sewer authority?—Practically I do not think that any difficulty is created by that. The local boards exercise certain functions under the Nuisances Removal Act, and they are merely called the nuisance authority for general convenience; but they act as local boards. I do not think that there is any confusion from the different names, as far as regards towns. There are towns which have no local board at all, but which are under private Acts.

86. I will extend the question generally, and will ask you as to the simplification of all local authorities.—I am not prepared to say that you should extinguish the distinct local administrations existing under local Acts. You are gradually doing it, but I do not see that you need force that process more than circumstances are naturally forcing it.

87. Will you proceed to offer any suggestions which occur to you with regard to a simplification of local authorities in rural districts?—That is the greatest difficulty in all these Acts, namely, the question of what local authority is to administer them—whether the same authority or a different authority is to administer the Sewerage and Nuisance Removal Acts. I find it extremely difficult to determine in my own mind what the local authority for rural districts should be, or whether circumstances will render it possible to put all the powers, both of sewerage and of the removal of nuisances into the hands of one and the

Tom Taylor, Esq.

26 April 1869.

same local authority. The Legislature has tried both forms of authority; it has sometimes vested all the powers in the hands of guardians—at other times it has vested all the powers, as far as it could, in the hands of what you may call vestries, that is to say the parochial, as distinct from union authorities. The result has been disappointing in both cases. When you had the union authorities you found the administration of the Act in many cases neglected. You found them supine in many cases, and in other cases active. When you had the authority concentrated mainly in the hands of vestries, you found the same thing; but as the vestries were of course infinitely more numerous than the boards of guardians, and far less completely organized, you found cases of neglect bearing a larger proportion to the cases of activity, than you did amongst the boards of guardians. The guardians in many cases objected extremely to discharging these duties, so that generally, I may say, that the result of following both a system of union authorities, and a system of parochial authorities, has been one in a great degree of disappointment. You have not yet hit upon a good working authority for rural districts, and I may say that I think that it is a most difficult problem in all practical legislation to find a good working authority.

88. Have you any suggestion to make with regard to the combination of local authorities for particular objects which affect more than one locality?—I think that there is a very strong and pressing need for the power of uniting rural authorities for the purposes of sewerage, and water supply. I think that in many cases it is impossible to solve the difficulties of the problem of sewerage without a union of authorities, and that in many cases it is very difficult to bear the expense without a union of rural authorities, and that there ought to be a power vested somewhere of uniting such authorities, especially when it becomes obvious that their united action is necessary either for complete sewerage, or for proper water supply.

89. (*Mr. Clive.*) How far is the Local Government Act now adopted?—It is now very widely adopted. There are 671 districts under it, in England, of which 103 came under the Public Health Act between 1848 and 1858, and 568 came under the Local Government Act from 1858 to 1868.

90. What proportion would that be of the whole, taking towns with a population of above 3,000?—I am not prepared to say that at present, but I will have that made out. The comparison might be rather a misleading one, because a great many of our districts are not town districts proper, they are semi-rural. But even in the places where the Local Government Act is in force, there are 114 places which at the last census had a population of 3,000 or under. The total number of places under the Local Government Act, and therefore under the Local Government Act Office is 671, of which there came under the Public Health Act from 1848 to 1858, 103; and under the Local Government Act from 1858 to 1868, 568. I find that of these 387 have borrowed money for one or more of the purposes of the Act.

91. These local boards are now all corporations?—Yes.

92. In the event of there being an indisposition in any district to form a local board is there any power to compel it?—There is no power of compelling a district to form a local board.

93. And in the event of the local boards being disposed to go too far, is there any power to prevent it, for instance, in the case of sewerage?—Only indirectly; they have to come to the Secretary of State for power to borrow money.

94. (*Lieut-Col. Ewart.*) Has the central authority now any power to enforce the combination of an outlying district near at hand with an existing local authority such as a town council, which has a certain jurisdiction?—The Secretary of State has no power to enforce such a combination. If the local authorities of two adjacent districts wished to unite their districts they could do so by a provisional order, and then if the provisional order was assented to by a majority of the inhabitants of both districts added, it would become law; but if the consent of the majority of the ratepayers was refused, it could not become law, and it could not be introduced as a provisional order into a confirming bill. The Secretary of State has no compulsory power.

95. It must be an agreement on both sides and voluntary?—Yes; and it must be supported by an absolute majority of the ratepayers.

96. Are you aware whether that has been done in any cases?—Yes; it has been done in many cases; generally speaking by a small outlying population being added to the district of a local board; but in many cases where it is very much wanted, and where it has been very much urged by the most long-sighted of the population, it has been resisted by the majority. In all cases where they are afraid of its increasing their rates they resist it.

97. Has the central authority any initiatory power whatever?—It has no initiatory power properly so called; it must have a petition from the locality; sometimes it may suggest such a petition being sent up, so that practically we may become the initiatory power, and if they write to us for information as to how to set about it, we tell them what to do, but otherwise we have no such power.

98. (*Dr. Acland.*) I did not understand from you whether you think it desirable at present to take any steps for the universal adoption of the Act in all districts which have not got powers equal to those of the Sanitary Act?—I should myself prefer to leave that to the operation of circumstances, which are tending in that direction.

99. Can you state the area which you believe to be the best in the case of combination of rural districts for sanitary purposes?—If I had the power to parcel out England for these purposes I should be better able to answer your question, but I must answer it with reference to the state of things already existing.

100. The reason why I put that question was because you spoke of the awkwardness of the existing law with respect both to parishes and to unions. Have you any definite opinion as to whether either of those areas is the best, or whether you could devise a still better?—One of those areas is certainly a bad one; parishes are very old divisions of the country, and it is impossible to say how or why they were formed. Unions I presume were generally formed upon considerations of rateable value and population. In neither case of course was there any consideration of natural conditions of local improvement such as drainage, or water shed, or water supply. If one were now arranging England for purposes of local improvement, considerations of watershed and water supply are among the first which one would take into account, but they have not governed any of the existing divisions of England.

101. I understand from that answer that it is a sort of haphazard arrangement which has put the carrying out great sanitary laws into the hands of these bodies respectively, and that it may, or may not, be adequate to the purpose?—Quite so. Cities have in some degree a natural coherence—they have been formed in obedience to some law of natural convenience, situation, or watershed, or possibly water supply—but in the case of rural districts, it is, as you say, quite a matter of haphazard. Perhaps I should state for the information of the Commission that there is a power of forming new districts both under the Local Government Act, and under the Sanitary Act, that is to say, districts which have not now any existence. If the population living within any boundaries whatever can find one-tenth to petition for the settlement of boundaries for the purposes of the Local Government Act they can petition the Secretary of State, who, if he thinks the boundary locally formed a good one, may give it effect by an order published in the London Gazette, or he can reduce the boundary, and set it forth as modified, but he cannot increase it. Therefore for the purposes of the Sanitary Act he can

form a district upon petition which is not conterminous with any existing district: if the inhabitants petition him to do so, he can carve a district out of several existing parishes. If one-tenth petition in the case of the Local Government Act he forms a district, and then the ratepayers living within that boundary vote whether they will have the Act or not; he merely consolidates the placé in order that they may express an opinion as to adoption of the Local Government Act.

102. (*Mr. Clive.*) If they do not confirm his view the whole thing drops?—Yes, under the Sanitary Act the case is not the same. Upon a petition of one-tenth of the inhabitants the Secretary of State can settle a boundary, not for the purpose of the inhabitants expressing an opinion, but for the purpose of forming a district.

103. (*Dr. Acland.*) Then I understand that although there is the power now of superseding districts, which I have ventured to call haphazard districts, the carving out new districts even at the present day, rests upon the good sense and friendliness of the inhabitants without even the power of suggestion from the Central Government as to what would be the best districts?—The inhabitants form the boundary in the first instance, and the Secretary of State may modify it and reduce it, but cannot enlarge it.

104. But there is no power in the central authority of expressing the best way in its opinion of making that arrangement—you must wait for the local parties?—That is so.

105. (*Mr. Bircham.*) You have spoken of the Improvement Acts in towns, and of the jurisdiction of the Local Board in those cases. Do the Improvement Acts over-ride the Local Government Act, or *vice versâ*?—The Improvement Acts as a rule over-ride the Local Government Act, but there is a power of getting them modified by a provisional order.

106. There is no certain uniformity of jurisdiction where an Improvement Act obtains in a town?—No; until the Improvement Act is modified by an order it over-rules the general Acts in matters provided for by both.

107. And that uniformity had to be initiated by the locality?—Yes; but whenever a town having a local Act adopts the Local Government Act, it very soon comes for a modification of its local Act. We do not find practically that that is a very serious difficulty.

108. Do you always find that the areas within the jurisdiction of a board of health, and of the local trustees, are coterminous?—Not always; we have had difficulties arising from that circumstance.

109. You have spoken of the guardians in rural districts being the nuisance authority—that is not universally so is it—Has not the Sanitary Act of 1868 continued the board of guardians as the nuisance authority for certain purposes, and conferred upon the sewer authority the powers of the nuisance authority for certain other purposes?—That is so with respect to privies and cesspools.

110. Surveyors have some jurisdiction at Common Law with regard to the drains?—Yes, road drains.

111. Where the Local Government Act obtains, all jurisdiction over roads goes over to the Board of Health?—Yes.

112. And it is so probably, because it was foreseen that nuisances in drains in roads would be conveniently in the same hand as nuisances in connexion with drains generally?—Yes.

113. But in rural districts that is not so?—It is not.

114. The sewer authority has jurisdiction over drains to a certain extent, and the surveyors have that jurisdiction to another extent?—Yes.

115. Have you had any experience of difficulty where the guardians have been applied to with respect to a nuisance, which has turned out to be rather under the authority of the Board of Surveyors?—We have frequently had questions arising as to whose authority it was under.

116. The present law is, therefore, so ill defined, that it is uncertain in some instances whether a particular nuisance is within the jurisdiction of the Board of Surveyors, or within the jurisdiction of the nuisance authority, namely, the guardians?—That is to say as to which should undertake measures for its remedy?

117. Yes.—If the nuisance authority were anxious to do their duty they could in all cases get an order of the justices against the owner or occupier, according as the duty of removal lay upon one or the other; otherwise, *i.e.*, if the author of the nuisance could not be found, they could get an order from the justices to do it themselves. The case which you speak of is where one or both authorities are unwilling to do their duty.

118. But still there are divers authorities with regard to the same subject matter?—Yes.

119. Have you had any experience of cases where a district has been formed and where a parish has been in one district for the purpose of its roads, and in another district for the purpose of its poor, so that the guardians have been acting in one direction, and the board of surveyors in another?—I can easily conceive such a case, but I have not had practical experience of one.

120. You said that the action of guardians, and of vestries, respectively with regard to health matters in rural districts was unsatisfactory. Has it occurred to you to consider how that might be remedied, and what change of jurisdiction there might be?—I confess myself to be extremely puzzled on that point. I have never been able to satisfy myself upon it.

121. Have you observed that sometimes the disinclination to act arises from the desire of parties to avoid offending their neighbours, which tells against the local jurisdiction?—Very much. We continually find complaints on the part of persons who are willing to exert themselves, but dare not, for fear that they may offend the most influential man either on the board of guardians or on the vestry.

122. Whereas the principle of the Local Government Act is, that it must be invited by the locality, the principle of the Sewer Acts is that they are universally applicable and compulsory?—Yes.

123. (*Mr. Powell.*) Recent Acts of Parliament have conferred upon local authorities certain powers without their districts; do you find that practically those powers have been exercised in such a manner as to do away with the great inconvenience which arises from the boundaries being determined without reference to the watershed?—They have diminished those inconveniences.

124. Have those powers been put in force so as to be of importance?—Certainly.

125. There is one case of local authority which I did not understand you clearly to mention, namely, where you have a corporate borough, and a district beyond, do you find that there is any friction in that case?—Yes, there have been conspicuous cases of difficulty there. In one case, for instance, we had a parish adopting the Act, which included a small corporate borough; the small corporate borough would not adopt it, but the parish, including the small corporate borough, adopted it. A question of law was raised, and the adoption was held to be legal. There has been a constant conflict there in consequence. The place I refer to is Lymington, in Hampshire.

126. Do you think that anything which Parliament could do would remedy that mischief?—I doubt it, because it is so peculiar a case.

127. Have there been any cases where local boards have been erected, and where the Acts have lain dormant?—There have been one or two cases of that kind. I remember one particularly at Hitchin, where the Act has been dropped in consequence of local difficulties as to questions affecting the right of compensation, and threatened actions have led everybody in the district to refuse to become a member of the local board, and therefore the Act has fallen into

Tom Taylor, Esq.

26 April 1869.

abeyance, and a receiver has been appointed to receive the rates, and to pay the expenses of the works carried out; so that there is no local board.

128. Do you not think that there should be some provision for compelling the erection and the continuous action of a local board?—I think that something of that sort is wanted.

129. Have any complaints been made as to the mode of election. For instance, it is not necessary that there should be any register or list of voters, that is held to be discretionary in the chairman?—I have found a great many questions to arise out of the elections, and complaints by people who have imagined that it has gone unfairly with them; but I cannot say that there has been any general *consensus* in that respect. There have been many cases of individual complaint and constant cases of question and difficulty.

130. Is it not expedient to have such a change in the law as shall provide for a list of electors similar to that which exists in the case of parliamentary and municipal elections?—Improvements might be made in that respect.

131. Do you say that notwithstanding the multiplicity and confusion of local Acts, provisions exist for getting rid of them, and that those provisions are so put in force that no further legislation is neccessary?—I think that the provisional order system works to that effect, and on the whole works well to that effect.

132. And you think that no further change is required.—I think not. I think that the provisional order system, if properly carried out, works well.

133. You are of course aware that the sewer authority, as defined in the Act of 1865, means certain bodies in that schedule, and that in 1867 the same expression means the same bodies, and also the local board.—Yes.

134. Would you not do away with that anomaly?—That is one of the points which the consolidation of the Acts would bring about. Practically the inconvenience is not great, but there is an apparent confusion of the Acts which it would be desirable to amend by consolidation.

135. A parliamentary paper published in 1867 contains a list of the districts where the Public Health Act of 1848, or the Local Government Act of 1858, or both of them, have been in force, with the date when such Act or Acts were adopted, and as far as possible the population in 1861.—Yes.

136. And subsequently a report appeared from the Local Government Office carrying out that information to the present time?—We make a return every year, but we have not specifically continued this return. It would be easy to supply the information.

137. Could you supply us with the documents showing the population and the rateable value under the authority of this Act of Parliament?—I have no doubt that we could do so. A cheap little book called "The Board of Health Officers' Almanack and Guide" gives you a list of all the places, and the populations, and the officers, and so on. That book is published by Knight, of Fleet Street.

138. Could you supply us with that information?—I have no doubt that I could.

139. (*Mr. Hibbert.*) You seem to make a distinction between rural districts and towns and parishes with a separate poor rate. I suppose that rural districts are merely composed of rural districts?—I said districts having a separate poor rate, because that is the definition of a "parish." In some cases there are peculiar local divisions.

140. What do you mean by local districts?—I mean districts under the same sewer authority.

141. Do you mean a combination of parishes?—No. I meant, for instance, sometimes a chapelry, which will have a separate poor rate. Those chapelries would betreated as parishes for the purpose of sewerage, and the Sewage Utilization Acts.

142. In the case of parishes and townships with a separate authority, who are the sewer authority?—The vestry, that is to say, the body of ratepayers.

143. And who are the persons to exercise the powers of the Nuisance Removal Act?—Generally the guardians.

144. Therefore you have two different bodies in the same township.—Yes.

145. Do you know from your own knowledge whether it is not the case that those powers are very much left by boards of guardians to an individual guardian of the place?—Yes. They have power to appoint a committee, and they generally appoint a guardian of the place, who acts on behalf of the board.

146. So that it is after all done by a local person.—Yes. Very often he is an active man with reference to the particular parish.

147. In the parish is it not the case that there are several persons annually elected for different purposes? In the first instance are there not the surveyors of highways who are elected annually?—Yes.

148. What powers have they with respect to sewers or drains?—Merely the power to which Mr. Bircham alluded, over drains running by the side of or adjacent to roads.

149. Have they no power to execute any sewerage?—Not for sewerage as such; only in connexion with roads.

150. Nor to borrow money for that purpose?—None.

151. That must be done through the vestry?—Yes.

152. You have also other public officers in the parish; you have overseers who are annually elected?—Yes.

153. Would it not be possible annually to elect a board who could perform all those offices instead of having them performed separately by the different individuals. I mean that a parish should annually elect a board who should act as a board of overseers, as surveyors of highways, as the sewer authority, and as the nuisance authority. If so, would there not be a chance of getting more done than there is now by having the work performed by separate officers? There is one difficulty which suggests itself to me, and that is that in the rural districts, the farmers who are most interested in the district and the roads, are generally the people most opposed to all sanitary improvements.

154. If you had an elective board of that kind would it not be possible to have a certain number of magistrates living in the locality *ex officio* members of the board, just as they are now *ex officio* members of the boards of guardians?—I have sometimes heard it said that the *ex officio* element on a board of guardians has not made its presence sufficiently felt.

155. Are you aware that a similar authority was brought into operation under the Public Works Act in Lancashire, in the smaller districts?—I cannot speak to that practically. Mr. Rawlinson had the working of that Act, and the Commission will find that he is able to give information on that point.

156. (*Mr. Cave.*) In the rural districts, are not the justices now a quasi central authority with regard to all these Acts?—They issue orders under the Nuisances Act.

157. Cannot they compel a reluctant local authority to carry out works?—If a local authority made complaint to them, or if individuals made complaint to them, they could do so. Individual ratepayers have that right, and the justices can issue an order for the abatement of a nuisance on private premises, on complaint of an individual ratepayer, but the difficulty is that very often the local authority will not move, and unless it is a case of nuisance on private premises, no individual has a right to move, so that the execution of the Act still very much depends upon the willingness of the local authority to do its duty.

158. In the case for instance, of an open drain which ought to be covered in, could not a certain number of the inhabitants petition the justices?—No,

unless that drain existed on private premises, and then any ratepayer could make his complaint; but in the case of a public nuisance the step must be taken by the public authority, except in the case of a noxious trade. In the case of a noxious trade the nuisance authority can act on the petition of a certain number of persons, but still if the nuisance authority refuse to act, I do not know that any power, except an appeal to the Secretary of State could compel them to do so. There is an appeal to the Secretary of State.

159. Is there no power now by mandamus?—There is no statutory power; it would be a question of law.

160. In the case of the justices making an order where a nuisance existed on private premises, would they not have authority as far as those private premises went, and no further?—Yes.

161. Then, in fact, though the justices are a *quasi* authority, they are insufficient and unsatisfactory?—They must be set in motion by the local authority. I am not prepared to say that the justices do not do their work efficiently when they are set in operation.

162. Is it not impossible for them to act in exactly the same way as you, for instance, could act, in sending down orders for the abatement of nuisances generally?—Yes; they have not the initiatory power, and they must be set going.

163. By the Act of 1848, had the central board any initiatory power as far as the ordering of works to be done went, or could they only insist upon the formation of a board?—They could only enforce the powers of the Act.

164. But they could not themselves order anything to be done?—No.

165. You said that local boards could unite among themselves to form one district, or more than one, if they pleased?—Yes; on such conditions as were approved by the Secretary of State.

166. Cannot they also unite with other bodies, such as drainage trustees or turnpike road commissioners?—They cannot extinguish turnpike trustees; they can make agreements with them as to the taking upon themselves of the maintenance, repair, cleansing, &c., of parts of the roads which they control.

167. Cannot they take a portion of their territory for the purpose of drainage?—Yes, by agreement.

168. And confirmed by provisional order?—No provisional order is required in the case of an agreement with turnpike trustees.

169. You know the case of the Worthing and Lancing Road?—That is quite a special case. We have been obliged to deal with that case partly by provisional order, and partly by clauses in the confirming bill. It is a case in which it is necessary to protect certain lands from the sea.

170. It is partly for the purpose of sea defences, and partly for internal drainage?—Yes; but mainly for sea defences. That is entirely an exceptional case.

171. (*Lord Robert Montagu.*) I will put to you a case which might arise, in order to exemplify the collision which there is between the central authorities. We will suppose an emigrant ship in port and just about to sail, and an infectious disease breaking out in her. She would be under the direction of the Colonial Office by virtue of the Passengers' Acts.—Yes.

172. She would be under the Medical Department of the Privy Council by virtue of the Quarantine and Sanitary Acts, and if there was any question of sanctioning or ordering expenditure she would be under the Home Office by clause 49 of the Sanitary Act, and under the nuisance authority of the nearest part of the port by the Sanitary Act of 1866.—Yes.

173. And the ship would be liable to penalties for infringing the rules of any one of those authorities.—I do not know how far the ship could become liable. Under the 49th section of the Sanitary Act we are empowered to deal with a recalcitrant local authority.

174. (*Mr. Bircham.*) You have had no experience of that.—I have not.

175. (*Lord Robert Montagu.*) You said that a collision arose between the central and the local authorities with regard to the Act of 1848.—Yes.

176. Did you mean that it was because the application of the Act was universal?—No. It was because the central authority had power to put the Act in force by Order in Council or provisional order, and in some cases did so against the will of the local parties.

177. To remedy that the Act of 1858, which takes the power of initiating from the central authority and gives it to the local authorities, was passed.—Yes.

178. You also said that very often the local authorities who adopted the Act were supine, and in many cases they did not adopt the Act.—Yes.

179. But if all the Acts were consolidated and administered by one central authority, would not the same inconveniences arise; either there would be a conflict between the central and the local authorities, or else we should run the risk of the Act not being universally applied?—Yes, unless you made the Act compulsory instead of permissive.

180. Then if we consolidate the Acts and give the administration of them to one central authority, we shall still require something else which shall evade these two difficulties?—The Sanitary and Sewage Utilization Acts now in force, give to all local authorities in towns great powers for sewerage and water supply, and impose upon them duties with respect to those things which put them on an equal footing with boards under the Local Government Act as to some most important powers. Every local authority in towns is already under some of the most weighty obligations which would be laid upon it by the Local Government Act.

181. These powers are not put in force by the local authorities very often, are they?—No.

182. And, therefore, we should require a third power in order to get these Acts put in force?—Yes.

183. Something which should have the nature of a superior authority to compel the local authorities to exertion, and which should also act as a buffer to prevent a collision between the central and the local authorities?—Yes, if you could contrive something of that sort.

184. You have spoken of the necessity of the union of local authorities for sewerage and water supply?—Yes.

185. Do you mean that there should be a compulsory union?—Yes; I believe that in some cases you would want it.

186. Such as the power which the Home Secretary now possesses under the Fishery Acts to place either an estuary, or a whole river basin under one local authority?—I am not acquainted with that.

187. But at any rate you would put the initiative into the hands of the Home Secretary?—The initiative should be in some power distinct from the local authority.

188. On the ground that an injury to a town might arise outside of the jurisdiction of the local authority, by a town higher up the river, for instance?—Yes.

189. Then such a large authority as that might serve the purpose which I have just mentioned?—Yes, if you could contrive such an intermediate authority.

190. Do you remember giving evidence in 1864 before the sewage committee?—Yes. (*See Appendix*, p. v.)

191. Are you still of the same opinion as you held then with regard to the authority over river basins, namely, that there should be a single authority over the whole of every watershed or river basin which should have the powers of the Local Government Act, and that it should compel the local authorities to put the powers of the Local Government Act in force, and that it should also have rating powers?—You want some power of that kind, if you can get it.

192. Are you aware that the evidence of one of the

Tom Taylor, Esq.

6 April 1869.

commissioners, Dr. Acland, went to the same purpose?—I am not. (*See Appendix*, p. iv.)

193. Do you remember that the committee unanimously reported in favour of such a plan?—I believe that they did so. (*See Appendix*, p. i.)

194. (*Mr. Cave.*) With respect to harbours, has the harbour authority in any case jurisdiction over all matters of this kind, to the ousting of the general local authority of the town?—Possibly under a local Act; it would be under a local Act, if so. I think that I have heard of cases in which the harbour authority has claimed jurisdiction over the quays, and approaches, and so on, and where difficulty has been created in the case of artificial harbours.

195. At Liverpool, for instance, by the dock company?—Yes. I have no doubt that difficulties may have arisen, but I have not a personal knowledge of any very serious ones. I however have heard of such cases—I think that that case has arisen at Cardiff.

196. (*Chairman.*) Is there not in some towns a conflict between a number of old corporations of divided authority?—Yes, in towns which were passed over by the Municipal Corporations Act, the old corporations, as far as I know, are simply obstructive, and at present a difficulty is found in that respect.

197. Is not Seaford a case in point?—Yes; an old corporation exists there which has done everything which it can to job away all the property in its hands, and the only purpose to which it puts its corporate power is to divide the property between the freemen, in the shape of drink money; they have managed the small property of the corporate place most improvidently merely to acquire a little more drink money. In fact I do not see why those small corporations should not be entirely done away with.

198. Will you show the Commission what your office does under the Local Government Act, in the first instance, and afterwards, under the Sanitary and Sewage Utilization Acts?—We will take the case of a borough in the first place. We receive notice from the borough that the Act has been adopted by the town council, and we publish that in the gazette. The next thing probably which we have from them is a petition for a provisional order to alter their local Acts and thereupon we direct a local inquiry by an inspector, and we go into their local Acts. That inquiry is reported upon, and we frame a provisional order dealing with the local Acts as prayed in the petition, or as the case may be. If the objects of the petition are approved, it is done according to their wish, but there are very often modifications, sometimes more and sometimes less of the Act is repealed, than they wish. In the end a provisional order is framed, which carries out their object, more or less modified, and sometimes without any modification at all, and which is introduced into a confirming Act, which becomes law.

199. When you talk of approval, that means your own approval?—I mean the approval of the Secretary of State.

200. Practically, is it not your own approval?—No; in my experience, when any difference of opinion has arisen between me, as the executive officer of the Secretary of State, in any matter, and the locality, the Secretary of State has always looked into the matter himself and has decided it. If no difficulty arises, the matter goes on through me. Then the order is submitted to Parliament in a confirming bill, and that bill is passed and becomes a public Act, but any person who objects to the order has the power of petitioning before the bill goes into committee, and of being heard if he thinks proper in committee.

201. Are these Acts what we call Omnibus Acts, in which several cases are put into one Act?—Yes. Here, for instance, are the Acts of 1867 and 1868. Each Act has a schedule including a number of orders which relate to different places. For instance, I will take the Act of the 30th and 31st of Victoria, chapter 65, which was passed in the year 1867. It is "An Act to confirm certain provisional orders "under 'the Local Government Act, 1858,' relating to the districts of Sheffield, Derby, Sherborne, Royton, Bedford (Lancashire), Slough, Sandown, Burton-upon-Trent, West Cowes, and Accrington." Each of these orders relates to a different district, but they are all included in the schedule to this one Act. The Act is a very short one. It simply enacts that "The provisional orders "contained in the schedule hereunto annexed shall, "from and after the passing of this Act be absolute, "and be as binding and of the like force and effect, "as if the provisions of the same had been expressly enacted in this Act. This Act shall be "deemed to be incorporated with the Local Government Act, 1858, and shall be as if this Act and the "said Local Government Act were one Act. In "citing this Act in any other Act of Parliament, or "in any proceeding, instrument, or document whatever, it shall be sufficient to use the words and "figures 'the Local Government Supplemental Act, "1867, (No. 2.)'" There are ten provisional orders. The first is a "Provisional order putting in force the "Lands Clauses Consolidation Act, 1845, within the "district of the Sheffield Local Board, for the purchase "of lands by the said board for street improvements." The second is a "Provisional Order putting in force "the Lands Clauses Consolidation Act, 1845, within "the district of Derby, in the county of Derby, for "the purchase of lands by the Local Board of "Health for the aforesaid district for street improvements." The third is a "Provisional Order putting "in force the Lands Clauses Consolidation Act, "1845, within the district of Sherborne, in the "county of Dorset, for the purchase of lands by the "Local Board of Health for the supply of water to "their district." The fourth is a "Provisional Order "putting in force the Lands Clauses Consolidation "Act, 1845, within the district of Royton, in the "county of Lancaster, for the purchase of lands in "the aforesaid district for street improvements." The fifth is a "Provisional Order putting in force the "Lands Clauses Consolidation Act, 1845, within the "district of Bedford (Lancashire) Local Board, for "the purchase of lands by the said board for sewage "outfall purposes." The sixth is a "Provisional "Order putting in force the Lands Clauses Consolidation Act, 1845, within the district of the Slough "Local Board, for the purchase of lands by the said "Board, for works for flushing the sewers within "their district." The seventh is a "Provisional "Order putting in force the Lands Clauses Consolidation Act, 1845, within the district of Sandown, "in the Isle of Wight, for the purchase of lands by "the Local Board for that district for street improvements." The eighth is a "Provisional Order for "the alteration of the town of Burton-upon-Trent "Act, 1853, in force within the district of the Burton-upon-Trent Local Board." The ninth is a "Provisional Order altering a Local Act in force in the "district of West Cowes." The tenth is a "Provisional Order extending the borrowing powers of "the Local Board of Health of Eckrington."

202. You mention that as a good sample of the confirming Acts?—Yes, and it is a remarkably simple one. There is very often more necessity in provisional orders for dealing with different subjects. We have other functions, however, than this in relation to provisional orders. A petition is sent to the Secretary of State against the vote by which the Local Government Act has been adopted. He then inquires into allegations of impropriety in relation to the adoption,—either that the vote was not properly taken, as a matter of law, or that the place is not as a matter of fact, a proper place for the application of the Act. The Secretary of State inquires into those allegations, and he is empowered to dismiss them or to make an order upon them; so that the confirming of the adoption depends upon him, if there is a petition. When once the Act is brought into force, there are powers of appeal to the Secretary of State for certain purposes. In a case of private

improvement rates, where a person, for instance, is charged for the sewering of a private street, or the kerbing, flagging, and channelling of a private street, and thinks that he is charged too much, or ought not to be charged at all, he appeals to the Secretary of State, who has power to make an order. Then, whenever the local board want to borrow money on the mortgage of their rates, they must come for the sanction of the Secretary of State. For that purpose there is a local inquiry and a sanction is given by the Secretary of State upon the result of that inquiry. As a general rule a local board can only borrow a year's rateable value; but if they desire more, they must come to the Secretary of State to get power to borrow up to twice that amount, but that is only given by provisional order. The Secretary of State makes inquiry, and makes a provisional order, which is confirmed like the other provisional orders. There are other powers which he exercises; for instance, the incorporation of an adjacent outlying portion of a parish; that can be managed by provisional order. The separation of a part of a district which thinks that it had better be separated from the district, can be done by provisional order. Then there are all the modifications of local Acts, of which I have already spoken; so that our chief relations with the local board, when once established, are either through their applications for sanction to borrow money, or through their applications for provisional orders. But besides this, a power is given by the 49th section of the Sanitary Act, of general appeal to the Secretary of State in all cases of default by local boards, so that we have a great variety of appeals under that section, that power having been first given by the Act of 1866. Then we examine and approve all the bye-laws which are made by local boards. There is also a power of putting in force the provisions of the Lands Clauses Consolidation Act for the compulsory purchase of lands for street improvements, or any of the purposes of the Act; which we do by provisional order confirmed by Parliament.

203. You have described the process of adopting the Local Government Act, and also the powers and functions of certain parties in a place which has adopted that Act. Before I ask you for your opinion as to the well-working of this system, I will ask you—What does your office do under the Sanitary and Sewage Utilization Acts?—Under the Sanitary and Sewage Utilization Acts we have a certain power where a parish forms out of itself a special drainage district, which it can do; that is to say, it can carve out a district, when the vestry of the parish think that the rates ought to be borne only by a portion of the parish, and it can convert that portion into a special drainage district. An appeal is given to the Secretary of State against the formation of such a district. He can hold an inquiry, and make an order with respect to the formation of special drainage districts; that is under the Sanitary Act of 1866. He can also under the Sewage Utilization Act of 1867 form a new district, that is one which has no existing boundaries for the purposes of the Act. He can settle such boundaries on the petition of one-tenth of the people living within the boundaries of the district petitioning, just as he can under the Local Government Act. All sewer authorities, under the Sanitary and Sewage Utilization Acts, have power to borrow money for sewerage or water supply, on the mortgage of their rates, and the Secretary of State has to give his sanction to these applications. There is an appeal to him in cases of default by sewer authorities, and he can inquire into those cases. If the local authority do not do their duty after inquiry, and after the order of the Secretary of State that they shall do their duty in the particular manner complained of, he has power to appoint a person to do the duty; and not only has he that power, but he can issue his precept to the local authority to make a rate for the purpose of paying that individual for the work which he has done, and for the superintendence which he has given to the work; and by the latest Act on the subject, if the sewer authority refused to raise the rate the Secretary of State can himself appoint a person to levy the rate in their stead, although it has never come to that. So that the Secretary of State under the 49th section can take upon himself in the last resort the duties in which a local authority fails, both as regards the planning of works and the carrying out of works, and the paying of their expenses. That is a very large power, given for the first time in that Act; no such power was ever conferred by English law before, and that power has been in existence since 1866. I have here a return of all the cases in which application has been made to the Secretary of State under that section, and I will put it before the commission. The power of levying a rate was given by the Sanitary Act of 1868, which is an amendment of the Sanitary Act of 1866. There is also under the Sanitary Act a peculiar power given to approve regulations for lodging houses, that is to say, houses occupied by more than one family; that is under the 35th section. In the notice published in the London Gazette the Secretary of State declares the following portion of the Sanitary Act of 1866 to be in force, namely: "For fixing the number of "persons who may occupy a house or part of a "house which is let in lodgings, or occupied by "members of more than one family. For the regis- "tration of houses thus let, or occupied in lodgings. "For the inspection of such houses, and the keeping "the same in a cleanly and wholesome state. For "enforcing therein the provision of privy accommo- "dation, and other appliances and means of cleanli- "ness in proportion to the number of lodging and "occupiers, and the cleansing and ventilation of the "common passages and staircases. For the cleansing "and lime whiting at stated times of such premises." After the Secretary of State declares these powers to be in force in the district, the local authority may make regulations in these matters.

204. Have you completed your answer as to what your office does under the Sanitary Act?—I think so.

205. What does your office do under the Sewage Utilization Acts?—The Sewage Utilization Acts must be read along with the Sanitary Act. The Sewage Utilization Acts confer the powers, while the Sanitary Act contains the regulations as to the establishment of the authority.

206. Will you state, generally, what you find defective in this process?—Under the Local Government Act the main defects appear to me to be the want of all power of the Secretary of State for inspection. We can give powers, but we have no means of seeing how those powers are carried into effect, or that they are working for the good or ill of the district in which they are in force. We are totally without inspecting powers. Under the 49th section we can now exercise power if default is alleged. That I think is a great defect under the Local Government Act; it seems to me that we have only powers for doing half our work.

207. What is the inspecting power which you would wish to have?—The power of examining into the working of the Act, systematically and regularly, and of seeing that the Act is carried out, and how it is working; of seeing that the local authorities are doing their duty, and what is the effect of their execution of their duty on the health, or comfort, or improvement of the district.

208. Would you, then, be in favour of having inspectors who, without any local complaint, should be continually making a circuit of the country?—I think that something of that sort is wanted.

209. Have you any opinion as to the number of inspectors who would be required for that object?—I should not like to give an opinion upon that subject without full consideration. I should not like to name a number.

210. How many inspectors have you now in the local government office?—Three.

211. What is their duty?—They at present conduct all the inquiries which arise under the Local

Tom Taylor, Esq.

6 April 1869.

Government Act and the Sanitary and Sewage Utilization Acts. They go down and make an examination on applications for loans by local boards; they go down to settle boundaries; they go down to hear appeals on default, both under the Local Act and under the 49th section of the Sanitary Act. They are constantly employed in the duties which devolve upon them under that Act.

212. They are employed, in fact, by you to verify complaints which are made to you?—Yes, and also to make inquiries into applications for sanctions to loans. They conduct very often very grave and important judicial inquiries, such, for instance, as an inquiry into the propriety of granting powers for compulsory purchase of lands, or as to the legality of a vote for the adoption of the Act, or on the merits of the case, namely, whether a place is a proper one for the adoption of the Act. They have functions which may be properly called judicial, and they have functions which may be properly called engineering.

213. Am I to understand you to propose an increase of the same body of inspectors which you now have, with somewhat different functions?—I should suppose that the same class of men who would be qualified to inquire and report as to the working of the Act would be the men who would conduct these inquiries under the Act, where it is in force. Of course, if the Medical Department of the Privy Council were put under the same authority as my office, the services of medical inspectors would be available.

214. Supposing that the Medical Department of the Privy Council were placed, together with your Local Government Office, under the same office, would it still be necessary to have two sets of inspectors, one for medical subjects, and the other for general superintendence and administration?—I should expect that you might find men who were capable of dealing with both.

215. How many inspectors are there attached to the Medical Department of the Privy Council?—I do not know exactly. I may mention that I think that the great want of the central authority under the Local Government Act is the power of inspection; that, I think, is the great defect of the Secretary of State's power under the Public Health Act.

216. Are there any other defects in the Secretary of State's power in the operation of your office connected with the Sanitary Acts?—With regard to the Sanitary and Sewage Utilization Acts, I think that it is clear that the duties which are thrown upon the Secretary of State, under the 49th section, are beyond his powers, as his office is now constituted. The Secretary of State is called upon under the 49th Section to appoint persons for doing the duties of local boards; he may have to appoint a person to carry out the sewerage of a district; he has not only to do that, but he must borrow the money in order to pay the cost of those works. He must have arrangements by which he can put himself in communication with the engineer whom he appoints. He must see that the contractor does his work properly, and that the man whom he has appointed is entrusted with the money which the Secretary of State borrows to pay to the contractor. Not only that, but he must regulate the collection of rates in that district in the last resort, supposing that the local board refuses to collect the rates. Now, unless you suppose that this power is to be exercised in very rare cases, it is one which requires means and officers whom the Secretary of State has not at his command. He has no staff for the purpose; his office was never equipped for that purpose, unless you suppose it to be a power to be exercised so rarely that the Secretary of State can appoint people whom he wants for the nonce, and that he will not be hampered by a great many such applications. At present, although we only got the power of rating in 1868, the Secretary of State has appointed men to do the work in which the local authority has made default in four cases.

217. Do you suggest supplying this defect by increasing the power of the Secretary of State?—No, I should rather suggest that the function is one which ought not to be thrown upon him, and that there should some intermediate authority between him and the smaller local authority for the purpose of doing this kind of work, with which the Secretary of State is now charged under the 49th section.

218. Have you formed any opinion as to what sort of intermediate body might undertake those functions?—Either the river conservancy board to which Lord Robert Montagu alluded, or some representative body for a county, or some large territorial division, which should exercise a power over the local authorities thin its area.

219. Do you say that with reference both to towns and to rural districts?—The case would more seldom arise in towns; the difficulty, as a rule, is really with the small districts, but if a town authority did refuse to do its duty, and would not exercise the powers which the law vested in it, I presume it would be in the same predicament as a rural authority.

220. Why do you think that these functions could not be efficiently discharged by the Secretary of State if his staff was sufficiently increased?—Simply because they are not powers of the kind which he has been in the habit of exercising. He would have to create a staff for their discharge, and they do not seem to be at all akin to his ordinary work. He has no knowledge of engineers, he has no knowledge which should qualify him to select an engineer; that must of course be done by those who are more or less in contact with engineers.

221. Have you now stated generally the main defects which you see in the working of your office, with regard both to the Local Government Acts, and to the Sanitary and Sewage Acts?—Those are the great defects there. Of course there is the great defect of the want of a consolidation of the Acts.

222. Have you any defects to point out in the process of adoption of the Act before you come to the powers of your office when the Act is adopted?—Supposing no power of initiation to be vested anywhere but in the local authority, I think that the mode of adoption now followed is on the whole satisfactory.

223. (*Lord Robert Montagu.*) Have you any opinion as to which would be the best as an intermediate authority between the Home Secretary and the Local Board, whether a county board would be better, or a board for a whole river basin?—The only reason why I propose a county board is that it is a more familiar body, whereas a board for a river basin would be new. If one was absolutely free to choose, I should be inclined to think that a river basin board, or a river conservancy board would be the one most naturally fitted for this sort of work, but the reason why I mentioned a county board is that we are all familiar with that division. and that we are already familiar with the idea of representative county boards with jurisdiction over local rating.

224. Except for that familiarity you think that a board for a whole river basin would be better?—Yes.

225. For instance, in one river board there may be a good many counties, and the river may be polluted higher up?—Yes. With regard to river basins one obvious difficulty is their great size.

226. In the case of river basins and arterial drainage, would it not be better to have a whole watershed under one board, than to have it divided into eight or ten county boards, each acting independently of the other?—Mr. Rawlinson has paid particular attention to this subject, and he probably could speak with more profit upon the question of watersheds than I could. From his inquiries, as a member of the first river pollution commission, and also as having given great attention to the subject of sewage irrigation, and the utilization of sewage, I think that he could give valuable information to the Commission upon these points.

227. Is not the Thames Conservancy Board pretty nearly a watershed board?—Yes.

228. I believe that the reports of the River Pollution Commissioners are in favour of watershed boards,

are they not?—Yes, the original rivers' commission were in favour of it. (*See Appendix*, p. vii.)

229. The second commission has not reported as yet, has it?—No.

230. (*Mr. Cave.*) I think that the Lee River is the only case in which the Conservancy Board has jurisdiction over the whole of the tributaries.

231. Do you see any objection, if you adhere to counties, to the quarter sessions being what you may call the local central authority?—The only reason why I object to that is, that it comes together only once a quarter. I was rather contemplating an authority which should be continuous in its action—a paid authority, consisting mainly of paid officers giving their whole time to the work.

232. In addition to what you stated as to the duties of the central board, I think that you have also to cure defects of procedure, to intervene, for instance, in cases of defects of procedure in levying rates, and so on?—We intervene in the case of private improvement rates, but the central authority does not act as a board of appeal on rating questions; the appeal is to the quarter sessions.

233. You, I dare say, know the case of New Shoreham, in that case you intervened, the rate having been quashed by the quarter sessions, to enable the money to be raised for the same purpose in a different way?—Yes, we intervened there under our power to give sanction.

234. The rate being bad, you gave power to borrow upon a subsequent good rate?—Yes. We give our sanction to borrow upon the rates generally and not upon a particular rate.

235. For how many years in general can a board mortgage the rates?—They can borrow loans to be repaid in 30 years; that is, in ordinary cases. Where they go beyond one year's rateable value they can have their term of repayment extended as far as 50 years. That is the maximum.

236. With regard to the omnibus Acts, to which you have referred, is it the fact that in the case of an opposition to any portion of the schedule of one of these Acts the part with respect to which the opposition arises is taken out of the schedule and sent to a select committee like a private bill?—Yes. We put the cases which are opposed into a separate Act. We try to get unopposed and opposed orders together in separate bills, so as not to stop the progress of the unopposed orders.

237. It is the same as with regard to provisional orders in the case of harbours under the Board of Trade?—Yes, all the provisional orders are founded upon ours.

238. Have you found any inconvenience in the establishment of voluntary districts as regards what may be called capricious districts, in consequence of little bits of country being left between two such districts?—Yes, and in the case of special drainage districts under the Sanitary Act, the inspectors are strongly of opinion that no such special drainage district should be formed without the sanction of the Secretary of State, in order to avoid those difficulties. In some parts of England there is a disposition to cut up districts unfairly and mischievously.

239. (*Mr. Hibbert.*) I understood you to say that there are four cases where the sewer authorities have refused to do the requisite work?—There are four cases where it has come to what I call the last step, namely, the appointment of a person to do the requisite works.

240. In those cases what has the Home Secretary done?—He has appointed an engineer in each case. In one case the engineer is carrying out the works. In the second case the engineer is engaged in taking the levels and in making a preliminary survey. In the third case the Secretary of State has appointed an inspector who has made a preliminary survey and has reported upon the works required. In the fourth case the Secretary of State has just appointed an engineer who is about to proceed upon his examination.

241. I suppose that you do not yet know whether the action taken by the Home Secretary will compel the authorities to do the work at all?—In some cases they have themselves carried out the work after they have had the first order served upon them, and before it has come to the appointment of a person to perform that duty.

242. Do you think that it is likely that the work will be carried out without that appointment by the Home Office?—I should like to have another year to answer that question. There has been a disposition in some cases to throw the work upon the Home Secretary. They have said, "We cannot agree about it; "let the Home Secretary do it; we should like "him to do it: it will save us trouble."

243. If the Home Secretary, after an inquiry by an engineer of the Home Office, directed the work to be done, would it be possible then to throw the onus either upon the board of guardians of the district, or upon the magistrates of the district in quarter sessions?—Yes, you might do something of that kind.

244. I suppose that you do not object to the power of the Secretary of State being brought into action with respect to the mode in which the drainage is to be done, but that your objection is more as to the trouble of seeing that it is properly carried out?—If you impose upon the Secretary of State the duty of carrying out the work, supposing the local authority to continue recalcitrant, you have to impose upon him the management of the work for a long time, and you may impose upon him the duty of collecting the rate for 30 years.

245. Would it not be possible to leave the authorization of the work to the Home Office, and then for it to be done by the local authorities?—If you retain in the Secretary of State the ultimate power of directing the work, I think that that might be done.

246. Would not that get rid of the objection?—It would get rid of the heaviest part of the objection.

247. (*Mr. Powell.*) Have you had occasion to exercise any authority under the powers of the Artizans and Working Classes Act, with reference to the exercise of the power of the medical officer?—Yes, in one case, at a place called East Dean, in the Forest of Dean.

248. Do you think that that power has come into extensive operation?—That is the only case in which we have yet applied it; it was suggested by one of our inspectors as one result of his inquiry in the locality.

249. In the applications for provisional orders, of which you have spoken, do you find that the authorities are anxious to fall back upon the provisions of the general statutes in substitution for their local Acts, or parts of them, or that they desire to have new provisions of their own?—I think that they are generally desirous of fusing the local Acts with the general Acts; that is to say, of suppressing those portions of the local Acts which are inconsistent with the general Acts.

250. Then your evidence is that there is a satisfactory movement towards a simplification of the law upon those points?—Yes, in places under our Acts there certainly is.

251. Do you think that the Home Secretary, whom you do not think competent to deal with the 49th section of the Sanitary Act for the reason which you give, is competent to deal with such questions as appeals on private improvement rates?—So far he is competent, because an inspector goes down and inquires into that particular case of appeal; he has the facts all before him; he exercises a judgment in the matter, and acts for the nonce.

252. And you think that that appeal is satisfactory?—I think so. I do not find much complaint of the results in these cases.

253. As to confirming byelaws, do you think that a great officer like the Secretary of State can inform himself so much in each case as to exercise a discretion with respect to byelaws?—That power of course must be exercised by a subordinate. I examine those byelaws, and have a report made upon them,

Tom Taylor, Esq.

April 1869.

and the questions with regard to those byelaws are passed through me, but it is a mistake to suppose that the Secretary of State does not exercise an independent opinion of his own upon cases of complication or difficulty. I always refer these to the Secretary of State, with a full minute. Important cases do not often arise. The great majority of the cases which come before me are such as I can perfectly well settle.

254. How do you ascertain the nature of a locality. For instance, whether it is purely agricultural, or whether it contains manufactories?—Generally speaking the inspectors know the character of a district, and we can judge with their help of the character of a district. If any special question arises we have to make inquiries, but if no question arises of course we are not specially informed.

255. Do you think that any inconvenience arises from dealing by local Acts with powers to borrow? For instance, the general Act gives power to borrow for 50 years, and the local Act may give power to borrow for 100 years?—We have had some instances in which Local Acts have been applied for in order to obtain larger borrowing powers than could have been exercised under the Local Government Act, and rather improvident borrowing powers. I think that when a place has adopted the Local Government Act, it should not have power to go for a local Act, except by the special authority of the Secretary of State.

256. You think that there ought to be some restriction upon that power?—Yes. I will quote the case of Wallasey, where they have a very heavy debt, and where probably if the Secretary of State had been allowed some restrictive power he would have exercised it.

257. You have spoken of three cases with reference to rates under the Act of 1868, are they cases of any magnitude?—The Home Secretary was unwilling to appoint an officer to do the works under the Act of 1866 until he saw his way to getting back the money. One of those cases is a small case at a place called Wetheringsett in Suffolk, that does not exceed an expenditure of 300*l.* That is a case of deficient water supply, where the population has had fever decimating it for some years past. In that case there is no water supply except from ponds and ditches. The next case is the case of Epping, where a district has been created under the Sanitary Act, uniting parts of three parishes. We have there appointed an engineer to take the levels for works of water supply and sewerage. That case may involve 4,000*l.* or 5,000*l.*, or even 6,000*l.*, of outlay. Another case is Bromyard, where we have appointed an engineer to make the necessary inquiries and plans for water supply. The town council refused to do anything for the water supply of the district, and in that case 250*l.* I think has been expended for the preliminary inquiry and the preparation of plans; the work itself will probably involve 6,000*l.* or 7,000*l.* There is another case, at Southover, near Lewes, of the pollution of the Winterbourne; that is a case requiring an intercepting sewer. We have not yet had the report of the engineer as to the cost, but it will not be very much. These are the cases in which we have actually proceeded to appoint the persons to do the work. We have had a very great many cases in which we have been at the local authorities for a long time, to get them to do the work. There is a case at Saxmundham, where we have been between two and three years endeavouring to induce the local authorities to do the work, and where they have now determined to have the work done.

258. The importance of those cases is not to be measured by the three or four cases which you have stated?—No. The amount of trouble which the 49th section of the Sanitary Act gives us in the shape of inquiries and communications, and correspondence with the local authorities, is very great indeed.

259. (*Mr. McClean.*) Where a provisional order is applied for to take lands compulsorily, is it necessary to give notice?—Yes, in November, just as in the case of an application for compulsory powers under a private bill.

260. (*Mr. Bircham.*) Are you of opinion that the existence of this ultimate power on the part of the Secretary of State, and the fear of a great expense being incurred through him, does in fact bring recusants to do their duty?—I think that the Act has been beneficial in that respect.

261. Do you not think that the repeal of that power might operate prejudicially?—I do not wish to have it absolutely repealed. I should very much prefer some provision by which the power of direction should be left in the Secretary of State, and by which the executive work should be transferred to some local authority.

262. If the executive work is taken out of the hands of the Secretary of State, will not he then have to drive the local authority by the ordinary tribunals to the execution of the work?—There must be some local tribunal for that purpose. All that I complain of is that the Secretary of State is not properly furnished with means for performing the duties which the 49th section now imposes upon him.

263. In your judgment should that local authority be some fresh authority, or the ordinary local body in the district?—I mean some larger authority, but local in character.

264. You probably refer to some intermediate authority?—Yes.

265. You rather favour the idea that that should be an authority representing a river basin?—I said that if I were perfectly free to act, in a new country, that might be the determining area.

266. What suggests itself to your mind as the meaning of the word "river"? a stream of what size? I will illustrate my question thus: In the Thames conservancy, the Thames basin is a basin without tributaries, except within three miles of the main stream. In the case of the Lee conservancy it includes all the tributaries of the watershed?—I was rather looking to the whole system, that is to say, the main stream with its feeders.

267. Do you think that such a board as the Thames Conservancy is satisfactory, or has been able to deal with that subject?—Its area of jurisdiction is too large. You want a system of bodies rather than a single body for such large areas.

268. Have you any idea as to what the area of the Thames conservancy is?—The exact figures are not so much within my knowledge as within the knowledge of Mr. Rawlinson, whom I should prefer being examined upon that subject.

269. Looking at such a river area as that of the Mole what would be your opinion?—That would be more within the scope of a single authority.

270. But very capricious areas would be found to exist?—Very varying areas exist.

271. If you adopted the river system you would have a new system of rates?—Yes, that is another difficulty; all those difficulties arise in consequence of the novelty of the authority, and that made me mention county boards as the authority.

272. Wherever there is a modern river conservancy has it not been very strongly against the putting of sewage into the stream?—That is the action of the Thames conservancy.

273. Therefore does it not become rather less necessary to consider the question of river authority in these questions of sewage and drainage?—There are two questions, namely, the question of the disposal of the sewage, and the question of the arterial drainage, which may very often have to be considered together. You may have to determine your plan of sewerage by natural considerations of flow, which, of course, to a great extent follow the river basins. In some cases you cannot get effectual sewerage without combining a good many places, and generally the places which you have to combine are those which are on the same line of water-flow.

274. The Sewage Utilization Act of 1865, the Sanitary Act of 1866, and the Acts in amendment of them, in point of fact, constitute a code of laws with regard to everything where the Local Government Act has not been applied?—Yes; or where private Acts have not provided for the same matter.

275. Have you had brought under your notice the probable operation of those Acts in their internal arrangements, such as their provisions for the election of committees?—Yes, and they are very insufficient in that respect. There is no provision for regularly recurring elections of the committee; the vestry choose the committee, and may upset it when they please.

276. There are no satisfactory provisions with regard to the imposition of rates?—The rates for defraying the expenses of the Acts in a great many cases are poor rates.

277. But in the case of special districts or rates there are no provisions with regard to their imposition, the Act merely says that there shall be a rate?—You are left very much to the general law as to rating.

278. I believe that under those Acts it is somewhat doubtful whether they apply to drains other than those created by themselves?—The Public Health Act carries over existing sewers to the Board of Health.

278*a*. But there is no such carrying over in the case of the sewage and drainage authorities?—That is so.

279. (*Sir T. Watson.*) If medical inspectors were appointed, do you think that they should act voluntarily, or only when sent by the central authority?—In speaking of a want of inspectors, I contemplated the want of inspectors who were in the regular discharge of the duty of inspectors. I meant inspectors constantly engaged in their work like Poor Law and Lunacy Commissioners; a permanent inspecting staff always engaged in the work of inspection.

280. (*Dr. Acland.*) I do not understand from what you have said with regard to river basins that you have had any particular reason to suppose that they would constitute good sanitary districts?—No, except that drainage with respect to superfluous moisture, and with reference to the disposal of sewage, depends upon the natural flow of waters, and that that more or less points to a connexion between the areas drained by a river and the districts which may be formed for sanitary purposes.

281. That is purely an engineering question, independently of the question of convenience?—Yes.

282. What kind of area do you think would be most convenient; would the registration districts be so?—The registration districts would give you one material advantage, namely, that you could get the statistics of death and disease, which now have no relation to areas of town government or local improvement.

283. Your experience has not shown you a reason why a river basin should be taken in preference to registration districts, or special sanitary districts?—Generally speaking, I would avoid dealing with England as a *tabula rasa*. I have never thought of forming new districts, because I thought that we should never get a chance of it. I have rather thought of getting some authority already existing. I have always supposed that we should have to take some such authority, and I have contented myself with the best which I could get for that purpose.

284. But that, I suppose, is an open question?—It is quite an open question. I do not feel myself competent to speak confidently upon it.

285. You have spoken of the necessity of an inspection, and I understand you to say that the powers of the Act are sufficient except as regards inspection?—Yes, speaking generally.

286. Have you had any experience (without mentioning names of places, which would be invidious,) which would lead you to suppose that works have been executed in country places or hamlets, where there would have been great benefit from the superintendence of a superior engineer?—Yes, we have had works which were good in plan, but bad in execution.

287. A first-class inspector there would have been of advantage?—Yes, if he could have seen the works in progress; but considering the amount of works going on in different places at the same time you could hardly have expected that inspector to have exercised such a surveillance as to see that the works were properly done; you must trust to the localities for that.

288. If large districts were existing, probably you could trust works of that kind to their superior engineers?—Yes, more or less.

289. In that case you would not burden the Secretary of State with such an inquiry?—No, you would get rid of a great deal which does not properly come within his functions.

290. I think that the Lunacy Commissioners have two kinds of inspectors, one legal and the other medical, with a regular circuit. Would there be any objection to a combination under the Local Government Act, of the functions of legal medical and engineering inspectors in the same persons?—No, except as regards the division of labour. The chances are that we should never get one sufficiently strong staff of inspectors, still less a double staff.

291. Do you know of many cases where there has been great harm from long neglect?—Yes, many cases of long-continued neglect and long-continued disease; and the inspector might have pointed these out before the people thought of remedying them. A great many of them do not know that we have this power.

292. (*Lieut.-Col. Ewart.*) You have said that in the case in which towns seek to borrow money an inspection is made?—Yes.

293. What is the definite object of that inspection?—In the first place, to go over the plans with the local engineer or surveyor on the spot, and in the next place, to hear the evidence on the spot as to the objections either to the plans or to the loan.

294. Does the adoption of that inspection carry with it the approval of the plans and estimate?—It may lead to the rejection of the plans, and to a correction of the estimate.

295. If permission is given to borow the money does it involve the approval of the plans and estimates?—The Secretary of State gives his sanction to the loan; he does not give any approval of the plans except an implied approval; he gives no formal approval of the plans.

296. He satisfies himself that the expenditure money which is about to be borrowed is necessary?—Yes. For instance, he would, perhaps, point out to the locality that a different mode of dealing with the sewage, or a different outfall or size of pipes, would be an economy. In most cases in which he suggests a change the local board adopt it, but sometimes they do not, and sometimes we have had continued differences, and a long argument with them upon the point, and if they decide in the result to abide by their own plans, where the matter is one in which difference of opinion might be fairly allowed, we have not thought it our duty to force our opinion upon them. If the plans were inconsistent with themselves, we should refuse to sanction the loan until such an alteration as we considered necessary was made in the plans.

297. In the case of drainage, would you say that they were going upon a wrong system, or would you leave them to themselves?—For instance, supposing such a question to arise as between the separate system and the joint system, that is to say, the system of of carrying the rainfall, and the sewage in separate pipes, and the system of carrying them together in the same pipes; in such a case as that, we should not think it necessary to enforce one system upon them in preference to the other.

298. When the power has been given to borrow money is any inspection made after the work is done, analogous to the Board of Trade inspection of railways, in order to see that the work has been properly

Tom Taylor, Esq.

6 Aug. 1869.

done?—No, because the work is covered up, and it would be very difficult indeed to supply any reliable information as to its execution.

299. Then you do not ascertain that the money borrowed has been properly expended?—We do not go into a detailed engineering examination upon that point.

300. Is there any audit of accounts in the cases of money which is borrowed?—There is an audit of accounts in all cases of local boards; they have a yearly audit.

301. That is an audit by themselves?—Yes.

302. But there is no audit by the authority which gives them the power to borrow?—No.

303. They are left to themselves after the power is given?—Yes, they have the poor law district auditor. It is for him, not for the Secretary of State, to see that they have spent the money for the purpose for which they have obtained authority to borrow it.

304. Or that they have spent it properly?—No; that implies that they have spent it to advantage. I think that that is one of the points in which we want power to inquire, and that that is what an inspector should do.

305. When an engineer is appointed to carry out the work through the failure of the local authority, what arrangement do you make with reference to levying rates in payment?—We should first endeavour to ascertain whether the local authority would raise the rate themselves, and we should tell them the expense to be provided for. If they declined to do it the Secretary of State would have power to issue a precept to them, or, in the last resort, to appoint a person to raise the rate if they did not do it.

306. That person, in fact, would become the treasurer?—He, in fact, would become the levier of rates in that district.

307. In the districts in which the local authorities refuse to act, and the Secretary of State intervenes, does not the central government become in the same position as the central government, say in France or in India?—I do not exactly understand your question.

308–9. I mean that as a general rule there are no voluntary local authorities in France or in India. Are you conversant with the way in which such works would be carried out in France or in India?—No, I have no experience of it at all.

310. You have not studied the French system of carrying out public works, say the health works in Algeria, for instance?—No; I have no experience of them.

311. Do you not think that if a conservancy board was made an intermediate authority between the ordinary local authority and the central authority, the work thrown upon them would be too much for them?—I have already said that I think that the difficulty with regard to conservancy boards is that the area would be too large for them to deal with. The reason why I fear the inefficiency of the Secretary of State for the business thrown upon him by the 49th section of the Act of 1866 is from the vast number of those cases which might arise. He has now as many appeals under that section to deal with as he can, and if he is to appoint engineers, and to raise money, and to rate, and to do all things consequent upon it, in many of these cases he will have a number of new duties thrown upon him which he could not fulfil.

312. Do you not think that there is at present a great conflict of authority between the powers which a conservancy board can exercise, and the powers which can be exercised by the central authority?—Yes, there is a necessity for co-operation between the two. A local board upon the Thames might come to us to authorize their sewerage, and we might sanction plans which the conservancy board would not sanction. We know that the conservancy board of the Thames have refused to sanction sending sewage into the Thames after a certain date, and we should not sanction it; but still there might be other cases where the conservancy board had laid down rules, of which we did not know, and we might come into collision with them.

313. (*Lord Robert Montagu.*) In the case of a large parish which contains a town which has come under the Local Government Act (I believe that Berkhampstead is a case in point) what would the rest of the parish be under?—Under its sewerage authority; under its vestry. The Sanitary Act was amended in that respect, parts of parishes in portions of which the Local Government Act was in force being made parishes for the purposes of the Act.

314. What would you do as to the rating?—The outlying portion of the parish would be a parish as regards rating for the purposes of the Act.

315. As regards a watershed board you have objected on account of the extent of area?—Yes, and also on account of the novelty of the whole thing, and having to provide a new machinery for it.

316. The objection of novelty if good at all would of course stand against everything on its first starting?—Yes, but you have already familiar areas of administration.

317. Is not the Thames area nearly 4,000 square miles, being the largest in England?—I do not know that it is the largest. But these points with regard to the geography of river basins, and so on, are not points upon which I feel myself able to give nearly such good evidence as my friend Mr. Rawlinson can give.

318. If it is carried out at all with regard to the Thames basin it would be an argument as to the possibility of carrying it out in smaller areas?—As far as I know, all that the Thames conservators have said is that from a certain time no sewage shall be discharged into the Thames; and something more is really wanted than that, because then all the towns in the area are in a hitch. These local authorities are not helped out of their difficulties.

319. Higher up the river a local authority would not make expensive works to purify the river for the purpose of the benefit of an authority lower down, and a local authority lower down would not carry out draining and dredging works for the benefit of an authority higher up?—The conservators are certainly very well adapted to attend to the interests of the river, but the difficulty is that the interests of the towns in the basin are not now attended to. The conservators only say, "You shall not discharge your "sewage into the river," but they exercise no authority over the disposal of the sewage excepting of that negative kind.

320. Putting that aside, would not the objection to such an authority, if you divided it into certain parts, be that the authority above would not care for the authority below, and *vice versâ*?—That shows that you want an authority over the whole course of the river for the purposes of the river.

321. And for the good of the towns on the river?—Yes, of course, so far as that is connected with the purity of the river.

322. In fact for the sake of the health of the whole basin?—Yes; but the conservancy board look to the river first, they are conservators of the Thames.

323. (*Chairman.*) When we talk of combining districts under a conservancy board it is for a special object, such as for preventing pollution in that watershed?—Yes.

324. For a particular object which affects more than one district, cannot those districts combine for that particular object, continuing their local functions for all other objects?—No doubt, and that is what they have a power to do at present, to unite for sewerage, for instance.

325. To such a plan of combination as that your objection of extent would not apply, because it would be simply for one particular object which affected the whole of that extended area, and the smaller functions would still remain distinct as before?—That would be so.

326. And as to rating, the rate for that particular object would extend over all that district, but the separate districts would still rate themselves for other objects?—Yes; but supposing that to be so, you would still have left all the other purposes for which I want an authority between the local and the central authority.

327. But the combination of districts for particular objects is a distinct question?—Yes.

328. Did I rightly understand you to say in your answer to Dr. Acland, that you thought that the enlarged inspectorship which you proposed might be of two different kinds, such as inspectors to inspect the sanitary condition of places, and inspectors to overlook scientific works, that is to say, medical and engineering inspectors?—Dr. Acland, as I understood, asked me whether I saw any objection to both medical and engineering inspectors being employed, supposing that you could not find men to combine both qualifications; and I said that I did not see any such difficulty, except the difficulty of getting a single staff of either one or the other, and the hopelessness, as I thought, of getting a double staff of one and the other.

329. You would not suppose that a person who was fit to inspect the general sanitary condition of towns all over the country required the same qualifications as a man who was to overlook some scientific engineering work?—No; but I never proposed inspectors special to superintend engineering works, but to inquire into the general administration of the Act in their district.

330. Do you contemplate a permanent staff of inspectors who should always inform you as to the sanitary condition of the country, and another set of engineering inspectors who should overlook engineering works?—No. The men who will examine works with a view to sanctions would be as they are now, and I should expect that they would generally be the same class of men as would be competent to inquire into the working of the Act. I did not propose the appointment of two distinct sets of men.

331. Do you propose a set of permanent inspectors who would make a circuit of the country, or do you want to use your inspectors for particular cases?—I should think that they would be the same class of men who would sometimes inspect a district and might also be reporting upon applications from districts.

332. Do you think that your inspecting body, as you propose it, would sometimes initiate the operations of your office, and in other cases would be employed to see that your orders were executed?—No doubt they would tend to diffuse knowledge of the nature and working of the Act, and so might tend to initiate proceedings; but I should not propose that they should go distinctly for that purpose.

333. Supposing the improvements which you have suggested to be carried out, namely, as to an increased inspection, and as to an intermediate body between the central authority and the local authority, do you think that the Local Government Act would generally work well as it is?—I think that the Local Government Act on the whole works very well. As far as regards the relations between the central and the local authority, I think that there is nothing particular to complain of. Of course it depends upon those who compose the local body. With a good chairman and a good clerk the Act works well, but with a bad chairman, or a bad clerk, and still more with a bad chairman and a bad clerk, it does not work well.

334. Throughout the country does it work well?—They press for amedments of the Act upon particular points. For example, they have now under the Local Government Act of 1861 power to carry their sewage outside their district for the purposes of outfall. Then they have power to acquire lands outside their district, the utilization of sewage, and they want the same power as regards water supply.

335. What they want, generally, is enlarged powers, but as to their constitution you do not see that they require much improvement?—No, I think that the general relations of the central and the local authority, under the Local Government Act, are very fair, and that there is no great difficulty there. The new powers which they want are such as they may expect to get by amendments of the Act. At this moment I have before the Home Office a set of amendments of the Act, by which the local authorities want it amended.

336. Can we have a copy of those amendments?—Yes. (*See Appendix*, p. viii.)

337. Have you some circulars with reference to the Local Government Act which you can put in?—Yes, there is a circular under the Local Government Act which gives "information respecting the provisions "of the Local Government Act, 1858, (21 & 22 Vict. "c. 98), and the Acts amending the same (24 & 25 "Vict. c. 61, and 26 Vict. c. 17)." There is also a circular giving "information as to the powers and "duties of sewer authorities under the Sewage Utili-"zation Acts, 1865 and 1867, and the Sanitary Acts, "1863 and 1868, (28 & 29 Vict c. 75, 30 & 31 Vict. "c. 113, 29 & 30 Vict. c. 90, and 31 & 32 Vict. "c. 115)." There is likewise a circular as to the Nuisances Removal Act. (*The witness delivered in the circulars.*)

338. Can you tell us the amount of money borrowed under the Act?—Yes. The amount of money borrowed under the Act from 1848 to 1858 was 2,956,178*l.*

339. Was that in England and Wales?—Yes.

340. Irrespective of the metropolis?—Yes. That is under the Public Health Act of 1848. Then, under the Local Government Act, since 1858, in the last 10 years there has been borrowed, with the sanction of the Secretary of State, 4,611,105*l.*, making a total of 7,567,283*l.* borrowed. Under the Sanitary and Sewage Utilization Acts there has been borrowed, with the sanction of the Secretary of State, 61,478*l.*, making a gross total of 7,628,761*l.* borrowed under the two sets of Acts.

341. From your practical knowledge of the working of these Acts, do you think that they are now in a state fit for consolidation?—Certainly.

342. And do you think that that is desirable?—Certainly; in itself, most desirable.

343. Have you any other remark which you wish to make?—I have here the reports which we have made yearly to Parliament since the Act of 1858 was passed, which show everything which has been done from year to year.

344. (*Mr. Hibbert.*) Is any report made to Parliament with regard to what is done under the Sewage Utilization Acts?—We are not bound to do that; but in our last three reports, wherever we have granted sanctions under the Sewage Utilization Acts, or have made reports under those Acts, we have included these in our report.

345. Is any return made to Parliament as to the amount of rates expended for those purposes upon the sewers?—No. So far as I know we have no means of providing such a return. The Poor Law Board would be the only board who could make such a return as that, if they have the means of doing it; but I do not know whether they could do it. I will put in a return of the proceedings under the Sanitary and Sewage Utilization Acts. This return extends to last year, from the passing of the Acts (*delivering in the same*).

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Thursday, 29th April 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.
The EARL of DUCIE.
The Right Hon. LORD ROBERT MONTAGU, M.P.
The Right Hon. STEPHEN CAVE, M.P.
Sir THOMAS WATSON, Bart., M.D., F.R.S.
Lieut.-Colonel EWART, R.E.
JOHN ROBINSON MCCLEAN, Esq., M.P.
JOHN TOMLINSON HIBBERT, Esq., M.P.
EVAN MATTHEW RICHARDS, Esq., M.P.
GEORGE CLIVE, Esq.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
JAMES PAGET, Esq., F.R.S.
HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
JOHN LAMBERT, Esq.
FRANCIS THOMAS BIRCHAM, Esq.

Henry Thring, Esq.

29 April 1869.

(2.) HENRY THRING, Esq., examined.

346. (*Chairman.*) You are the parliamentary counsel?—Yes.

347. You have drawn up for the Home Office a memorandum on the subject of the inquiry before us?—Yes, I have prepared a memorandum at the request of the Home Office for the use of the Commission; it has not been submitted to the Government, and I alone am responsible for its contents.

348. You divide the subject generally into the operation and the administration of the sanitary laws?—Yes, into the law and the administrative bodies.

349. You state that the common law offers no practical remedy, but that the statute law is ample but complex?—That is a difficult question to answer in that form. Practically the common law is only enforceable by indictment, and in exceptional cases.

350. But that is by a process too costly and lengthened to be of practical use?—Practically it is only of use where very large interests are at stake, and where very rich people can be brought forward in support of those interests. Speaking generally, I consider that the statute law relating to sanitary matters is sufficient in substance, but is in form very complex and exceedingly difficult to understand.

351. You seem to think that what is referred to us is to amend and simplify and consolidate the laws and the constitution of the authorities on the subject?—It appears to me that the Commission will be of the greatest possible utility if they can point out the best mode of consolidating the law, and still more if they can discover the best mode in which the bodies interested in the administration of that law are to be constituted.

352. Are you aware that since you drew up that memorandum the metropolis and Ireland and Scotland, have been excluded from the scope of our inquiry?—Yes, and I think rightly excluded; it would have been impossible to have included so vast a mass of matter. The metropolis from its size is entirely different from any other town, and the Irish and Scotch towns are subject to different laws from those in force in England.

353. I believe that you group the sanitary laws generally into two codes, namely, a town code and a village code?—Yes. I have done that in my memorandum for the purpose of explaining how the present law stands; but I do not necessarily consider that to be the best mode of grouping those laws when they are consolidated. In fact, I can hardly give an opinion upon the proper form of consolidation without really undertaking the work myself.

354. Is it your general opinion that the distinction of a town code from a village code need not be permanently kept in view in the consolidation of these Acts?—Not in the consolidation; the real difficulty in the sanitary law is one of principle, namely, how to distinguish the laws you ought to apply to very large places from the laws you ought to apply to country places.

355. Is it the fact that the sanitary laws as they now exist are such that the local Government Acts almost entirely apply to towns, the Nuisances Removal Acts apply partly to towns and partly to villages, and the other Acts apply to villages?—Yes.

356. Is it your opinion that the law as it stands is sufficient, as far as powers go, for towns?—"Towns" is a very ambiguous word. I think that with respect to the great cities, which have private Acts, in addition to the general Acts, for instance in London and in Manchester and other large towns, the law is in substance amply sufficient, so far as the powers go.

357. In Manchester and in other large towns are there not generally special Acts?—Yes, almost invariably.

358. In any consolidation, do you think that special Acts can be made to group with the general law upon the subject?—It is impossible for me to speak upon that point. I think that you must have special legislation for very large towns, such as towns with a population of 200,000. I think that you could not possibly make a general law which should at once be applicable to a country village, and yet supply the wants of a very large town.

359. What was the limit which you had in view when you talked of the separation of a town code and a village code?—That is a practical difficulty to be solved by the Commission. I think that a town of 100,000 persons is a town which, as a general rule, would require special legislation, but I am speaking without any special knowledge.

360. The basis of that definition would be rather the amount of population than any particular form of government?—Yes. You cannot distinguish towns by their forms of government, because in England you not unfrequently have the same form for a very large town, and for a town of a comparatively small size.

361. I observe that you exclude from our inquiry, according to your view of it, the Burial Acts, the Common Lodging Houses Acts, and others. Do you consider that in the consolidation of the sanitary laws we may take the laws which you have scheduled, exclusively of those which you have excluded?—You must place a limit somewhere. The limit which has been taken in the existing Sanitary Acts can scarcely be called a limit. The Local Government Acts, for instance, give in addition to sanitary powers every possible municipal power, making parks and roads, police clauses, and so on. If you add to those provisions the Lodging House Acts, and still more the Factory Acts, you will include the whole local legislation of England. I should myself be very much inclined to draw in any new legislation a marked line between strictly sanitary provisions and general local laws. I call strictly sanitary provisions the powers required for drainage, or for removing human excreta; also the powers required for the removal of nuisances. I should not consider that Acts such as you have mentioned ought to be consolidated in a general law unless you made a complete code embracing every possible local want.

362. Supposing that we were consolidating the Local Government Acts, the Nuisances Removal Acts, and the Sewage and Sanitary Acts, can you tell us what you think would be the general headings of such a consolidated Act?—The proper answer to such a question involves the whole difficulty of consolidation. Speaking roughly, I should repeat what I have said before. As a general rule, in every Act I lay down the law first, and I end by stating the bodies who are to administer the law, using in my statement of the law some general terms, such as "local authority" or "sanitary authority," whenever there may be

occasion to refer to the bodies intended to administer the law. In this instance I should begin by laying down provisions for removing human excreta. I should then go to the supply of water and the removal of nuisances. I consider those to be the most general subjects for legislation. In dealing with the remainder of the law I should arrange it in the best manner I could, placing probably in a separate Act the powers of local government as contradistinguished from the sanitary powers properly so called. When I had got through the law I should proceed to deal with the local authorities. Selecting first the existing town authorities, such as town councils and improvement commissioners, I should vest in them within their jurisdictions the powers to execute the law. In towns where no such authorities existed, it would be necessary to create elective bodies, as for example, local boards, under the Local Government Acts. In villages vestries would be the local authority.

363. What are the chief alterations which you would propose in order to prepare the sanitary laws for consolidation?—Beginning with the law of sewerage, I think that an optional power should be vested in local authorities in certain cases of adopting earth closets instead of water-closets, and that in these cases the persons who required water-closets should have thrown upon themselves the expense of carrying off the refuse matter from those closets. A difficulty occurs in small country towns where one or two persons are desirous of having a complicated system of sewerage for the purpose of removing the refuse of their waterclosets, while earth closets, and a simple mode of removing the sewage water, might possibly be of advantage to the poorer classes, and might not entail so much expense upon the town. With respect to the law of nuisance, there is a difficulty in obtaining the necessary evidence on the ground that the law requires you to prove that the nuisance arises from a particular manufactory. For instance, if I complain of the smell of tallow, I must prove that that smell proceeds from a particular tallow manufactory. If there are 10 manufactories all close together, and if the nuisance is intolerable, I fail, because I cannot prove that the particular nuisance which annoys me proceeds from factory A, and not from factory B. I think that that should be amended. With respect to noxious trades and manufactories, the great interests involved will make legislation extremely difficult; but I think that a law might be passed declaring that manufactories should be obliged to use the best practicable means, at a moderate cost, for removing any nuisance which might arise from the processes carried on. I also think that solid matter might at all events be excluded by law from being thrown into running streams. It would be most desirable, if possible, to prevent the pollution of streams by liquid matter, but the question involves interests of such extreme value, that I am unable to suggest any probable mode of carrying the law into effect. With respect to over-crowding I think that the law, if anything, is too stringent. It is impossible to carry into effect a provision that a house so overcrowded as to be prejudicial to the health of the inmates is to be closed unless dwellings are made cheaper, and the means of procuring better dwellings are brought within the ability of the poorer classes.

364. With regard to your suggestions as to water-closets versus earth closets, and I would also say with regard to different systems of sewerage, do you not think that the law should not enter into the comparative merits of systems, but should give a general power covering all systems?—Certainly it is not for the law to instruct people how to do the thing, but to give power to them to do it in the mode in which they may be advised by competent authority to do it.

365. Have you any distinct opinion as to what provisions in these laws should be permissive and what provisions should be obligatory?—As far as I can judge I think that there should be an obligation upon some body or other (and who or what that body should be, whether the community or individuals, is a very difficult question) to take care that all human excreta should be removed from the vicinity of dwellings, and that every person should have access to a proper supply of water; it seems to me to be of one of the great difficulties which this Commission will have to settle, not to relieve the owner at the expense of the community, but yet to determine when the community must step in in order to enable a number of people to carry out a joint scheme. In the case of a town, it is clear that the main sewers must be made by the community, and that the house drains, as contradistinguished from the main sewers, must be made by the owners. In country places there may be considerable difficulty in distinguishing where the duty of the community begins and that of the owner ends. For example, an owner builds a cottage by itself without a proper water supply, and without a drain. I should think that in such a case he ought to be responsible for making the drains, and supplying the water. On the other hand, where there is a considerable aggregate of dwellings joint action is necessary, and in most cases it would appear to me to be the duty of the community to make main sewers for carrying off general refuse, and to provide a general supply for water.

366. With regard to the constitution of the local authorities, may I thus describe the complication which at present exists, namely, that the local authority means in boroughs the council, in other towns commissioners, and in places under the Local Government Act an elective board, and that the nuisance authority is the same body with different functions, and that the sewerage authority is the same body, with the additional confusion that in rural districts it, as also the nuisance authority, carries parts of the powers of the Local Government Act in guardians, overseers, and vestry?—Yes, I think that that is a correct general description, there is a great confusion of names.

367. Would the complication be cured if all those authorities were called by the same name, namely, the local authority according to the place, and if that local authority in each place had given to it all the powers and functions which the place required?—Yes; assuming that you could correctly lay down the law, you would use a generic name for the various local authorities, and then select such local bodies as you thought fit, grouping them under the generic name. That would be the proper mode, in my judgment, of avoiding the difficulty.

368. Following out the general sketch which you have given to us of a consolidating Act, supposing that the commencement of the Act enumerated all possible powers and functions which could be legally exercised in local government throughout the country, and that the Act proceeded to say that every place in the country, whether town or rural, should have some local authority, and that that local authority should be such and such, according to the place, and that that local authority should have all the powers before enumerated, so far as they were required in the place, would not all the complication which is now complained of cease?—Certainly, and that would be the proper way of doing it, whatever system you adopted.

369. In fact, excluding the metropolis, there would in that case only be three kinds of local authorities, namely, in boroughs the council, in other towns having improvement Acts commissioners, and in rural districts board of guardians?—Sometimes in municipal boroughs there is not only a town council, but a body of commissioners acting under a local Act also, and the commissioners have sanitary duties to perform, while the town council have the general management. It would in that case be necessary to decide in which body you vest the powers. I think that you ought to vest them in the council as having the general government; but at the same time you must if possible provide for a transfer to the council of all the powers of the commissioners, if they exist. The matter is complicated in every way, owing to the complication

Henry Thring, Esq.

29 April 1869.

of our local law, but as a general rule the town council should be the body.

370. If it was known that in every place there should be a local authority, and if that one local authority had all powers of local government given to it, there would be no complication, would there?—No, not if you abolished the local Acts where they interfere.

371. Do you think that by degrees inducements could be offered to merge the local Acts?—I think so.

372. So that you think that gradually we might get that complication to cease?—I should think so, but I have no experience upon that point.

373. Have you any proposition to make as to places which have a variety of old corporations, such as Seaford?—There are very few such places. You might in that case vest the power in the town council. I think that the boroughs not under the Municipal Corporation Act are very few, and need give rise to little trouble.

374. How far do your last answers apply to country districts?—In country districts there are now two authorities, namely, the vestry and the guardians. As far as I can judge, where there are structural works to be executed it will be absolutely necessary to keep to the vestry, and therefore I think that you must deal in country places with the vestry as the sanitary unit, and not with the guardians.

375. Then in no case would you have the board of guardians as the local authority?—No. My own opinion is, that in the country there ought to be a general control in sanitary matters lodged in a county board, which would entirely do away with an intermediate authority like the board of guardians.

376. Supposing local authorities to be constituted all over the kingdom, might not several local authorities combine for any special object affecting several districts?—I think that they might do so with the greatest advantage. I think that you might make a federal body, as it were, for the purpose of draining a large district or procuring a supply of water.

377. The rate for the expense in such a case would be a special rate levied upon the area affected?—Yes, a contributory rate. Assuming that you took any area whatever, and combined all the local authorities in that area, you would then make a joint governing body, who would execute the joint works and levy from the subordinate local authorities a contributory rate, and that rate must be defined either according to the rateable value of the property, or according to the interest of each party in the improvement. There would be very little difficulty in adjusting it fairly enough.

378. Will you describe a little more minutely the idea which you have thrown out of a county board, to act, as I understand, mediately between the local authority and the ultimate appeal to the Secretary of State?—I do not mean the county board to act mediately in cases where it acts, but to have absolute authority. At present the Secretary of State may compel any local authority to drain its district. I think that power must be retained in the case of very large towns, as they would not submit to be thrown into the county. On the other hand, I think the power of compelling a county to drain itself ought to be vested in a county board, by which I mean a mixed body consisting partly of elective members and partly of official members—the justices. The mode of constituting the body is a question of considerable difficulty; but assuming that body to be formed, I think that they ought to have all the powers which were vested in the Secretary of State of compelling country parishes, and places within their jurisdiction, to drain themselves. If they did not drain themselves, I think that the power of doing it ought to be exercised by the county surveyor. I also think that it would be a very great advantage if the county organization could be carried further, and if you could throw into the county for a great many purposes the small boroughs which have a separate court of quarter sessions, and do not contribute to the county rate, and therefore are not really brought into the county system. Unfortunately in England the same municipal government is very often applied to a very small place and to a very large place. For instance, there are very large towns which are municipal boroughs, with a separate court of quarter sessions; there are also comparatively small towns which are municipal boroughs, with a separate court of quarter sessions. It is very desirable that a large town with 200,000 or 300,000 inhabitants should be treated as a county; but it is also very desirable that a small borough should be thrown into the county for sanitary and many other purposes.

379. Is the body which you have in your eye something like the proposed elective financial county board?—Yes. There have been two schemes, one for electing them according to unions, and the other for electing them from highway board authorities. I think that if an elective county board were established it would be very desirable to give large powers to that board.

380. Could such a board be sufficiently permanent to be always prepared to deal with applications?—It would not, like the court of quarter sessions at present, end with each sessions—you would make the county board a corporate body. You must of course make provision for having a permanent officer to do the work, and the board itself would be as permanent as the town council, or any other corporate body—it would be a county council.

381. There would be an officer who could always be applied to?—Yes.

382. And he would have a staff of inspectors?—Yes. Instead of making it a municipal council it would be a county board, consisting partly of *ex-officio* members and partly of elected members.

383. What would be the relation between such a county board and the local government office?—My own opinion is that the local government office, or the central office in London, ought to be a consulting body rather than a body to compel the local authorities to do their work. I believe that in many cases the local bodies would gladly receive advice from the central authority on a variety of subjects on which they wished to receive information. I also think that the central body would be most useful in collecting reports from all these local bodies, which reports would be laid before Parliament.

384. Would you contemplate a different set of inspectors as being employed by the county boards from those employed by the local government office?—Yes; I should consider that a man who sustained the character of county surveyor, with whatever staff he might require, would, for instance, drain a town which refused to drain itself, in the same way as he would superintend a county bridge, and that he would not have anything to do with the central board.

385. I understand you to propose that the county surveyor should have a certain number of inspectors?—I do not know what staff he would require.

386. You do not suppose that the county surveyor would himself be able to discharge all the duties of an inspector?—I should have thought that it would have worked in this way, that supposing that I lived in a small country village, say in Somersetshire, and that the majority of the village would not drain, and that I thought that the village should be drained, I should write to the county board to that effect, and that the county board would ascertain whether my complaint was right, and that if it was right they would do the work.

387. That county board would only be a mediator between the country local authorities and the Home Office. According to your plan do you not leave the towns in direct communication with the Home Office?—I do not pretend to have at all worked out the scheme with respect to the larger towns; I apprehend that you could not satisfy them except by placing them under the Home Office, as they now are. I would place the smaller towns under the county board,

and would allow them representatives upon the county board.

388. (*Earl of Ducie.*) You have drawn a distinction between country and town districts, and you have told us that in country districts where buildings are aggregated together it becomes a common duty to provide for their main drainage. You have also suggested that in districts where there are separate buildings, it would become the duty of the owner to remove the excreta. You are probably aware that in such districts as those you meet with the greatest amount of ignorance and poverty. How could you initiate proceedings against them? Have you any suggestions to offer upon that point—how are you to deal with the lowest class of segregated buildings?—When a man builds a separate house for a labourer I think that he ought to provide it with a privy, and to take care that there is a proper place to drink from. I do not think that a man ought to build a house and to leave it without a proper privy and a proper supply of water.

389. Take the case of a cottage proprietor who builds a house for himself?—If a man built a house for himself, I would not allow him to live in it except it was built in such a manner that a human being could live in it without manifest injury to his health.

390. What authority would you suggest in such cases?—I would simply make it penal to build a house without a privy and without a proper supply of water.

391. There is no power in that respect at present in country districts, is there?—I do not think that there is.

392. Is it not the case at present that there is not sufficient power?—There is a power given in the Sanitary Act of 1868, by section 4, which incorporates the 51st section of the Public Health Act of 1848. There is also the 13th section of the Nuisance Removal Act of 1855. It appears, then, that there is sufficient power to compel owners to provide their houses with privies, but not sufficient power to compel them to provide water.

393. (*Mr. Hibbert.*) I understand you to say that there are places where commissioners exist and where there is also a town council; is it really the fact that the two bodies co-exist at the same place?—I happen to know the fact in one place; I had put in a bill that the town council in all cases should have certain sanitary powers, and a remonstrance was sent to the Home Office, stating that in a particular case the bill was wrong, and that the powers ought to have been vested in the improvement commissioners. I believe that the case is not very common.

394. With respect to the country districts, do you not think that if your view was carried out, of putting the power in the county financial boards, a great difficulty would occur in large counties like Lancashire and Yorkshire as respects working over so large an area?—Do you mean that the county boards would not have power enough?

395. That they would be too unwieldy, and would have so large an extent of country to look after that it would be almost impossible for them to look after it properly?—You might divide their duties between different committees.

396. Would it not be possible first to have an elective board in every parish, instead of having separate officers to look after the roads, and that the elective board in every parish should look after the roads and the sewerage, and everything in fact connected with the health of the parish, and that one or more persons from that board would represent the township or parish upon the board of guardians. Would it not in that way be possible so to carry on the representation as to do the work by three steps, instead of working in your way by two steps?—I do not think that it would be advantageous to interpose the board of guardians between the parochial authority, whatever it might be, and the county board. I think that it would be advantageous to give the county board the superintendence of roads in the last resort; but the member of the Commission who has asked the question is aware that at the present moment the roads in most places are not within the control of the parish, but are within control of the highway board.

397. That objection would only apply to those districts where highway boards had been formed?—I think that it would be a very good thing to put the roads under a larger superintendence than that of a parish.

398. Would there not be an advantage in having an intermediate body between the parishes and the county financial boards, particularly in large parishes?—I think not.

399. Are you aware that, supposing that county financial boards were carried out according to what is proposed, there would in Lancashire be from 80 to 100 members upon such a board?—Then I would divide Lancashire into divisions for the purposes of a county board.

400. Have you any particular objection to giving any of these powers to boards of guardians?—Yes; I do not think that the board of guardians are a good body; they are fully employed in superintending the poor law, and I think that they had better be confined to that.

401. But you are aware that they act for the removal of nuisances in given districts?—Yes, but I think that that ought not to be continued; I think that it is better to place that duty in the vestries, subject to the control of a county board.

402. Are you aware that during the cotton famine the guardians of the different unions were made the persons to carry out the works in country districts?—I have no doubt that such was the case, but I know nothing about it.

403. (*Mr. Clive.*) You have stated that you do not wish for any intermediate communication between the parish and the central board?—I do not think it desirable that any intermediate body should be interposed between the subordinate local authority and the county board. I would give power to any local authority to communicate with and ask advice of the central sanitary authority in London.

404. Have you considered the minuteness of some of the parishes and the inequality of area?—Yes; I think that in some cases it would be a capital thing to unite the parishes. I would take the parochial division as the unit for the purposes of rating; but supposing that small parishes wished to unite together for the purpose of drainage, or for the purpose of water supply, or for any other sanitary purpose, I should enable them to do so.

405. Would not the omitting of the board of guardians be a good deal facilitated by the fact of the county financial board being elected by the guardians themselves?—Yes; I understand that in any scheme the guardians would have a considerable voice in the election of members of the county financial board.

406. So that any reference to the board of guardians, as a board, would be unnecessary?—Quite so.

407. In your proposal of a county financial board do you mean in any way to include the quarter sessions?—I should make the county financial board simply an administrative board, and I should consider that drainage was in the nature of administration, and not in the nature of judicial business; but wherever law intervened, for example, assuming an owner to be liable to a penalty for not draining his house properly, or for not building his house properly, I do not intend that the financial board should judge of that case, it must go to the quarter sessions as a legal tribunal. I should consider that the administrative functions ought to be altogether separated from the judicial functions, and that the administrative functions should reside in the board.

408. You said that you would make it penal for any person to erect a house without sufficient drainage and water supply?—Yes. I find that it is now penal as to drainage.

409. How is that penalty to be enforced?—I am aware that there is a difficulty in enforcing penalties.

Henry Thring, Esq.

29 April 1869.

410. Do you not think that it would be possible, by compelling a system of tanks in every house, to make a provision for water available for every house?—I cannot practically answer how it ought to be done, but I think that, as a principle, a man, wherever he lives, ought to have access to a privy and access to water.

411. It is possible to obtain a supply of water without in every instance having an underground supply?—I presume that in many cases it is absolutely necessary to have a surface supply, but I cannot speak accurately. I conceive that in many cases you can only get surface water. In a particular parish with which I am acquainted all the underground water is tainted with some solution of a mineral, and is undrinkable, and therefore in those cases I presume that you ought to have proper tanks to collect the drainage water and the surface water.

412. And that would dispense with the necessity of water supply from below?—Certainly; I did not intend to give an opinion as to what water ought to be supplied, but only that there ought to be a supply.

413. (*Dr. Acland.*) You seem to infer that this Commission ought hardly to lay down rules except as to drainage and water supply?—What I meant to say was that I should not upon my own judgment advise the Commission to go into a consideration of the various systems of water supply.

414. I quite understand that: but I understood at the outset of your evidence that you said that there was a difficulty in laying down the law upon other points. In the latter part of your evidence you have spoken much of the construction of the boards which should be administrative boards for particular purposes. The real object of my question is to learn whether there is any objection to our pointing out what should be the duties of boards of that kind, and especially of inspectors, or persons appointed to see to the execution of those duties. Are we not competent to lay down, and is it not absolutely necessary that we should lay down, what those persons are to do?—As far as my judgment goes, I should consider it of great value if the Commission would lay down general rules as to the duties to be performed by local bodies and their officers; but it would not be advisable that they should go too much into detail.

415. You did not mean to express to us that there was any difficulty in laying down the principles of the duties which are to be discharged. Would it not be desirable that we should consider also the qualifications of such officers?—Certainly.

416. As, for instance, if they are charged with sanitary duties, as gentlemen under the Poor Law Board are constantly charged, should we not endeavour to point out what kind of knowledge such sanitary inspectors should have—whether it should be engineering knowledge or sanitary knowledge? There is, I presume, no legal difficulty in our defining those qualifications?—There is no legal difficulty whatever in defining any qualification.

417. (*Mr. Lambert.*) I understood you to say that you considered that the law is generally sufficient at the present time for the purpose of enforcing the necessary works of general sewerage and drainage?—I consider that the powers are sufficient, but I consider that the power of enforcing them, which is vested in the Secretary of State, is in many cases not likely to be advantageous.

418. Do you consider that the power is sufficient as laid down by the law, supposing that the local authority discharges its duty?—Yes; I think that if the local authority is ready and willing to do its duty, it requires very little more power than at present.

419. When you speak of the general law, I suppose that you refer to the general statutes, and that you do not refer to local Acts?—No, I do not refer to local Acts, as a general rule, but in many towns the general Act is excluded, and they are worked under a local Act. Speaking generally, I think that if a town is willing to do its duty as regards the sewerage and drainage, there is quite power enough.

420. Are there not a large number of towns which are not under the general law in that respect, but under bodies of commissioners?—No doubt there is the greatest possible difference in the governments of towns.

421. I believe that those commissioners have the power of incorporating any portion of the public Acts in their local Act, if they think proper to do so?—I think that they have the power of adopting the Local Government Act. Under the 15th section of the Local Government Act no doubt such commissioners might adopt any part of the public general Act.

422. Will you refer to the section and state what process is necessary for that adoption?—They can adopt any part of the Act by passing a resolution, which resolution is to be forwarded to the Home Office.

423. They can incorporate within their own Act any portion of the public Acts?—Yes.

424. The consent of the Secretary of State is not necessary for any such incorporation, but the local authority can legislate so far for themselves?—So I understand the clause.

425. Can you state whether this section has been acted upon to any extent by local authorities?—No, that is not at all within my cognizance.

426. It is not necessary I presume that there should any record of the adoption of the general Act, beyond the minutes of the body itself?—I presume that the Home Office keeps a record of the resolutions which are forwarded to it, but it is not essential under the statute. There cannot be an easier process. I take it that improvement commissioners, if they choose, can adopt any portion of the Local Government Act.

427. But you are not aware to what extent this provision has been acted upon?—I am not.

428. With regard to the administrative body, I understand you to say that you consider that there should be three such bodies, namely, the town council in boroughs where there were town councils, in other towns commissioners, and in villages or rural districts some other body for the administration of these laws?—Yes; I think that the natural body in a borough is the town council, that is the governing body. Where towns are under improvement Acts, the natural body is the improvement commissioners. Then in parishes there is no local body left except the vestry.

429. You consider that where there is a town council they should be the local body?—I think so.

430. If the town council acted as a local body they would simply act for the municipal area?—Yes, they could not go beyond the municipal area.

431. Is it not the fact that many towns have largely increased beyond the municipal areas?—Yes, and I believe that there are cases in which the improvement commissioners have a wider area under their government than the town council.

432. Supposing that the town council is to be the governing body in a municipal borough, it would be necessary to extend that municipal borough, so as to include the adjacent portion?—No doubt. I have no doubt that there are within your knowledge places in which it would be impossible to vest the powers in the town council, and in which they must be vested in the commissioners, because they happen to have a wider area.

433. I apprehend that it would be necessary to put the whole of the district under the town council, and therefore to enlarge the area?—Yes, I think that the area ought to be extended.

434. At the present time under the Local Government Act, where the district embraces not only a town but an adjacent district, the local board consists, I believe, of persons representing the town council and persons representing the adjacent district?—I think so.

435. It is altogether a separate body from the town council?—Yes. Then again in places where at the present moment the sanitary area, so to speak, extends beyond the bounds of the municipal borough, it would be another exception. Either the municipal borough must be extended to the limits of the sanitary area, or

some other body must be substituted for the town council.

436. Are you aware whether in forming districts under a local board, the fact that there is a town council has been an element in limiting the area to the municipal borough?—I am not aware of that as a fact, but there is very little doubt that it has been so.

437. Thus excluding the adjacent district from the area?—I should think that that must have been the case. I may add, as a correction of my statements respecting local authorities, that no system of sanitary legislation can be efficiently carried into effect without a readjustment of the boundaries of towns, so as to include populous districts which have grown up without the actual limits, and although constituting part of the town neither share in its burdens nor submit to its control.

438. With regard to the powers of the boards of guardians, have they not the power of appointing inspectors of nuisances?—Yes.

439. And the board of guardians where it is the local authority has the same power as any other local board would have of putting in force the provisions of the Nuisances Removal Acts?—I think so, certainly.

440. With regard to dwellings in a crowded and unwholesome state, the board of guardians would have the same powers as the town council in a town has of getting rid of those nuisances?—I think there is a concurrent authority. Under the Nuisances Removal Acts the guardians have the power of removing them, and under the later Sanitary Act the vestry have also the power to do so.

441. Where the board of guardians are the authority they would have that power?—Certainly.

442. So that if a person complained of a nuisance to the board of guardians, would it not be their duty to appoint a person to inspect it and to abate the nuisance?—No doubt.

443. (*Mr. Shaw.*) There is not power at present to compel a water supply for two or three detached cottages in rural districts?—I think that there is a power of compelling a supply, but that law I believe at the present moment only enables the vestry to give a supply if they like. I do not think that there is any power of compelling the owner to supply a cottage with water.

444. Is there any power to compel a water supply to two or three detached cottages?—It is difficult to answer the question in the precise terms in which it is asked. There is a power to compel a sewer authority or vestry to provide a district with water in cases where danger arises to health from the insufficiency or unwholesomeness of the existing supply; and where a proper supply can be got at a reasonable cost. The Acts are the 29th & 30th Victoria, chapter 90, section 49; the 30th & 31st Victoria, chapter 113, section 2; and the 31st & 32nd Victoria, chapter 115, section 8. But I do not think that under those provisions you could compel a sewer authority to supply one or two cottages alone with water, provided that the remainder of the district was properly supplied.

445. Then your suggestion would be that there should be a power to compel the owner to give a water supply?—I think that at all events in cases of new cottages the owner ought to be compelled to provide a supply, or to see that there is a supply before the cottage is passed as being fit for a human being.

446. Would you propose to give a like power to that which is given by the Metropolitan Act in respect to drains, namely, that when any person builds a new house he must give notice to the vestry, who send their surveyor, and if the surveyor sees that the person building the house has not complied with the requirements his building is liable to be pulled down?—I do not think that such a stringent provision is necessary. I think that if you were to put on a fine, or to make it possible for the local authority to come in and do it, in case of the party omitting to do it, that would be sufficient. Speaking generally, I think that it is enough to make an enactment to the effect which I have mentioned, and to allow it to be carried into effect by doing the work and charging the owner.

447. Is there any power to close a poisonous water supply? Have the local authority any power to stop up a well or pump which acts injuriously to health?—I do not think that there is such a power; it would be advisable to have such a power, but I presume that there would be great difficulty in ascertaining what water was poisonous.

448. Would your proposed power to the local authority as to cottages include anything as to ventilation?—I do not think that I have sufficiently considered the question to give an answer.

449. The power at present is very vague, would you give power to the local authority to lay down bye-laws?—I do not think that I would do so in the country.

450. As regards the vestry being the local authority, I think that in one of the Acts the power was given to the vestry, and then that power was afterwards transferred to the guardians by the Act of 1860. The Act of 1855 gave the power to the vestry; and I think that there is power in that Act to delegate those powers to a committee of the vestry?—I cannot answer your question. I dare say that the powers were transferred, but with respect to the vestry there would not be the remotest difficulty in making them a permanent body, and in making them subject to the county board.

451. (*Mr. Richards.*) You have stated that you consider that local authorities desiring to perform their duty have at present sufficient power to construct necessary sewers?—Yes.

452. How would a case of this sort be provided for under the law? Assume a street of houses, and that there is a public sewer running through the middle of the street, and that eight houses are to be drained. No. 4 belongs to a different owner from No. 3, and the engineer lays down his plan of a public sewer through the street, and a subordinate sewer at the back of the houses. Under what Act of Parliament can the owner of No. 4 insist upon passing through the ground of the owner of No. 3?—No power is given to one owner to go through another man's land in towns to reach a sewer, and it might be advisable in future legislation to meet the case suggested by you by empowering the local authority to make the necessary communications between the houses and the sewers.

453. (*Mr. Clive.*) Is there not an analogous power to it in the Drainage Act?—I believe that there is.

454. (*Earl of Romney.*) In the Agricultural Drainage Act is there not such a power?—I believe that there is. I am not aware of there being any power in towns by which the owner of one house can carry his drains through the private drains of another house.

455. (*Mr. Richards.*) Although the engineer may think it a desirable mode of drainage that a subordinate sewer should go at the back of the houses?—I conceive that there is ample power in the local authority to acquire land to carry its own sewers, and it must take care to do so in such a way that each house can carry the sewer through its own territory; at least such I believe to be the law.

456. With respect to earth closets, do you say that every street in a small town should choose whether it should be drained by earth closets or by water-closets, or not?—No. According to the law, if three houses had water-closets and the rest of the town wished to try the earth-closet system, the owners of the houses with water-closets might say, "Under the Public "Health Acts we can compel you to make drains "which will carry our water-closet refuse away at "the public expense." In those cases it seems to me that there is a certain hardship that three or four owners should compel the town, against their will, to carry off at the public expense the private refuse of their houses; and therefore I think that a discretion should be lodged in the local authority to determine whether it will have water-closets or whether it will have earth-closets, either wholly or partially, and that

Henry Thring, Esq.

29 April 1869.

if in that case the owners of water-closets insist upon keeping them, they should be at the additional expense thereby caused.

457. You would vest in the local authority the power of deciding whether there should be earth-closets or water-closets?—At the public expense.

458. Am I to understand you to say that if three owners in a street preferred earth-closets to water-closets, they should be exempt from the general charge of sewerage rates?—Not at all. Where the whole of a town through its representatives determine upon earth-closets, I think that that town ought not to be compelled to make sewers for water-closets at the public expense simply because there are in that town people who have water-closets in certain streets. I think that the minority should not be enabled to compel the majority to adopt water-closets against their own wishes.

459. Is there any provision in any Act of Parliament under which the Secretary of State can raise funds to do the work, where the local authorities have omitted to do the necessary sanitary work?—Yes, he has that power under the eighth section of the Act of 1868.

460. In constituting the county authority would you make it an appellate authority, or a primary authority for carrying out the works?—I should certainly make it an appellate authority, and I think that the primary authority should reside in the town or parish, or whatever the subordinate local authority might be.

461. (*Mr. Powell.*) I presume that in the answers which you gave with reference to the power possessed by the local authority to compel in each case the construction of waterclosets, drains, and the like, you did not mean to imply a corresponding power to enforce a supply of water to every house?—As far as I am aware there is no power to compel an owner to supply water to his house, but, as I before stated, there is a power to compel the local authority to supply water to its district, in the special case where danger arises to health from the insufficiency or unwholesomeness of the existing supply; and where a proper supply can be got at a reasonable cost.

462. Do you think that the same authority ought to be invested with power to keep the land in a pure condition, and with power to keep the rivers pure, inasmuch as the authority which maintains the surface of the land is under a strong temptation to get rid of the nuisance by the easiest possible mode, namely, by the water of the stream?—Am I to understand the question to be whether I think that agricultural drainage and town drainage should be in the same authority? You are aware of what are now called commissioners of sewers.

463. We will take what is now going on in the Thames valley; do you think that the city of Oxford ought to have an authority for draining itself, and also to be an important constituent of the county board which purifies the Thames; at present, as you know, there is a conflict between the city of Oxford, which has been anxious to drain itself into the Thames, and the authorities who are charged with the purification of the Thames, who say that Oxford shall not drain itself into the Thames. Do you think that the duty of keeping away all nuisances, and thoroughly draining the towns and other districts, ought to be imposed upon the authority which is also charged with the duty of keeping the river pure?—I do not possibly see how it can be imposed upon the same authority.

464. Having regard to an amendment of the law, the future law having the design of keeping towns and rivers pure, should you have one authority to keep the rivers pure, and another authority to keep the towns pure, or would you vest all the powers in the same body?—I would not make the conservancy board of a river the drainage authority of a town. I think that the conservancy board of a river ought to cover a very different area from that covered by the drainage authority of a town; for instance, the district of a conservancy board of the river Thames may extend to 40 or 50 miles; it would be quite impossible to say that Oxford, or any series of towns upon the banks of the river, should have authority over the whole of that district. In short I think that the conservancy of a river and the arterial drainage for agricultural purposes of a large district may well be vested in the same body, as is the case under the Drainage Act of 1861; but the sewerage of a town and the duties of a conservancy board ought, in my judgment, to be kept quite distinct, except in so far as a power should be vested in the conservancy board to prevent the sewerage authority from polluting the river.

465. In your answers as to a county board you were supposing a county authority to keep pure the river running through that county?—That is another question, namely, whether the county board should be the conservancy board for that county.

466. Does not it appear to you desirable that there should be some authority whose duty it should be to keep the river pure?—Yes. I think that no legislation ought to take place which should pollute the rivers.

467. Do you intend that the county surveyors should have a staff to go over the county?—I should myself not be competent to give an opinion upon that point. As far as I could judge, I had only intended that the county board should act when complaints were made, but of course if it were thought desirable to have inspectors there could be no possible objection to it, and the law would be more strictly enforced.

468. Have you considered whether the vestry would be sufficiently wealthy to be able to pay sufficient inspectors, taking the parish as a unit?—A small parish I think would not want an officer of that kind, they would themselves know the nuisances in that parish.

469. I presume that you intend to do away with the nuisance inspectors as now appointed by the guardians?—Yes. In large parishes I presume that they would appoint inspectors and proper officers, but in the smaller parishes they would not require them.

470. But suppose that poor law unions are broken up?—Then I would combine small parishes, and in effect they would form a large parish.

471. Can you state in what particulars you think that large towns require special legislation, so as to have a claim to the benefit of a local Act?—In a large town, where people are crowded together, you require a much more stringent law in the case of butchers' shops, and slaughter-houses, and noxious trades. A thing which is perfectly innocuous in a country district is destructive in a town. Supposing that you have a slaughter-house at one end of a country village with fields round it, it injures nobody; but if you put a slaughterhouse opposite my house in Kensington it makes life insufferable. A thing which is a nuisance in a crowded district is not at all a nuisance in a sparse district. Then there are a great many other questions of police and paving streets and roads. Indeed almost every town question appears to me to require a different legislation from what it does in the country.

472. I am comparing towns amongst themselves. Why should not there be a uniform code of law in different towns, instead of each town coming to Parliament for powers for itself?—Take the case of London, where we live under a much stricter law as respects crowding of streets; you could not carry that law into effect in a smaller town, because it is not required.

473. Do you think that there are reasons why local legislation should proceed?—As far as my judgment goes, whenever I have tried to make a general system applicable to very large bodies of men, and applicable to comparatively small bodies of men, I have found that a more stringent law is required in the one case than in the other, and I do not think that the more stringent law which is necessary only in a few cases should be made general.

474. With respect to what you have said as regards earth-closets I suppose that you know that there are other liquid deposits?—Yes. The only point to which

I directed attention was that a town should have the power to say what system it would have.

475. I presume that you are of opinion that there is more necessity that the law should interpose to secure efficient drainage than for water supply?—I take it that according to our present notions the first object of sanitary reform is to get rid of human excreta from human dwellings.

476. To a considerable extent might you not leave it to the tenant, and if there was no water he would not take the house?—In country districts people build houses recklessly where there is no water supply, and I should like to prevent the increase of that recklessness, which afterwards puts the community to the expense of providing that place with a water supply; but I do not think it of the same importance as drainage.

477. There is a very great nuisance in keeping swine and other animals?—That I think is a reason for making a difference in the law between large and small places. Keeping swine in London would be intolerable, but in a village I should have no objection to a man keeping his pig.

478. But it must be so as not to cause a nuisance to his neighbour?—It is a question of degree as to how far a pig is a nuisance.

479. You would maintain the law which now exists, which prevents any man from keeping a pig or other animal which is a nuisance to his neighbours?—I unquestionably would not diminish the law which now exists.

480. (*Mr. Cave.*) How do you propose that the county board, or whatever would be the central authority in the county, should oblige the vestries to do their work?—I think that if the vestry do not do the work the county surveyor must be sent, and a rate raised in the parish to pay the expense.

481. Then you would give power to the county board to send round to the different parishes to see whether there was any necessity for action, in the first instance?—I have not sufficiently considered the question to give an answer. I think that probably it would be sufficient to act upon complaint; but if not, I would give power to the county board to send down an inspector.

482. In the case of the country, I allude to parishes which only consist of farmers who would set themselves against spending money?—In that case I should have hoped that the country clergyman would have complained, but I should think it very desirable that the county authorities should, if it be thought practicable, carry on a system of inspection.

483. Will you mention a little more in detail your objection to the overcrowding Act?—I think that it is too stringent in its language. As a matter of fact that Act cannot be carried into effect in a great many places, and it is neglected. I think that a law with less stringent terms can be carried into effect better than a more stringent Act. I can hardly imagine any case in London in which poor people do not live in a house which in one sense is prejudicial to health. If they had larger houses they would be healthier.

484. You would simply enforce the law where the overcrowding was dangerous to health?—Yes.

485. Leaving out the word "prejudicial"?—Yes.

486. But you would enforce the law with respect to overcrowding?—I think that overcrowding is the greatest possible evil existing. As far as I know, if you could find proper lodgings for labourers you would resolve the most difficult problem of sanitary reform.

487. You have to choose between turning out in many cases the people altogether and too many living in one house?—Yes, they either cannot get new houses, or they must put up with inferior houses, and if you make the houses better in construction they then become dearer, and you shut out the poorer classes from those benefits.

488. There being no sort of law which will compel people to provide dwellings at all?—I do not think that that is possible. There is a law in one sense; there was an Act passed last session, namely, the Artisans and Labourers Dwellings Act.

489. That simply gave facilities?—It gave facilities to large communities to close houses unfit for dwelling, and to build others.

490. (*Lord Robert Montagu.*) I gather from your memorandum that the definition of a nuisance at common law is different from the definition which is given in the various sanitary statutes, is that so? You say in your memorandum that the definition of a nuisance at common law is "anything that is either "injurious to health, or so offensive as to detract "sensibly from the enjoyment of life or property in "the neighbourhood." None of the statutes take the definition of the common law, namely, "that it is "either injurious to health or so offensive as to detract "sensibly from the enjoyment of life or property." All the statutes regard a nuisance as that which is injurious to health?—Yes; the statute law differs from the common law.

491. Would it be well to extend the definition of a nuisance in the statute law so as to be as large as the definition of a nuisance in the common law?—The object of the statutory definitions is to bring certain specific cases within the purview of the magistrates. The sums of money involved in some of the cases of nuisance arising under the common law definition are so enormous that you could not possibly submit them to the jurisdiction of the magistrates. There are no subjects which raise so many questions as common-law nuisances.

492. Is this the reason which you would give against the assimilation of the two definitions, that the definition at common law is meant to cover cases where only large amounts can be recovered, while the definition of the statute law is meant for the jurisdiction of the justices of the peace?—It would be impossible to place within magisterial jurisdiction the questions that frequently arise at common law, because they involve most difficult questions of fact and of property and of injury to trade.

493. The statute law I suppose in no way overrides the common law?—In no degree.

494. Do you think that a consolidated statute should be obligatory, or that a consolidated statute should be permissive like the Local Government Act?—At the present moment the main sanitary provisions of the Local Government Act, or similar provisions, are obligatory everywhere; whether you should extend further those obligatory provisions might be a question.

495. Would you make a consolidated Act a general and compulsory Act, and yet insert in it some provisions which might or might not be adopted according to the wish of the locality?—I think that the drainage provisions properly so called are necessarily obligatory, but whether you should put them in a separate Act, or whether you should add to them permissive provisions is a question of how a bill should be brought in; it depends upon circumstances.

496. At page 14 of your memorandum you suggest that all manufactories set up after the passing of the Act should be summarily punished if they pollute a stream, but that all existing manufactories should be compelled in all cases to do merely what they are compelled to do by the Salmon Act of 1861, in the case of salmon rivers, namely, to use the best practicable means at a reasonable cost to render their liquid refuse harmless. Is that your opinion?—Yes.

497. Why should not existing manufactories as well as future manufactories be summarily prevented from committing a nuisance and fouling the river?—On account of the great interests involved, and the impossibility in many cases of stopping great manufactories, I would leave them to the mercies of the common law, and if you can properly stop them you may do so. The law of England allows a man after a certain number of years of user to acquire a right which is offensive to his neighbours. Probably at first there were no buildings round an offensive manu-

Henry Thring, Esq.

29 April 1869.

factory; since then a population has grown up around the manufactory, and it has become a nuisance.

498. Is there any right of prescription against the common law of nuisance?—Practically you do not get a verdict if a man has had the user. I believe that you cannot prescribe against an indictment for a common law nuisance, but practically there is no means of stopping nuisances which have been long in operation, and I believe that it is impossible to get a verdict.

499. Then should we not alter the statute law so that you might get a verdict there as you may fail under the common law?—I think it impossible to make a general law that would be entirely satisfactory with respect to offensive trades. They must be carried on somewhere, and each case must stand or fall by its own circumstances.

499*a*. Are you aware that these very terms, namely, "the best practicable means within a reasonable cost," were put in the Salmon Fishery Act of 1861?—Yes.

500. And are you aware that Mr. Ffennell, the salmon fishery commissioner, stated before the Sewage Committee of 1864, in answer to questions 2934 and 2941, that these expressions were so vague as to make the whole Act inoperative in that respect?—I daresay that he did.

501. Then would it not be equally inoperative if we put them into a sanitary Act?—No. I think that in a great many cases, if a manufacturer thought that he was injuring his neighbours, and was liable to be summoned, he would use means to abate that nuisance. Under the Salmon Act I do not believe that it has been wholly inoperative.

502. Is there any difference between public and private nuisances?—A public or common nuisance is one which affects the public, and is a nuisance to all the King's subjects; for example, an obstruction to a highway is a public nuisance. A private nuisance is anything done to the hurt or annoyance of the lands, tenements, or hereditaments of another; for example, obstructing a private watercourse would be a private nuisance. (See 1 Russ. by Greaves, 435.) A public nuisance may be actionable as a private nuisance, if a particular person proves that he is damaged by such public nuisance to an extent beyond the rest of the community.

503. You have spoken of an authority which should be superior to the local authorities of towns, but which should still be under the central authority, and you have suggested county boards, have you not?—Yes.

504. Do you not think that for the management of a river and watershed a conservancy board would be far better than a county board?—Yes, for a river and watershed, but not for the sewerage of a town.

505. Do you think that the county boards would be better than conservancy boards?—I think not for the management of a river as such, because a river usually runs between two counties and divides the counties, and I cannot imagine that you could conveniently place the jurisdiction in a body which would only have it *ad medium filum*. As a general rule I think that a county board would not be a good river authority, for the obvious reason that generally the river is only partially within the jurisdiction of that board; but there may be cases in which a county board could properly superintend a river.

506. The jurisdiction over shipping in ports must take in a great extent of river, far more than the part within a county, for instance, 50 miles of river, as in the port of London?—Undoubtedly. If you take large ports, such as London and Liverpool, and other large ports, I do not for a moment contend that the county board should have jurisdiction over the river; on the contrary, I think that the sanitary powers over the river and the shipping ought to be taken away from the riparian towns and vested in a conservancy board.

507. Then would you not make such a conservancy board answer the purpose instead of the county board, which you were just now proposing?—In the case of tidal rivers, and ports so far as respects the shipping, I would make the conservancy board or harbour authority the sole sanitary authority. A conservancy board would in no degree perform the duties which I have alluded to of a county board, and on the other hand I would not give a county board the duties of a conservancy board.

508. I understand you to say that the conservancy or watershed board should have the control of the river with regard to pollution, and stoppages by weirs and dams, and so forth?—Yes, if there be a conservancy board, but not so as to produce a conflict between them and the riparian town authorities.

509. Could not a conservancy board over a whole watershed also take the duties of inspection and rating, and so on?—No doubt you can give a conservancy board the power of rating for conservancy purposes.

510. Do you think that a watershed or conservancy board could inspect nuisances of all sorts, and also carry out works of sanitary improvement throughout the whole river basin?—I wish to guard myself from expressing any opinion as to the propriety of appointing conservancy boards as contradistinguished from county boards. Where there are conservancy boards in ports, such as London or large towns, I can conceive that it might be proper to allow those conservancy boards a sanitary jurisdiction over ships, and over the men in the ships, but I do not consider, as a general rule, that there is any analogy between what I call conservancy boards and what I call county boards, and I cannot conceive, as a general rule, how a conservancy board is to perform the duty of a county board, or how a county board is to perform the duty of a conservancy board.

511. Then I gather from your answers that you would have neither board?—On the contrary I would have a conservancy board where required and a county board in all cases.

The witness withdrew.

(3.) Robert Rawlinson, Esq., C.B., C.E., examined.

512. (*Chairman.*) Will you state what official appointments you have held which specially qualify you to give an opinion upon the subjects of our inquiry?—I was one of the first inspectors under the "Public Health Act, 1848," and made many inquiries under that Act up to the time of the Board of Health being broken up: I was subsequently sanitary commissioner to the British army in the Crimea in 1855: A member of the royal commission which sat for about seven years, namely, from 1857 to 1865, inquiring into the best means of applying sewage beneficially for agricultural purposes: and I am now chief inspector under the Local Government Act of 1858; as also a member of the Army Sanitary Commission connected with the War Office. I was chairman of the Royal Rivers Pollution Commission, and sat during the publication of three reports, namely, those upon the river Thames, the river Lee, and the rivers Aire and Calder: I was also government engineer for the Lancashire public works, which extended from 1863 to 1869.

513. What is your present office?—Chief inspector in the Local Government Act Office. I also occasionally report for other departments. I have inspected the different waterworks over Lancashire and Yorkshire for the Home Office; and I have inspected lunatic asylum works for the Commissioners in Lunacy.

514. As inspector under the Public Health Act of 1848, how did you conduct your inspection?—The Public Health Act of 1848 was both permissive and compulsory; it could be adopted by any place, after going through certain forms, and inquiry could be made compulsory if the mortality exceeded a certain number (23) per 1,000. The Act could be put

in force upon petition from one-tenth of the ratepayers. That Act was worked by commissioners, the first commissioners being Lord Morpeth, Lord Ashley, with Mr. Edwin Chadwick, and subsequently, on the outbreak of cholera, Dr. Southwood Smith. There were four inspectors, of whom I was one. The inspectors were not salaried officers, they were only appointed for that special work, and were paid by the day. The inspectors held inquiries after notice, as prescribed in the Act, and received evidence, and the reports in all cases were published and were circulated in the district. Those reports generally concluded by recommending certain works. The inspectors being engineers, where the local authorities chose to employ them they did so and in many cases carried out the works, which created a great deal of jealousy and ill-feeling, and the end which I had foreseen came, namely the breaking up of the board.

515. Did the petition always come from the district?—Yes.

516. We may understand that generally you think that the Act of 1848 broke down from the inspectors being employed in undertaking works, and not upon salary?—At that time there was a strong out-of-door feeling upon the question of brick sewers and earthenware pipe drains. There was a strong antagonistic feeling in certain quarters against the General Board of Health, and against the views which were enunciated in minutes of instruction which were published by the board of 1848 upon water supply. Exception was taken to the inspectors, and it was said that they interfered with the regular course of the profession, and accusations were made in official documents which were libellous and injurious to the inspectors, and the government of the day broke up the board.

517. As inspector under the Act of 1858, what are your duties?—They are very similar to those under the Act of 1848. The inspectors now hold inquiries upon petition from the locality, the distinctive difference being that we do not publish any reports; and these are brief, they are simply to advise the Secretary of State for the Home Department as to whether the plans and estimates of the works as submitted should be sanctioned. The inspectors hold inquiries for several purposes. First, as to setting out boundaries to form new districts, then as to the adoption of the Act in any district, and subsequently as to the carrying out of works. Plans and estimates are sent to the Home Office, and these are submitted to the inspectors. We make inquiries into the population, as to the rating of the district, as to the mortality, and make our report accordingly. We look over the plans and check the estimates, but we are not in any degree responsible for those plans or estimates.

518. Can they be carried out without your approval?—Yes; if any boards wish to carry out their own plans out of current rates, they need not come to the Secretary of State; but if they want to mortgage the property of the district it brings them under the provision of the Act; they must come to the Secretary of State to raise that money on mortgage. If the plans are notoriously bad we recommend amendment, but we might recommend the Secretary of State not to sanction those plans, we very rarely however interfere with plans unless they are decidedly objectionable.

519. Do you inquire into the estimate?—Yes.

520. Is the work in your department increasing?—Yes, very rapidly increasing.

521. Will you state what are your duties under the Sanitary Acts and the Sewage Utilization Acts?—They are very similar to those under the Act of 1858. There are certain new clauses as to compelling works to be carried out in sewerage districts, but I have not made any inquiries as yet under those provisions, my engagements under the Rivers Pollution Commission, and under the Lancashire Public Works Act, having kept me away from holding inquiries under those recent Acts. I may say, however, that I do not agree in the compulsory clause (the 49th section of the Sanitary Act, 1866).

522. To what clause do you allude?—I allude to the 49th section of the Sanitary Act, 1866. This Act authorizes the Secretary of State, in the event of a nuisance authority or a sewer authority declining to carry out proper works, to appoint an engineer to devise, estimate, and carry out those works and to levy the expenses upon the rates. The clause has been put in force in several cases, but not by myself, and I think that if I were desired to do so I should decline the task.

523. Upon what ground?—Because I can only see as the result confusion. Under the Local Government Act there was occasionally a local board elected by an active and intelligent minority, which having the power devised works, but there was a strong majority opposed to them, and these local boards being elected annually, the majority at the first opportunity destroyed the works devised by the minority, and so brought matters into confusion; and I made a vow that nothing should force me to attempt to compel a community to do what was even for their own benefit.

524. Will you state generally your experience as government engineer, under the Public Works Manufacturing Districts Acts in 1863 and 1864, in Lancashire?—The Public Works (Manufacturing Districts) Act is based upon the Public Health Act of 1848 and the Local Government Act of 1858. The great alterations which were made were in shortening the time, and in enlarging the provision for enabling local governing bodies to undertake works not provided for in the Public Health Acts, and a great incentive was a government loan at a low rate of interest, the repayment extending over 30 years. The Public Works (Manufacturing Districts) Act further enabled local authorities to carry out private improvements as well as public improvements.

525. Was not the object of the Act with which we are now dealing to enable boards of guardians to obtain loans for public works, owing to the closing of the mills and the manufactories on account of the American war?—No doubt it was to enable the locality to borrow money from the Government at a low rate of interest, to carry out such works as the distressed men could be employed upon; and in Lancashire a very large body of distressed men were so employed. The works were devised, were superintended, and were executed by the local engineers of Lancashire. Plans were forwarded to the Poor Law Board, and upon my report were sanctioned, and the money was advanced by instalments upon my subsequent reports. This was to see that the money was applied to the purposes for which it had been borrowed.

526. How far do the operations under this Act show the capacity of local authorities to undertake those works, and to borrow money for those works?—So far as my experience went the boards of guardians did their business as well as any other bodies.

527. Did they also undertake drainage, well-sinking, water supply, and other works of that sort?—Yes, and where any local board or board of guardians could agree with any adjoining landowner, they undertook works of land drainage and other works.

528. Will you name the cases in which boards of guardians have undertaken works?—The details are given in the Final Report on Public Works, Lancashire, 1869, and I am not aware that there has been any failure in any instance on the part of the guardians.

529. What was the largest amount of money expended in any case by any corporation or board of guardians?—Accrington expended 197,000*l.*; Bolton borrowed 177,974*l.* and Blackburn borrowed 184,000*l.* Manchester borrowed 155,000*l.*, namely, 130,000*l.* for water supply, and 25,000*l.* for sanitary purposes. Stockport borrowed 59,396*l.*; 25,493*l.* for sewerage works, 28,883*l.* for road and street improvements, and 5,000*l.* for other improvements.

530. Have you any other remark to make as to the bearing of these Acts?—No, excepting that I think that there should be a consolidation of the Sanitary Acts, leaving out the compulsory clause requiring the Home Secretary to devise works, find the money,

Robert Rawlinson, Esq., C.B., C.E.

9 April 1869.

execute the said works, and levy rates to repay the same.

531. As you have been a rivers pollution commissioner, what opinion have you to offer as to the formation of conservancy boards?—The river pollution question is necessarily a complicated question. In the reports we, however, went very fully into that subject. (See Third Report.) This (No. 1) is a sketch map showing the area of the river Ouse. The part coloured pink is the Aire and Calder. It is a part of the Ouse basin, but it is a distinct watershed. No. 2 is a geological map of the Aire and Calder basin or West Riding district.

532. To what river basins did that report refer?—The report which I hold in my hand, No. 3, is a report upon the Aire and Calder rivers, the seat of the great woollen and worsted trades of England. No. 1 map shows the Ouse basin. No. 2 map shows the geology of the Aire and Calder. No. 3 map divides the Aire and Calder district into 10 conservancy boards, having the principal town in the centre of each district, the areas and the population being given upon the map. My idea is that the whole of England should be put under a national conservancy board, but that the several river areas should be put under sub-conservancy boards, comprising (for large rivers) the whole watershed of each river, but where there are small rivers, or in agricultural districts, there should be a conservancy board for a combination of smaller rivers. I think that where the great trades are carried on, as in Yorkshire, upon the Aire and Calder, and in Lancashire, upon the Irwell and the Mersey, and also in South Wales, and upon the Trent, you should subdivide river areas; and that to adjudicate upon all questions connected with conservancy laws there should be a board to prevent the abuse, pollution, and nuisances which now take place in rivers.

533. Then I understand your scheme to be a scheme for the local government of the kingdom by conservancy boards?—No, not exactly so. Local government for sanitary purposes should remain as at present. Conservancy boards must be established for conservancy purposes, but where there can be mutual assistance there should be the combining legal authority. You have the basis in the Local Government Act; as in every town under sanitary law you have a local board, but whose limits are confined to a defined area, comparatively small as compared with the river drainage area. For instance, No. 4 map is a map of the river Calder, having Huddersfield as its principal town in its watershed. That is put in to show how complicated this question is; but in my opinion Huddersfield should take in that district; and in the evidence of Mr. Abbey, the surveyor, all the details are collected which have reference to that special area.

534. I think that you stated that the boundaries of such a conservancy board, would not, in many cases, coincide with the local board limits?—No.

534. Would you not have considerable difficulty in raising rates within such an undefined boundary?—I think not, because it would become a defined boundary.

535. That is to say, the watershed?—Yes.

536. But it is not now defined?—I agree that it is not defined at present. In this district (Huddersfield) there are many local boards, and I think that you should leave those local boards intact. Let them administer their own local affairs, but let them be represented in the larger conservancy board. At present, although there is the common law of the land, which ought to prevent nuisances, we know that in these districts the common law of the land is neglected, and that many riparian owners choose to exercise their authority to their own benefit and to the injury of everybody else. I would abstract from the riparian owners any power which interferes with a public watercourse, which I did not consider also beneficial to others. A man now interferes with a stream, fouling that water, polluting the stream, to the great injury of everyone below him.

537. What would be the advantage in your mind of referring to an entirely distinct board for the prevention of the pollution of rivers, all the subjects of local government, rates, and so on?—I do not propose that you should mix up the two; but I would let the local boards in each of these towns be represented on a conservancy board, and I would have justices *ex officio* members.

538. Do you see any advantage in that special board, formed for the prevention of pollution of rivers, exercising the duties of ordinary government?—The conservancy boards would not exercise the ordinary powers of local boards of health, which are now confined within their own small areas. I would in some cases make a special conservancy board for each river area or combined river areas, and in other cases subdivide where population and manufactures are dense.

539. For what object would you make such a board—for anything besides the pollution of rivers?—Yes. The enforcing of the smoke prevention clauses of the Act of 1866; as an inspector of water pollutions may also inspect air pollutions at the same time, and the repressive power would not, as in town councils, be administered by those who most offend.

540. (*Earl of Romney.*) I understand that you were sent down to Colney Hatch to inquire into the system of earth closets?—I was; the justices proposed to take out the water closets and substitute earth closets. Before the Commissioners would sanction that, they submitted the whole scheme to myself and Mr. Howell, the architect, and we examined into the question of earth closets, as to whether they were appropriate for such purposes, and we reported to the Commissioners in Lunacy.

541. What was the effect of your report?—The effect of our report was that earth closets, as designed, might be a greater nuisance. The ordinary hopper earth closet is, for public purposes, a failure in many places.

542. (*Lord Robert Montagu.*) Your whole proposal I suppose rests upon this, that you would substitute natural boundaries for the present conventional boundaries, which have had their origin in mere accident hundreds of years ago?—Certainly.

543. Would you give the conservancy board the power to make arterial and town drains?—Arterial drains, but not town sewers. I would submit plans from the local board, for the sanction of the conservancy board.

544. Just as the vestries in London do as regards the Metropolitan Board?—Yes.

545. (*Mr. Cave.*) In what manner would you deal with mill-owners in these watersheds?—I would put them under restrictions that they should not discharge refuse as they do now. Their excuse now is that they take mud with the water from the river and that they send it back, but the result is that they foul the stream.

546. Is not the existence of mills prejudicial to the river?—Mill dams and ponds do injure rivers, and block land drainage in very many places, and in the West Riding of Yorkshire, as in Lancashire, as also in South Wales, there can be no question that many manufactures block with solids and pollute with fluids.

547. I mean as regards damming back-water?—It depends upon the character of the district.

548. Would it be very difficult for such a body as this to raise money for such a purpose?—I think not.

549. In the Lee River Act is there not such a power?—Upon the river Lee the mills have been from time to time bought up; there are some upon the Stort navigation, and no doubt those mills will be dealt with by removing them.

550. How is the money raised for carrying out that Act?—By tolls upon the navigation.

551. There is no rating power?—No, no adjacent land rating power, and that is the great defect in the Thames Conservancy Board, namely, that they have not sufficient funds to carry out what is necessary.

552. (*Mr. Powell.*) When you say that you would leave out the compulsory clauses, do you mean that you would leave it optional, or that you would give the power to the Home Office?—From my experience I think that you cannot enforce those executive clauses; for instance, supposing the Home Secretary sends down an engineer to devise and to carry out works in a parish, he must estimate the cost of those works, and the money must be provided. I have had experience enough in engineering to know that no man can estimate what sewerage or water works will cost within anything like the ultimate price. They differ from 25 to 300 or 400 per cent. When the Secretary of State has been advised by his own engineer that the cost of works will be 10,000*l.*, they may perhaps cost 30,000*l.* Estimates are doubled and trebled, and sometimes quadrupled, and the parties may then say, "we decline to pay for such work."

553. By what machinery do you propose that the watershed area which you describe should be set out by metes and bounds?—There will be no difficulty in defining watershed areas upon the Ordnance map.

554. Would you not want an officer of some kind?—The Ordnance surveyors would do it very rapidly.

555. I presume that you are of opinion that you must have authority to keep the rivers pure, and to see that the regulations are carried out?—Yes, you may constitute a conservancy board by taking one or more members from local boards, who, with elected riparian owners and certain nominated justices, may constitute a conservancy board, which shall have jurisdiction over a distinct area.

556. In the River Lee Conservancy Act the chairman and other members were made members of the board?—Yes; but the authorities of the river Lee being a trading body are very different from the authorities necessary for other rivers. Every gallon of the water of the river Lee is appropriated.

557. Would you give the same power to these bodies over the same district. The duties of a conservancy board will be modified by the character of the watershed. On the Lee some part is navigable and another part is unnavigable?—Parliament has given the River Lee Commissioners jurisdiction over that whole area, and that is the first instance in which Parliament has given conservancy power over an entire river basin.

558. Where the river is navigable there are restrictions against placing obstructions, and so on?—Yes, and there is a provision at Luton that works above the intake shall be made to clarify the water by the best possible means.

Robert Rawlinson, Esq., C.B., C.E.

29 April 1869.

559. Are you aware that you last year gave evidence to a rather contrary effect?—I gave evidence to the effect that above the intake of the water for domestic purposes by the New River and East London Waterworks Companies, the sewage should be passed over land for irrigation purposes; but that below such intake, abstraction of solids and clarification by the most approved chemical means should be sufficient. I gave the strongest evidence against the admission of even chemically clarified sewage at Luton above the intake of the New River Company.

560. Have not the efforts of the Home Office been very ineffectual in curing smoke?—We have not had much experience as yet. The Smoke Act specifies that smoke shall be prevented, and any person may petition the Home Secretary, who is to institute an inquiry. That Act is in force throughout the whole kingdom; but to expect that members of local boards and of corporations, the majority of whom are smoke makers, will carry out the provisions of the Act, is too much. The county police, in my opinion, should be made the smoke inspectors, and wherever there are stipendiary magistrates, I think that they should settle all such cases.

561. Under the 49th section of the Act of 1858 the local authorities can be compelled to carry out that smoke clause?—The smoke prevention clause is in one of the recent Sanitary Acts. We have had several inquiries under it. I made an inquiry at one place, but the mayor would not attend. Nothing is easier than to prevent smoke, if the proper regulations are carried out, but it is more a fireman's question than anything else.

562. In the conservancy board you think that there should be the principle of combination rather than of separation?—It would depend entirely upon the extent and character of the watershed.

563. Suppose that these different bodies declined to act together, you could not force them to do so?—If you make it legal for them to constitute themselves into a local conservatory board you would have the same machinery as you have now.

564. Supposing that they declined to act, could you compel them to do so?—I think so.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

Monday, 3rd May 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.
The EARL of DUCIE.
The Right Hon. LORD ROBERT MONTAGU, M.P.
The Right Hon. STEPHEN CAVE, M.P.
Sir THOMAS WATSON, Bart., M.D., F.R.S.
Lieut.-Colonel EWART, R.E.
JOHN TOMLINSON HIBBERT, Esq., M.P.
EVAN MATTHEW RICHARDS, Esq., M.P.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
JAMES PAGET, Esq., F.R.S.
HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
JOHN LAMBERT, Esq.
FRANCIS THOMAS BIRCHAM, Esq.

(3.) ROBERT RAWLINSON, Esq., C.B., C.E., further examined.

Robert Rawlinson, Esq., C.B., C.E.

3 May 1869.

565. (*Mr. Powell.*) In speaking of the great conservancy boards and the subordinate boards you have not in any way defined the powers that you propose should belong to those two classes of authorities—are you able in a short compass to sketch out the powers which you would propose to give to each?—I think not in evidence, because the duties would be new, various, and of so important a kind, that I should not like to venture to give such information in evidence. I did sketch out in preparing the Aire and Calder report my notions of those duties, but they were not embodied in that report, as it was decided that the Commission should continue the inquiry and go on with the Lancashire district; but I may say generally that my notion of the duties of conservancy boards would be this—that they would not necessarily be mixed up with public health duties, but would have jurisdiction over an entire watershed. Then, where the area was large, and complicated with manufactures, it would be broken up into sub-conservancy districts, and the subordinate boards would have jurisdiction over one such sub-area and would have

Robert Rawlinson, Esq., C.B., C.E.

3 May 1869.

control over the waters, and over works situate upon those waters; this sub-conservancy board taking cognizance of riparian rights as they now exist. Rivers and streams are frequently the divisional lines of townships, parishes, and counties, and they are frequently the divisional boundaries of properties; but streams are constantly altering, wasting one bank, and making another; and there is no generally recognized law to rectify such altered boundaries, or even to stop a man from abusing his riparian right as he thinks may be to his own advantage, although to the disadvantage of his neighbours. For instance, in Wigan, a man assumes that his boundary is in the centre of the river Douglas, and he builds a mill upon that centre line, thus occupying half the bed of the river. Now there is no constituted local power that shall step in and stop him from doing that absurd thing; and if the opposite riparian owner exercises the same right, of course the whole stream is blocked up, and therefore I think that conservancy boards should have separate and special powers distinct from those of local boards of health.

566. Speaking generally, was not this your idea, to give to the sub-conservancy board complete authority over its own district?—Over its own district, and if possible and practicable, I would give it authority over all dams, retaining-walls, sluices, and river-works, even though on private properties, because such works affect the main stream.

567. You would give, would you not, the conservancy board something in the nature of an appellate authority, saving certain exceptions, over the sub-conservancy board?—Yes, in cases of dispute and also for works; for instance, parties might appeal to the superior board, just as in the case now of the Local Government Act. If works are to be carried out they are devised by a local surveyor first, and when matured by him they are sanctioned by the local authority, and when the district property has to be mortgaged for money to execute the works, plans and estimates come to the Home Office for sanction; there is then an independent inspection by the inspector, and the sanction of the Secretary of State before the money can be borrowed; but if any local board wishes to carry out sanitary works or works of any kind, and the Secretary of State vetoes the plans and estimate, that board is at full liberty to carry out those works by levying the cost through a current rate.

568. You would probably consider that there would be some works of a structural character affecting the whole stream which should generally be first planned by the conservancy board?—No doubt, as for instance, on the Aire and Calder, or on the Mersey and Irwell, supposing it should be considered necessary in the locality that there should be an intercepting sewer to run parallel with the course of the main river to pick up at all the various points the numerous pollutions that now pass into the stream and pollute it, the chief conservancy board would have to combine all the districts, and would have to devise a rating area over which to levy a rate for the cost of the construction of the work, and the conservancy board would have to superintend the execution and the maintenance of such a work, and that would, necessarily, come before the main conservancy board. The sub-boards might devise and the main board consider and sanction or veto any scheme submitted.

569. In dividing the country into watershed basins with a view to the action of conservancy boards, would you place under the same conservancy board the valley of the Ouse as you have shown it in your sketch map in the report, together with the Aire and Calder, or would you place under one conservancy board the basin of the Aire and Calder alone, dividing that district of the Aire and Calder into sub-conservancy districts?—My idea is that the entire area of the Ouse basin, large as it is, should be under one river Ouse conservancy board governed as a county is governed, elected magistrates, elected riparian owners, and the chairman of each local board of health electing one-third of the conservators, and then that you should subdivide that larger area into practicable working sub-areas.

570. Do you propose any communication between these sub-conservancy boards and the sanitary authorities in the different towns, so that each authority may know what the other is doing?—Yes; I imagine that where, as in the Aire and Calder, and in the other great manufacturing districts when they are divided into sub-conservancy districts, the sanitary authorities of that district shall be represented upon the sub-conservancy board, and the surveyor of that sub-district may, if appointed, be also surveyor for the conservancy board of that district, the duties being analogous and similar. The inspectors of nuisances may also be the officers of both boards.

571. (*Mr. Richards.*) You heard Mr. Thring's evidence on Thursday, I think, and his reply to a question which I asked him as to the sufficiency of the powers for drainage; are you of the same opinion as Mr. Thring that the powers already in existence are sufficient?—I assume that question will have reference to combined back-drainage. There are not sufficient powers in any Act of Parliament giving the local board authority to execute combined back-drainage. I know that many places have been fettered in the attempt to carry it out, but my opinion is, that it would be a very proper authority, and might be exercised with very great advantage to the locality, saving money and giving efficiency to house drainage works.

572. Can the system of subordinate sewers be properly carried into effect without such power?—No; excepting at a very large cost and very great inconvenience. If you do not drain the back premises by the back way, each back premises must be drained through each person's property, through the basement beneath the floor, which is a most expensive and a very improper sanitary mode of doing the work.

573. You have spoken of the mode in which money was lent to the distressed manufacturing districts under the Public Works (Manufacturing Districts) Act, 1863; are you of opinion that if local boards could obtain money at a similar rate and upon similar conditions it would be a great incentive to local authorities to carry sanitary works into operation?—It would. The very fact that money was advanced in Lancashire at a low rate of interest, not only facilitated the carrying out of works but was the great incentive and inducement to that extent of work being carried out; and I know many places now where they are hindered from attempting works because of the difficulty of borrowing money upon reasonable terms. If they are forced into the open market they must in the face of a low rate of interest in other places pay five per cent., and when it has to be returned within 30 years it becomes a heavy burden upon the community. Then if they attempt to borrow it on easier terms they have to break up their loan into small bonds, made renewable at short intervals, and that entails so much book-keeping, so much collecting, and so much trouble, that that it is risky and expensive. The simple action of the State in advancing the money to Lancashire at 3½ per cent., and advancing it in the manner that it did, gave facilities to local authorities to carry out sanitary works. They have carried them out, and they have expended nearly 1,800,000*l.*, and if the Exchequer Loan Commissioner were asked the question, you would find that punctually, quarter by quarter as the terms come round, every local board is paying its current interest and is repaying its equivalent portion of the capital. I may state, however, that notwithstanding there is a strong objection by some government officials to making the government a banker for the country; there is a feeling that it should not be done; but I consider that the consequences of a neglect of sanitary works have been and are to foster vice and crime, and that it cannot be straining the duty of the State to lend money at a low rate of interest to promote works which shall diminish these forms of evil.

574. Do you think that it would be desirable to intrust local authorities with more general powers than they have at present over waterworks companies, where it is desired that water should be used for

sewerage purposes or for flushing purposes?—I think that it is of the greatest possible advantage to enable local authorities whether corporations or local boards to be the possessors of their own waterworks, and that the State should give them all necessary facilities for acquiring such public works. At present, as the Commission is aware, the law makes it very difficult for a local board to establish waterworks if there are any established rights in the way; and I do not exactly see how you are to make it different, as persons who have vested interests must be paid such sum as an arbitrator may award; and I cannot see my way to reducing expenses excepting by aiding local boards to acquire those works, even at an extravagant price, by a loan at a low rate of interest, the security for which shall be ample, and on which loan there shall be no loss to the State.

575. You have stated to the Commission generally that you object to putting compulsory powers into operation where local authorities have neglected to do works that may be considered desirable for their localities; are you of opinion that if the appellate authority were removed from the Secretary of State to a county board that would mitigate the objection that you have?—My objections to the compulsory powers that were spoken of when I last gave evidence simply go to this, that the 49th Section of the Act of 1866 makes it imperative upon the Secretary of State, if required, to appoint an engineer to devise works and to execute them. It enables him to raise money for the carrying out of those works, to appoint a receiver, and to levy the rates over a period of 30 years, or as far as the loan extends. My answer must go to that single clause and to those powers. There will be very great difficulty in carrying out that clause, because serious complications come into all operations connected with main sewers and waterworks. The first difficulty would be for the Secretary of State to find a proper and fit person. In the second place, when he has found that proper and fit person, and such engineer has estimated the works, though he may be the ablest man that ever devised works, the weather or the subsoil, or something or other connected with those works, may make them cost several times as much as the estimate, and then how the Secretary of State through his appointed agent is to levy an extravagant rate over a number of years upon an unwilling community without very great torment and trouble, I cannot imagine. But if such powers are delegated to a local representative body answerable locally to the ratepayers, and the Secretary of State has merely the legislative power of putting the machinery in motion, you may give him the power of fining the district if it will not carry out proper works, fining the ratepayers continuously, week by week, until some local authority executes the works; then I think you may get over the difficulty; but you cannot in my opinion make any Government department of this country executive without risk (nay certainty) of money losses and of doing mischief directly and indirectly.

576. (*Mr. Bircham.*) Your objection to compulsory powers of that description would be rather from the difficulty that the central executive body would have in enforcing them?—Yes, as if you make a state department executive it must bear the responsibility, and that will, in my opinion, inevitably entail loss upon the state in attempting to carry out works.

577. You are probably of opinion that there must be some compulsion resting somewhere upon a district?—Yes, you have compulsory powers spread through the different Sanitary Acts, which can be put in force by the local authorities which represent a district, and I have not one word to say against those powers.

578. There is no such general local authority now, I believe?—There may not be in all places. You may say that some places suffering from preventible disease and where works are required refuse to set up a local authority; even in such cases I cannot see my way to a government board devising and executing works.

579. My question had more particular reference to rural local government. A sewer authority is in existence in every parish?—Yes.

580. And therefore there is a local authority there to act upon; they cannot refuse to be in existence?—If you can take the bench of magistrates, or the guardians, or any recognized local authority, and having armed them with power to put the Act in force and to levy rates, so as to relieve the Secretary of State from all but the legislative power, then I say do it, but do not require the Secretary of State to appoint engineers to supersede and override local authority and local obstinacy, to be in fact the executive.

581. Do I understand your view to be this—that the last resort rests in the wrong hands?—I think that the power in the 49th section will be found to be unworkable.

582. You would be of opinion that there must be some compulsory power resting either locally or elsewhere?—Yes; I would take those powers first as they stand, but I would shift the executive power somewhere else away from the Home Office.

583. Do you think there would be the same sanction if the district or the local body were carrying out the power which you deem so offensive, in comparison with its being carried out by the central authority of the kingdom?—Taking it generally I should say that the greater proportion, far more than a moiety, of local feeling, would be strongly in favour of having the execution of their works forced upon them by some local authority rather than by a government board.

584. If I understood your plan of the distribution of the country for health purposes, you propose that it should be divided very much according to the watersheds?—No, I beg pardon, that is not my opinion in any degree.

585. Are the Commission to understand that the evidence which you have given has reference to the drainage and to the preservation of rivers, and not to considerations of health?—My answer with regard to conservancy districts has reference purely to the rights of water and to the area from which the water flows, and combined with that, so far as health is concerned, the prevention of pollution, but not beyond that.

586. In your evidence on Thursday I think you stated that you had no idea that the smaller watershed authority should be generally the health authority of the district?—In drawing up the conservancy scheme, I am not prepared to say that there may not be areas of that class, character, and size in which the two might not be concurrent, and in which you might not combine the two. In the large areas unquestionably you could not do it.

587. You have stated that it would be very easy for a Government engineer with the ordnance map to map out the country into watershed districts; had that answer of yours reference to purposes of health?—No, simply for conservancy and river pollution questions, and not necessarily for town local government questions.

588. Therefore we are to understand that as far as any consideration as to what is the proper unit to form the local health district is concerned, your evidence has not been applied to that subject?—No.

589. Has your experience led you to consider at all what would be the proper local authority for the health district as a unit; I am speaking of rural districts, ex-towns?—Yes; but that really is a very difficult question. As you are aware, first of all there was power under the Public Health Act, and now there is power under the Local Government Act and under the several Sanitary Acts to define boundaries for local boards, and we have been constantly doing that.

590. You have no power to group parishes, have you?—I am not fully aware what the nature of the powers are in the several Sanitary Acts. I think upon petition we could even group parishes. Supposing that a town or community has grown up in a certain situation, and that its required boundaries may run within parish and township boundaries, the operation of defining a new boundary is a simple one; you

Robert Rawlinson, Esq., C.B., C.E.

3 May 1869.

can take and define a boundary for health purposes with the assent of the locality out of three or four or more townships or parishes, report to the Secretary of State, and by a Provisional Order or by a gazetted Order you can make it a district within which that community has full municipal powers; that we are constantly doing, and a very valuable power it is.

591. That so far as it exists is upon the invitation of the district, is it not?—It is upon the invitation of the district.

592. Have you formed any opinion as to whether there should be any power outside the group of parishes for the purposes of local health boards?—No, I have not. I have not paid attention to that, and I am not able to answer it.

593. You would be of opinion, I presume, that the conditions of the case would be infinitely various in different parts of the kingdom?—They would. There is a power now for a parish in vestry to adopt the Local Government Act; but if a parish repudiates, then separate districts may be set up; and sometimes when a parish adopts, we are called upon to hold an inquiry in consequence of remonstrances from parties who wish to form a sub-district objecting to the larger area, and wanting to form a smaller area. We make an inquiry, and upon our report it rests with the Secretary of State to confirm the adoption for the entire parish, or to accede to the requisition of the smaller area and dismiss the petition, and allow them to define an area for themselves; but if there were a petition or memorial from several parishes, there is nothing to prevent, so far as I know, the Secretary of State from sanctioning an area as large as a county.

594. Have you formed an opinion, therefore, that there should be upon the invitation of parishes the power to group them into convenient districts for health purposes?—My answer must be general. Upon petition from the districts, yes. But I do not think it desirable, from all my experience, that there should be power to overrule the local wish and opinion of the district, as if opinion is not ripe and ready for a measure necessary for its welfare, I would leave it alone until it ripened up to this.

595. Would not the inevitable result of that be, in many cases, that there would be circumstances in which a small parish would prevent positively useful structural works in a district by refusing to join in them?—I can hardly answer that question without having the details before me. You see the powers to form outlet sewers are now very large, as if one district wishes for an outlet sewer, it can have the power of passing through another district without combining.

596. Then we are to take it as your opinion that the parish authority is, perhaps, the one which you leave as the local health unit?—In the purely agricultural districts, where the population is scattered, in short where you can have no unity of works, I think the parish authority or the parish board, as in Lancashire, might very properly have borrowing powers for sanitary works, and have executive powers for carrying them out.

597. The authority of the conservancy boards and the ordinary health authority of districts would certainly be in conflict rather than otherwise, would they not?—No, not as I have conceived that they might be framed. They must be in accord. As I have sketched it out in my own mind they would necessarily be in accord.

598. Have not, for instance, the River Lee Board, constituted all of the local commissioners, stopped every local authority, and Parliament has followed them in stopping every local authority delivering pollution into the Lee?—No; I am afraid that is not so.

599. Everything except the lower branches of the Lee?—I am afraid that is not so. I wish it were applied to the upper towns of Luton and Hertford; but these towns, which are above the intake of the New River Company and the East London Company, have the privilege, unfortunately, of passing what is called the clarified sewage into the watercourses, although those watercourses supply London with water. I fought against it in the Luton case especially, but the sanction is there in the bill. After that clause was granted it was contended by the river Lee commissioners that West Ham and Tottenham should be absolutely restricted from passing any sewage into the lower part of the Lee until it had passed over the land. That clause I also resisted. I said it was perfectly absurd to restrict those towns at a very great cost from passing the effluent water after clarification into that portion of the Lee, which is now as foul as it well can be, and which practically no engineering can render otherwise than foul after sanctioning Luton as stated.

600. Is not the general scope of that Act to prevent effluent sewage from getting into the river?—I can only say that I wish it were; I am not aware that it is so.

601. Is it not the case that the jurisdiction of the Lee Conservancy Board, and of similar conservancy boards, is in considerable conflict with the action of the riparian health authorities?—Yes, in one sense it is, but when you say other conservancy boards, I do not know what others you allude to. There are only two large conservancy boards that I am acquainted with, the river Thames and the river Lee, and they are both of them very peculiar. They both of them spring out of Acts that were in existence, and bodies that were in existence, and they are neither of them in my opinion such boards as would be established under new jurisdictions over new areas.

602. Those two boards, then, I may take it, are in considerable conflict with the health authorities upon their banks?—They are. They are armed with powers which hitherto have been inefficient. For instance, the Thames commissioners have certain clauses which say that the towns upon their banks shall not after a given day pass sewage as sewage into the waters of the Thames; but all the towns, so far as I know, from Oxford downwards go on doing it. I believe they are under notice, but how the conservators will ultimately bring them to book, I cannot exactly see.

603. The river conservators and those authorities would not make a very happy party?—Not as at present constituted.

604. I think you have been holding lately an inquiry at Kingston. Is it your opinion that such inquiries would be better in the hands of the local conservancy inspector, or in one appointed from a distance by the Secretary of State?—With regard to such inquiries as I am exercising now under our office, I do not see any objection to continuing them. We occasionally, as in that case, have to veto, or rather have to recommend, the vetoing of the petition, but it does no more than this. If the Kingston authorities are aggrieved at the vetoing of their petition by the Secretary of State, it is quite competent for them to apply for parliamentary powers through an ordinary private bill.

605. But would you prefer the jurisdiction of an inspector appointed by the Secretary of State, or one resident in the locality?—I think it is much preferable that the Secretary of State in that case should send down an independent inspector.

606. And with regard to putting the different compulsory clauses of the Act into operation, would you prefer that that power should be with a county board or with the Secretary of State?—I think with the Secretary of State, for this reason, that where a provisional order is necessary for the compulsory taking of lands, the Secretary of State has now all the necessary machinery for the passing of a provisional order, which is to the locality a private Act of Parliament; all the staff is there ready, and therefore I think that a continuance of that power would be desirable.

607. Independently of the mere question of machinery, do you see an advantage or otherwise in that kind of authority being put in motion by the Secretary of State or by the resident local authority?—The authority is not put in motion by the Secretary of

State. He only takes action upon a petition, and I think it is very usefully vested in the Secretary of State, and it may very properly be left with him.

608. With regard to your answer to question 541, is it your opinion that the earth closet is for all public purposes an entire failure?—One form of earth closet, the earth closet with the hopper apparatus, however that hopper may be intended to be worked, is as far as my observation goes a failure, for this reason, if the weather is damp the earth clogs and either sticks in the hopper or comes down in a block. If the earth is very dry it comes down in a fine dusty powder and overshoots the excreta and pervades the place in which the closet stands, and I need not say that to be inhaling dust so impregnated is not very pleasant. In India where the earth closet is used upon a large scale, this apparatus question has resolved itself into what I may term an earth latrine. The moveable box and pull-up handle apparatus has been taken away, and the action of covering the excreta with earth depends, not necessarily upon the individual using the apparatus, but it is an external and extraneous operation.

609. (*Mr. Lambert.*) You spoke of the Act of 1848, when you were examined the other day, and you stated the reason why the old board was broken up. I believe the provisions of the Act of 1848 could be applied in case the mortality of a town or district was beyond a certain number?—That was so.

610. If it exceeded 23 in 1,000, the Secretary of State could send down an inspector and apply the Act if he thought proper?—He could.

611. Do you think that that was a beneficial provision or not?—As far as my experience went it was not, for this reason. I held several of those compulsory inquiries, and the result was that the local authorities shirked the inquiry, and in one particular town that I have in my mind, the town clerk had pressing business to keep him out of the town all the time, and the officials generally had something else to do than to appear before the inspector, and of those who did appear their evidence was of the briefest and vaguest kind, so that the inquiry fell into the hands of the promoters, that is to say, of those who had put the machinery in motion; the local authority received the report with perfect apathy, and they have left it a dead letter ever since.

612. Do you apply that remark to all cases in which those inquiries were held?—I cannot, because I am only speaking of one or two which I have my mind upon, which I know myself. I am not prepared to say that in every case such apathy was manifested towards the law.

613. Are you prepared to state the proportion of cases in which those inquiries were attended with beneficial results, and those in which they were not so?—No, not at all. I am ashamed to say that I am ignorant upon that question.

614. Is it your opinion that in case the mortality should be very excessive in any place it is not desirable that compulsory powers should be exercised, for the purpose of putting the Act into operation?—Not in an executive form, but compulsory in other forms, such as the compulsory inquiry as was held when that fearful outbreak of cholera took place in Newcastle-upon-Tyne, when the Government sent down a commission of inquiry, and a nice state of things they found and reported; but I am not yet aware that Newcastle-upon-Tyne has ever stirred in sanitary matters; it remains just as it was; it has not adopted the Local Government Act; it has not put itself under any general sanitary laws.

615. Take the case of Salisbury, where the mortality amounted to 27 per 1,000, and the inhabitants themselves refused to put the Act into operation, but where an inquiry, such as we have described, was held, do you consider that the circumstances there justified the application and that the application was desirable?—Most unquestionably; but in Salisbury if the inquiry was brought about under that mortality clause, you must have had a sufficient amount of local action and intelligence to accept the Act, and then there must have been sufficient influence to get a willing board elected by the ratepayers, so as to stand in the position of representing the ratepayers, and they were perfectly justified in initiating the works and in carrying them out. That is a case in which all followed in sequence. In the first instance, an inquiry was made against the opinion of the majority, but an intelligent minority takes the matter up and works it to its ultimatum; in those cases, I think, such compulsory powers may be very beneficially left as they are.

616. I gather from you, that if there be an intelligent minority in any place applying for an Act to be put in application, you are of opinion that it is desirable that it should be so done?—Yes; but there are cases where the converse will take place of the result at Salisbury. In another town where the Act was forced upon the community, and the intelligent minority set about the works, devising main sewers and waterworks, they let their contract for waterworks, commenced their engine-house, bought their engines, and bought their mains; but before they could be put into operation the minority was overthrown; the active majority came in and upset everything that was done; they sold the engines and pipes, threw the works into confusion, and have saddled the district with nothing but the debt.

617. Are you of opinion that, in those instances, it would be desirable to have some compulsory power to compel the local board to execute and carry out the works?—No; I think such cases justify me in saying that I should be exceedingly cautious in urging upon any unwilling community compulsory measures. If I may use a sacred simile for profane purposes, I would say, if persons are not willing to receive you, you must shake the dust from your shoes and go somewhere else where they will. My whole life's experience goes to this, that you cannot compel unwilling men under those conditions, and that it is the old proverb verified that one man may take a horse to the water, but many men cannot make him drink. Yo cannot put intelligence into an unwilling community.

618. Under the existing law, the local board is bound to execute certain works and to provide proper sewers for its districts?—Yes.

619. And under the existing law they may be compelled to do so, I presume, by *mandamus*?—I assume so.

620. Do you consider it desirable that that power of *mandamus* should be continued, or not?—I would continue it. I would continue any compulsory power that is to be put in force by the representative body of the locality, that is to say, any compulsory power that the representatives of that district can exercise; and if you can arm the Secretary of State with power to compel that body to exercise its proper authority, those, I say, are the proper compulsory powers to retain.

621. Then to that extent you are in favour of compulsory powers?—Most unquestionably.

622. But you object to those compulsory powers being vested in the Secretary of State with reference to what is in the nature of a byelaw?—I object to making him the devisor and executor of works under the 49th section of the Sanitary Act.

623. But if the local board could be compelled to discharge its duty by some power or other, I presume your objection would not apply?—Not at all. I believe you might then revive very properly the use of compulsory powers.

624. With reference to the Act of 1848, you have stated some objections to it, but was any objection raised to that Act upon the score that certain officers when once appointed were permanent?—Yes. Under the Act of 1848, if the local board appointed a surveyor, the local board could not discharge him without applying to the general board. I find that the Act of 1858 has divested them of that authority.

625. Do you think that that change was desirable or not?—I do. I do not think that any advantage was gained if you attempted to keep an obnoxious officer upon an unwilling board. I held one or two inquiries

Robert Rawlinson, Esq., C.B., C.E.

3 May 1869.

under that clause where the surveyor got at loggerheads with the local board, and where they wished to dismiss him. They appealed to the general board, and as far as my experience went in each case, I recommended the dismissal of the surveyor. It is a very invidious duty; it is a power which a public board had far better be without.

626. Public opinion with reference to sanitary improvements has very much changed since 1848, has it not?—Very much changed in large communities, but I think I could take you into places throughout the length and breadth of the land where it is just as it was.

627. In large communities, thickly populated places, do you suppose there is much objection now to the application of sanitary laws?—I find that in such towns as Liverpool, Manchester, and Birmingham, and in many other large centres, they refrain from adopting the Local Government Act. They choose to work under their own local Acts, and to go and spend large sums of money every session in getting additional local powers which they could get for almost nothing under the Local Government Act.

628. Do not those local Acts substantially contain all the powers that are in the Local Government Act?—They very frequently embody some of those powers.

629. And they are able to do so very easily?—Yes; but still there are special powers in the Local Government Act with regard to street and other improvements, where the locality has only to schedule the amount of property for public improvements, to lodge its petitions and its plans and its notices, just as for a private Act, and then it petitions the Secretary of State, and in due course a local inquiry is made upon the spot, and the proceedings are embodied in a provisional order, and that becomes law to the district in a very simple manner, which is not taken advantage of in many of those large communities and in some small ones also.

630. What in your opinion are generally the obstacles to their adopting the Local Government Act?—If you ask them they say that they object to centralization, that is their general answer; but if you ask them to define what centralization means they cannot tell or they will not tell you; they simply object to be centralized.

631. Do you consider that there is no foundation for those objections?—None whatever.

632. There is no centralization, is there, in the case?—There is no centralization in the sense that they choose to understand it.

633. What is the power that the Secretary of State has now with reference to places under the Local Government Act; has he any other power except that of sanctioning plans and the loan of money?—Yes, he has the power of inquiry. If complaint is made that the local authority is not carrying out the works, then the Secretary of State can send down an inspector and he reports previous to advising upon the very question put to me whether he should issue a mandamus to compel them.

634. Is that the Act of 1866?—Yes.

635. You spoke the other day of the Public Works Manufacturing Districts Act, 1863, the object of that Act was for facilitating the execution of public works in certain manufacturing districts, and for that purpose advances of public money to a limited amount upon the security of local rates, and to shorten the period for the adoption of the Local Government Act; those were the objects, were they not, of that Act?—Yes, they were.

636. With regard to the local authorities concerned in putting that Act into execution, I think that the local authorities already in existence were the persons who put the Act into execution, were they not?—Yes, they were; there were no new creations, except the locality chose to adopt the Local Government Act, and many of them have subsequently adopted the Local Government Act.

637. Was there not power in the Public Works Manufacturing District Act to those places which adopted the Local Government Act to abandon it afterwards?—Yes, there was such a power.

638. Are you aware whether or not any such abandonment ever took place?—I am not aware.

639. Do you believe that there has been?—It has never come to my knowledge.

640. The object of the Act was to give facilities to existing bodies, was it not?—Yes.

641. And not to set up new ones?—Not to set up new ones.

642. With respect to boards of guardians there was a new authority set up, was there not?—I think that it was so modified as to enable them to be an executive board for sanitary works, and for road and other improvements.

643. Was that the case where no other local body existed?—It was.

644. The great bulk of the works were executed by the local authorities, were they not?—Yes, by town councils, boards of commissioners, and local boards.

645. It was only in places where there were no local boards or other local authorities that the boards of guardians adopted the provisions of that Act, and were the authorities?—That was so. There were, however, cases, where parishes included corporations and local boards, but it was outside these boundaries that the parish authorities acted.

646. Have the guardians any power under the Public Works Manufacturing Districts Act to maintain the works so executed by them?—Not being a lawyer I did not trouble myself with acquiring knowledge of the law upon that point.

647. I mean the works which would be in some instances executed by them?—Yes, of course they would, because I suppose the responsibility should be as enduring as the debt incurred.

648. It would be important that they should have the power to maintain them in that case as the local authorities?—Yes, most unquestionably a continuing power.

649. With reference to the Local Government Act of 1858, you stated, did you not, that no reports are now published by your department?—They are not published necessarily; they are in manuscript.

650. Have you a record in the office of the areas of the different districts under the local boards?—Whenever an area is set out—in fact whenever the Act is applied, it is either applied to a known and defined area, or if a new area is set out, then that area is defined, and there must be both a plan and a verbal description of it in the office; and there are such plans and such descriptions.

651. Would there be any difficulty in marking upon the map the areas of the various local boards?—No, I think not.

652. A question was asked you with reference to constituting the vestry the power for sanitary purposes. Do you think it would be less objectionable to adopt the vestry, or do you think it would be more appropriate to adopt the vestry of the parish or the board of guardians for that purpose?—I am afraid I cannot answer the question, for I am not learned enough in the law, and I do not know sufficient of what a vestry is or its powers.

653. A vestry is a parochial body representing a particular parish, do you think it desirable that that body should be confined to the parochial limit, or that it should be extended to the whole union?—That would depend entirely upon what is to be done. I have recently been holding an inquiry at Hatfield, where a vestry had adopted the entire parish of 13,000 acres as the district for sewerage purposes, and there was another party that wished to confine the area to something about 24 acres, immediately round the town. At the inquiry I recommended a modified area, which they have adopted, which is about 1,000 acres, including the town as a centre. Then the vestry becomes the local authority for executing the powers within that area.

654. That is a populous district, is it not?—It is the town of Hatfield.

655. But speaking of ordinary country villages, would you consider it desirable that the guardians or that the vestry should be the local authority?—I would prefer the guardians.

656. Is there not an indisposition on the part of people residing in the same parish to complain against each other?—I cannot answer that question.

657. Will you state why you prefer the guardians?—Because they are an elective body, and they have analogous duties to perform. Inquiry is made in their board room, and they have to discuss and talk over those matters, the question of boards of health, and the question of sewering and water supply of course very nearly concerns the question of the relief of pauperism, because in many instances they might prevent the very disease that they are called upon to relieve as guardians.

658. Are you of opinion that there is a personal knowledge and authority in the case of a board of guardians which does not exist in the vestry, where a place is not under a local board?—I believe so.

659. Do you know whether they have any borrowing power at the present time?—I do not know.

660. Do you think that where they are in circumstances in which a pecuniary aid is desirable they should have borrowing power as in the manufacturing districts?—Yes, I think so.

661. Do you know whether any difficulty has been experienced by boards of guardians in carrying out sanitary works, in consequence of their limited powers?—No, I do not.

662. (*Dr. Acland.*) With reference to your large conservancy boards, I think you gave them limited functions, and as I understood you, only engineering functions. Could you say exactly what duties you would assign to them?—No, I could not in evidence. It would require me to have the facts before me, and to deliberate more quietly, and to look again and again at what I have written, before I could be answerable for defining the duties of conservancy boards.

663. There are several sanitary functions which must be committed to some public body, besides directly engineering works, such, for instance, as registration of disease, superintendence of epidemics and of vaccination, and the appointment, perhaps, of analysts for water, for food, and for other purposes; have you considered to what board or boards you would consign those duties?—To the local government boards where they exist, or to any sanitary boards under any sanitary Acts, and where they do not exist then to the parish authorities.

664. We have already two sets of officers connected with public health placed universally through the country, namely, registrars of births and deaths, and union medical officers; have you given any attention to the registration areas under the registrar general as being useful for administrative sanitary purposes?—Registration areas as they are now set out and used are practically useless, and in many instances mischievous for sanitary purposes as regards towns and local boards, because a registration area is not necessarily either the municipal area or the local board area, but it is some area that is neither one nor the other of those. The registrar general gives returns in his quarterly and in his annual report of outbreaks of disease, which we know arise from bad sanitary regulations, such as typhus, scarlatina, and diphtheria. We will take one or two instances. Say it is Worthing. Now Worthing prides itself upon its sanitary character, having carried out good works for water supply, sewerage and sewage application, but it finds itself tabulated by the registrar general as being liable to diphtheria, to typhoid fever, and to other diseases which imply bad sanitary arrangements, whereas those cases of contagious disease are not in Worthing at all. They are in the Worthing registration area, but not in Worthing town nor near it, but two or three miles away, and where the people of Worthing have no governing power. Then the registration areas mix up the mortality in hospitals, in gaols, and in asylums with that of town districts, and the town mortality becomes complicated with these, so that when you see the brief figures in the return of the registrar general they give you no sort of idea of the health of that special locality. You will have to inquire that for yourself. For instance, if you ask me to give you the mortality for any two sets of years in any towns where I am thoroughly well acquainted with the sanitary works, to see whether my sanitary works or anybody's sanitary works have been effective, those results cannot be got from the published registration returns; you must get them specially, at very great cost, from the local superintendents.

665. I presume that you would wish to have the registration of mortality in some way coincident with your sanitary districts?—Yes, I think it would be very advisable, because there is the machinery upon the spot; there is a defined area, and nothing would be easier than for the local registrar to keep the returns of mortality for the area affected by works which have been carried out, and where you have a defined area and a definite knowledge, so that you could then hope to get at accurate results. At present you cannot tell what the registrar means, excepting special knowledge is obtained at great cost and great trouble. Those returns are now very confusing. I read them sometimes with utter astonishment. I know that they convey to the public an impression that is not the true one. They convey to my mind nothing but confusion. That is no one's fault. I am not blaming any person. It arises out of the circumstance that registration areas have been taken which have now no reference to the special purposes to which we want to put mortality returns for comparative purposes.

666. Can you say whether under the Sanitary Act, or any other Act, there are ready powers enabling the local authorities to obtain land compulsorily for irrigation purposes upon really equitable terms?—I think the Sewage Utilization Acts and the different Sanitary Acts give power to get surveys made, to serve notices, and if you cannot agree you must then ask for permission to put in force the Lands Clauses Consolidation Act of 1845, and so go in the ordinary way to arbitration. The objections are as to the machinery and great costs of arbitration; but all that might be amended if any method could be devised by which the multiplicity of witnesses and the legal expenses could be saved in arbitrating under the Lands Clauses Act?—If you could nominate an assessor, and so restrict the expenditure of money on both sides, I think that might do great good. Sometimes under arbitration the first day's sitting involves as much cost as the whole of the money question in dispute.

667. Then in the case of distributing sewage by irrigation, this difficult machinery exists and costly disputes may occur now?—They may where you have to purchase compulsorily, and where you have to go to the Lands Clauses Consolidation Act, you necessarily bring in that machinery and you are liable then to all this great cost. If any person can see his way to simplifying the matter so as to render the settlement equally as equitable, I can see great room for saving litigation and saving money. Once or twice myself, when I have been holding inquiries and there have been inquiries as to whether the local authorities should put in force the powers of the Lands Clauses Consolidation Act, I have said to them, when I saw my opportunity, you are here on both sides, if you will permit me I will go out with you this afternoon, I will hear both sides, and I will settle this dispute for you, if you will be bound on both sides to take my decision. In one or two instances I settled the entire dispute in that way. It was quite optional on their part, and of course it was gratuitous on my part, but they were very glad to accept the offer to get the disputes settled. If they had gone on under the powers of the Lands Clauses Consolidation Act they must have had their solicitors on both sides, and their witnesses, and the arbitrator must have sat and heard

Robert Rawlinson, Esq., C.B., C.E.

3 May 1869.

the evidence, and then there must have been a decision given by the arbitrators or the umpire.

668. In your large experience in every part of the country do you generally find union medical officers and local engineers satisfactory authorities on sanitary works?—I should be very sorry to answer that question in a way that might be offensive to any persons, but my reply would be this: That as far as my experience goes, I have generally found that they are persons teachable, not necessarily competent but if you show them that you are not antagonistic to them, and are willing to teach them, you generally find that they are quite willing to learn.

669. There are many places now, are there not, such as towns in Lancashire, where the works have been so thoroughly executed that there is not the slightest difficulty in a teachable person seeing what he ought to do in similar cases?—There ought not to be. And then we have drawn up in our office suggestions, a copy of which I will put in before the commission. Those suggestions are upon works of sewerage and water supply. We do not dictate to them, as you will see if you read them; they are simply suggestions, and they are suggestions which have grown out of very wide experience, and if the local surveyors choose to look them over, and then to consult with any of the inspectors in the Local Government Act office, we express our willingness, and we always are willing, to advise them, and we always do as far as lies in our power.

670. (*Sir Thomas Watson*). The union medical officers are in point of fact government medical officers in every parish throughout the country; are those union medical officers, do you know, consulted on sanitary matters as sanitary authorities?—I have had nothing practically to do with unions, or with medical officers, and therefore I am not competent to answer the question.

671. From what you have yourself seen, how do you think the health officers should be appointed, and how should they be qualified? I mean should they be engineers, or police, or medical men, or surveyors, or men of any particular profession, or of no profession?—If by the word "health officer" is meant simply what I should designate an inspector of nuisances, then, for localities containing below 15,000 inhabitants, if there is a county police, some intelligent sergeant of that police would make the best inspector of nuisances; or you might have any other intelligent man appointed to inspect nuisances; but if it involves the duties of an officer of health, that is to say, a medical officer's duties, then necessarily you must have them in duplicate, and you must have a medical officer. I think that all districts of 15,000 or upwards would do very wisely, and might very properly be required, to appoint a local medical officer, whose duty it would be to examine the district; and in the case of an epidemic of any kind showing itself, to report the same as soon as possible, I would have an investigation in every case; and if death from typhus, or fever of that class, were reported, the officer of health or the medical officer should investigate the matter at the place where it occurred, and state in writing what in his opinion caused it, and if he could find a reason, and reported it to the local board, they might be armed with compulsory powers to remedy that mischief; because, if we are rightly informed, typhus fever and typhoid fever should not exist, and do not exist in a well-constituted sanitary district. You have no such thing as typhus fever or typhoid fever in gaols occurring amongst the people that enter and have been there for any length of time.

672. Is there any practical inconvenience that you know of attending what I believe is the present system of sending an engineering inspector from the local government office, and a medical inspector from the Privy Council?—I am not aware that there has been any inconvenience felt. I have myself on one or two occasions made joint inspections. Some of my brother inspectors have made more of them, and they will give you their opinions. We have not come into any collision; there may be advantages in many instances.

673. Do you go together generally and make a joint report?—When a complaint comes up of any great outbreak of fever, and it is considered that it would be advisable to have an inspection, sometimes a medical officer goes first, and if he finds in his opinion that it is connected with works or with a want of works, he then reports to his chief, and the chief requests one of our inspectors, myself or one of my brother inspectors, to go down, either by himself or jointly with the medical officer, and make their report, sometimes jointly, sometimes separately.

674. Do they ever clash?—Not that I am aware of.

675. Do you think that there are cases in which one or the other would be superfluous?—Such cases might arise, but I do not think they have arisen yet.

676. Would you propose to ensure a proper sanitary inspection by the present system through the Home Secretary or through the Privy Council, or by some united or new office, supposing there were new sanitary districts?—I should not like to venture to say what department of the state should take all sanitary questions, but from my river pollution inquiries and from my own studies of sanitary questions I think that we are quite ripe for some consolidation of inspection, but what department it should be under, or whether under a new department, I am not prepared to say; but if you will take such inspection as Poor Law Inspections, Local Government Act Inspections, Alkali Works Inspections, Fisheries Inspections, and the Mining Inspections, sometimes those duties might be made to run concurrently with each other, and if the department was one with one ruling head having power to utilize his force, I think that there might be great economy to the country by condensing and utilizing your inspecting power in some one general government office, but what office it should be I cannot say.

677. Do you think it possible, or if possible, desirable that one person should combine all the qualifications of a first-class sanitary inspector, supposing that engineering and medical questions were referred to him?—I think that you had better separate medical and engineering duties.

678. Are you aware that the general council of medical education is now considering the education of health officers or experts in matters affecting public health, or what is called state medicine?—I have no knowledge beyond the vague fact that your putting the question leads me to believe that something of the kind is taking place, but I have no other knowledge of it.

679. I believe that the Army Sanitary Commission has acted in conjunction with the Council of India in considering the best way of giving information to officers for the purposes of public health. Can you tell the Commission whether their experience would bear at all upon the civil population of this country?—No, it would be very difficult for me to describe the duties of the Sanitary Commissions now acting in India. They transmitted to England the plans for barrack arrangements, for station arrangements and questions affecting, for instance, water supply arrangements. The plans are devised by the local officers, whether civil or military in India, or at any of the other stations, and they are transmitted either to the War Office or to the Indian Board, and then they are transmitted from those bodies to this special Army Sanitary Commission which represents both those bodies. There are two members representing the India Board, and there are two or more representing the War Office, engineering and medical, and then there is Dr. Sutherland and myself, who may be said to represent the civil authority. The reports of the Commission are transmitted back to the several authorities.

680. Could you in detail describe the sanitary works?—There have been minutes of instructions very similar to that Blue Book before you, but upon a more extended scale I think issued to all the stations throughout the world. I dare say that on an applica-

tion from the secretary of this Commission a copy or copies of those instructions would be forwarded. They are with respect to hospital accommodation, barrack accommodation, prison accommodation, and other questions. Then there are printed returns sent in from the different stations in India from the sanitary inspectors, and they are transmitted through the different departments to the Indian Board or to the War Office, and they are sometimes brought before the Army Sanitary Committee.

681. (*Lieut.-Col. Ewart.*) If I understand your views rightly, you would propose to limit the power of conservancy boards to the general control of the rivers, and the preservation of the water from pollution, with preventive powers as to towns, but not supervising powers over the action of the local authorities of such towns in respect to sewage and other like works?—I would do all that you embody in the first part of your question, but I would not limit them to preventive power; they should have power to say to a town, or to any one authority that is made the local board, "You shall not put solids into this river, "you shall not put sewage in as sewage;" and to manufacturers, "You shall not put solids of any kind "in; you shall not put your soap waste and your dye "refuse in just as it comes from your works and from "your vats."

682. Has it come within your observation, that a great deal of bad or useless work has been done by local authorities, from want of sufficient knowledge or proper means of direction or inspection, and that towns have been involved in further debt to remedy the defects arising from such causes?—No, I cannot put my finger upon any such special case. If you could name to me any special case I might perhaps remember something of it. Of course the estimates are overrun in several localities, but as the question is put to me, I do not know any special case that I can bring my mind to bear upon at present.

683. If measures which are proposed by towns are rejected by the central authority, are they left to propose an alternative, or are they given advice or assistance?—They are left to propose an alternative, and they have no advice given excepting they ask for it.

684. If you had a county or other intermediate board between the Secretary of State and the local boards, would you not have a county inspector for works generally, including those for sanitary purposes?—I hardly understand the scope of the question.

685. Would you not have an inspector under that board?—I do not understand whether the county board is to be in the character of a conservancy board or of the local government board.

686. A supervising board over the local board, if you had such a board, whether it be a board of guardians or a county board?—I think it would be very mischievous to establish any such board, or to give any such power to any supervising board of that kind.

687. You would not recommend any intermediate board between the Secretary of State and the local board?—No, not of that kind; not as I understand the question, if I understand it rightly.

688. Do you consider that permission given to borrow money implies any approval of the works to be done?—It implies an approval so far as this—the inspector who has looked over those plans and estimates must have formed an idea that they are not outrageously bad, because if they were he would dismiss the application, but when he has given his sanction or recommended sanction, then I do not conceive how his department is in any degree responsible for the ultimate character of those works. For instance, in the Lancashire public works no local authority could receive sanction to borrow money to carry out the works without my having sanctioned the plans and the estimate; but I expressly stipulated that under no conditions should I be responsible for the utility or character of those works after they were executed. If I found, as the works were proceeding, that they were not being executed with that care and with that intelligence that was necessary to their due usefulness, I could withhold my sanction to the next application for money, and there my authority ceased, and once or twice I did so withhold my sanction, but even then I did not consider myself responsible. And what would follow if I did? Take the case of waterworks. I believe waterworks have been executed in Lancashire under the Public Works Act sufficient to supply nearly a population of a million. I sanctioned the estimates and approved the plans, and then they pass into execution, but I could not be responsible unless I could see from week to week, and month to month, how those works were being executed, and also in case of any unforeseen contingency arising, such as the opening out of a quicksand, or as a slip on the side of the cutting, or the material of which a bank is to be made if it turned out very different to what I anticipated. Now all those things not coming under my own inspection I cannot hold myself responsible, and that is why I would wish to divest any Government authority of executive power, because to be responsible for works of that class you must follow them week by week, and month by month, and follow them with that power of interference that brings responsibility, and you must have power to govern and control the person that is executing the works. That would lead to inextricable confusion, and therefore I repudiate any executive power on behalf of the State.

689. But do you not think that if works are executed upon funds which are borrowed by mortgaging the rates of a place, there should be some means of ascertaining that that money has been properly expended?—Only as far as I state. Supposing we take Oldham. That town has not borrowed money for the supposed purpose, but we will suppose that Oldham had borrowed 20,000*l.* to establish waterworks, and that it makes its reservoir; the security of the entire property of Oldham is given to the Government for the loan of that money. My responsibility ceased as I say when I reported on the plans and recommended or sanctioned the loan, and if that reservoir bursts, it does not diminish the security which the Government holds over the property, the ratepayers are liable to repay the principal and the interest just as if the reservoir endured in place of bursting, I am not responsible. The local surveyor, or the local authority which devised and executed the works, and which borrowed the money, is just as responsible to the Government for the repayment as if they had borrowed it on a common mortgage.

690. You have said that supposing the Secretary of State sent his own engineer to carry out the works, the cost might be trebled or quadrupled, and you apprehend that there may be expenses from 25 to 30 per cent.; can you specify any works so undertaken by Government under which such large expenses have occurred?—I think that it is a fact that the Caledonian Canal very largely exceeded its estimate, and has been so useless as a public work that it does not pay now at this moment for the working and contingent expenses to maintain it. Then take a work which is not very far from the place where we are sitting, the Victoria Street Sewer. That was devised and estimated for by the Metropolitan Board of Works of that day, one of the ablest engineers in England being the engineer, the late Mr. Frank Foster. I believe his estimate for it was 12,000*l.* I think it was let for something between 10,000*l.* and 11,000*l.* That sewer although more or less in ruins, has cost from first to last near 150,000*l.* Just imagine it to have been done compulsorily under an order from the Secretary of State, and by an engineer appointed by him; his engineer would have been liable to all those contingencies, and the Secretary of State would have been liable to all the odium arising from such a failure; the state would have been responsible for all those costs and charges. Some of the buildings at Whitehall have been pulled

down to the foundation and had to be rebuilt, and as I have been informed the sewer is in partial ruins.

691. But that work was done, was it not, by the local authority, and not by the Government engineer?—If it had been done by the best Government engineer that ever existed I am afraid it might have been just as bad; it was done by the Metropolitan Board of Works engineer and their contractor. Nature and accidents will defeat you. In my own experience I have laid out a system of sewers, all goes on swimmingly for a time, but in a street, as narrow as this room, and with valuable warehouse property rising up three or four stories high on both sides the sewer excavation 25 feet deep, all at once the men drop into a vein of quicksand, and if I persist in going through it it is at the peril of pulling down or bringing into ruins the property on both sides, and where you have used the greatest care, and the greatest precaution, cracks either take place or are imputed to the sewers, and actions are set up by the owners against the local board, and if you can imagine the Secretary of State sending an engineer into a town to sewer an unwilling community, you would have actions, complaints, and litigation, there would be no end to it.

692. You spoke of some large excesses upon works done by the Board of Works in Ireland, do you allude to those of an exceptional character which were commenced in 1846 at a time of pressure, or do you allude to more recent works?—I am not prepared to give you chapter and verse. although I have many of the reports in my office, but I alluded in the first instance to the great loss upon the Famine Works as they are called, and I may state to the Commission that it hae come to my knowledge that when the Cabinet sanctioned the public works in Lancashire they believed that there would be similar losses there, The late Lord Palmerston was satisfied that a great deal of useless work would necessarily be done, and that a great portion of the loan advanced to Lancashire would never come back to the Exchequer. As I had the honour of devising and of carrying through the works I am sure my friend, Mr. Lambert, will allow me to speak of him in these terms, as to himself is due the legal knowledge that framed that Act, and the care of Mr. Villers from beginning to end was to divest the Act entirely of centralizing authority and executive power and to leave the responsibility with the local authorities taking full security for the money advanced, and the result has been that there is not one farthing of loss. There is in Ireland a permanent board of works, and the other losses which I have alluded to were losses of this kind—arterial drainage has to be devised. This board of works devises and frames the estimates, executes the works, and the estimates are overrun, and the landowners who consented to a definite mortgage point blank refuse to be responsible for the excesses, and they find means to evade the payment. Those are instances of loss of public money to which I allude.

693. Are you aware that those works were undertaken at a time when it was not possible to prepare surveys or reliable estimates, because time did not admit of it; I allude to the works in Ireland under the Board of Works?—I question whether the same plea could not have been made with regard to Lancashire. I was sent down there at a short notice. I am sure I am speaking to gentlemen who are quite competent to correct me when I say that Parliament was bewildered as to what it was to do; there was to be emigration or there was to be a grant of public money to set those people to work; I was authorized to ask for any engineering or other assistance that I required, but by simply taking the existing machinery, by taking the local authority and explaining to the local boards the proposed operations, and expressing my wishes to render assistance I found the local authorities ready to devise works, and at once to proceed with them. Whether there existed such means in Ireland I cannot say, very probably there was not so complete a local governing authority in Ireland as in England, but I do not know as to that.

694. You do not allude, I presume, to other works carried on by the Board of Works in Ireland, except those carried on in that exceptional way?—Yes, I do. I allude to those works which are being carried on now by the now existing Board of Works in Ireland; there have been great losses upon those works. There is a permanent board of works in Ireland.

695. Can you specify any works?—No, I cannot at this moment, but I have the reports, and I could give the Commission the information if it were necessary.

696. (*Mr. Hibbert.*) With respect to the working of the Public Works Act in Lancashire, will you state to the Commission how, in the case of a parish, the initiation of the works commenced; did it come from the parish itself, or from the board of guardians?—From the board of guardians. When I was sent down into Lancashire I was associated with Mr. Farnal on behalf of the Poor Law Board, and we from day to day for the first three months attended by appointment upon all the local authorities and talked these matters over with them. In the meantime the Act was being amended; and we explained the provisions of the Act, and in all cases they (the local authorities) took the initiative. If works were to be done they themselves devised the works, they asked for a loan, but they carried the works out.

697. How were the guardians supposed to know the wants of a particular parish. Was the attention of the guardians called to the wants of a particular parish, as to the drainage or any other work upon which the money was wanted to be expended?—I suppose the guardians themselves being resident in the district, and coming from several districts, would meet in the board-room and would say "Such and such a work can "be improved, and such and such a work can be done," and discuss it amongst themselves.

698. Then it was not done at the vestries? Did the vestries meet and call upon the guardians to carry out certain works?—I think not, not necessarily. I think that the guardians took the initiative.

699. In carrying out those public works in Lancashire, is it not a fact that the Government inspection of those works during the whole time has been carried on without any expense at all to the local authorities?—None whatever; there was no inspection other than by myself and one assistant that I had resident in Manchester during the time, one office clerk, and Mr. R. A. Arnold. When local authorities made application for a further instalment, the district was visited, the works in progress were inspected, the accounts were audited, and a short report was made, which was submitted to the Poor Law Board, and if it was satisfactory the further instalment asked for was granted; but there was no inspection beyond that, excepting that if a difficulty arose, and a letter was sent to me or to Mr. Arnold, one or other of us went down to the district and examined the difficulty, whether sewerage or waterworks. I there and then advised the local engineer or the local authorities upon the spot, such inspections costing them nothing.

700. Were the plans of the works proposed to be carried out laid before some public board in London?—They were transmitted through the Poor Law Board to me.

701. Is there any difference between the mode which was adopted in carrying out the public works in Lancashire and the other works which are carried out under the Local Government Acts?—No, it was exactly analogous; and it was my experience under the Public Health Act and under the Local Government Act that enabled me to give that ready attention to the sanitary works that were proposed in Lancashire.

702. You stated that there is a strong feeling against centralization with respect to the Local Government Act; is not that feeling much less strong now than it was before the Public Works Act was brought into operation in Lancashire?—I believe it is. Throughout the length and breadth of Lancashire the feeling was

so strong, that for the first week or two I almost despaired. I attended with Mr. Farnell at Stockport, and there, to use a very familiar phrase, we had the cold shoulder. We attended at Oldham, and had a wag of the head there, and were told that the town council would do no such thing as undertake works. We were in other places met with remonstrances, and asked whether we were not ashamed of ourselves to ask them to do works which would burden the rates in a time of distress, and it was only by conciliatory conversations and persuasions that we got the local authorities started, and then principally by referring them to places that had been some time under the operation of the Local Government Act, as Preston, Wigan, and after the favourable replies from these and some other places we induced them to proceed.

703. Their objections arose, did they not, more from prejudice than from anything else?—Prejudice, and if I may use so strong a term, ignorance; they did not know what they were objecting to. They had been told in fact of this centralization that if they once adopted this Act the Government would be what I am pleading with you not to let it be, namely, that it would become a devising and executive power overriding local authority.

704. From the mode in which the various works have been carried out where the guardians were the authority, you would probably say that the guardians might be made the authority for carrying out in rural districts sewage and other sanitary works?—Yes, I do. Parishes are as general as the area of the country and the board of guardians is an elected body, and there are magistrates at times members, in districts purely rural I think that you could give guardians power to borrow money upon properly devised works, and carry those works out, as the guardians did in Lancashire.

705. I understand you to say that you object to the compulsory powers possessed by the Secretary of State under the Sanitary Act?—Only so far as compelling him to send an engineer to devise and execute the works. I stop there.

706. You do not object to his having an over-riding power, but you object to his being made the executive power to carry out the works?—That is all, my objection does not go beyond that.

707. Supposing the law were altered and the Secretary of State were enabled to inquire and, if necessary, to make an order that certain works shall be carried out, would you say that you would put the execution of those works under the guardians of the district?—Yes, and if you could frame a clause giving the Secretary of State power to fine the district if there is an epidemic and they will not carry out works, or if you can show that the water of the district is so poisonous as to produce fever, then devise some measure by which you can compel local authorities into action, anything short of making the Secretary of State the executive; I do not object to all forms of compulsory power, as I think that it might be in some cases wisely exercised.

708. Have you given your attention to the mode in which the law now stands with respect to the authorities in country districts, that is to say, in districts which are not under the Local Government Acts?—If the honourable member means the authorities set up under the new Sanitary Acts—the Sanitary and Sewage Utilization Acts—I must answer, No; because those Acts were passed during the time that my attention was abstracted by Lancashire public works and River Pollution Commission work, and I have not had occasion to take them up. The other inspectors will tell you much better than I can as to the authorities and as to the working under those Acts.

709. Is there not an objection to making a large body like the vestry the authority to execute any sanitary work in a parish?—No, I think it is very much better to set up an elective body which shall be defined, which shall be returnable for re-election upon the ratepayers, as under the Local Government Act, with provision that the elective power shall not go into abeyance. Then you have representation and taxation going simultaneously together.

710. Do you think it would be possible to make a parish government body in every parish just as you do now in parishes or places which adopt the Local Government Act?—Yes, I think you might. As I have stated a parish now may adopt the Local Government Act over the entire parish, if there is no local authority in force in the district. It becomes a question then whether it is always advisable to allow a parish so to monopolise the area in which there will be say one or two centres of population that might want to take separate action, and to do their own works in it, because the question is as to whether you should permit the parish to exercise authority over that entire area or whether you should permit the smaller sections to establish a new area.

711. I am speaking of small parishes—parishes with only 300 or 400 of population; of course those parishes do not require all the powers which are given by the Local Government Act. Could not you have some legislation which should embody certain of the powers of the Local Government Act, and make them compulsory upon every parish in the kingdom, that is to say, every parish which is not under the Local Government Act?—There again the word compulsory I do not quite comprehend. As to a small parish of 300 or 400 persons, I think I may say that if you would enable them legally to take the executive powers in the Local Government Act, and use them as a local board would use them, it might be a great advantage.

712. Are there not many powers in the Local Government Act which it would be unnecessary to give to a small parish, and yet there are powers in the Local Government Act which it is very desirable they should have and which should be put in operation in such parishes?—I am not lawyer enough to know whether it necessarily follows that if you let them adopt the Local Government Act all the powers of that Act are necessarily to be used. I think it lies with them to use such powers as they find requisite for their own district, and it might be an advantage to enable them to adopt the Local Government Act and use the powers fitting for their special purpose.

713. Could not an Act of Parliament be drawn which should embody certain powers of the Local Government Act, and be made compulsory upon every parish?—I am not sure that some of the Sanitary Acts do not exactly do that, but as I said my brother inspectors will better explain those powers to you than I can do.

714. I suppose you know that the Sewerage Acts give power to the vestries to carry out certain sewerage works?—Yes.

715. Are you aware that, although they have power to carry out sewers, they have no powers over the roads, those powers being vested in the surveyors of highways?—I can quite conceive that, but as I say again I am not up in the Sanitary Acts.

716 Do you not think it would be better to consolidate those powers and give them to a board to be elected in each township or parish, and that that would be much more likely to lead to sanitary works being carried out, than leaving the power as it is under the present law?—I do, because any parish or other local authority that has power to make sewers should have jurisdiction over the roads within its own area; the one follows the other—the maintenance of the roads and the construction of the sewer and drains should go together.

717. I understood you to say that in your report on the pollution of rivers you recommended that in order to prevent the pollution of rivers, the sewage for instance should not be turned into the rivers, and no sewage matter should be turned in from a manufacturing establishment, what would you propose to do to get rid of the sewerage matters and the solid matters?—My ideas with regard to river pollutions go to this—that you should, in the first instance, prohibit the casting in of solids from any source either from towns or from manufactories, and that you should prohibit the

Robert Rawlinson, Esq., C.B., C.E.

3 May 1869.

passing in of any unclarified refuse, dye waters, soap waters, or chemical ingredients of any kind which are notoriously liable to render the water so impure as to spoil it for other manufacturing purposes. Then carrying the prohibition that far I would say nothing further about it, but leave the remedy in the hands of the persons so tied up. For instance, I would not say absolutely to every town in Lancashire or every town in Yorkshire you shall irrigate, but I would say positively to all, you shall not send sewage into the river in its present condition; you shall take out all the solids, you shall clarify the water by the best chemical means, by the use of perchloride of iron or any other chemical agents that you choose to use, and you shall bring it to a certain standard of clarification, before it goes in—leaving them ultimately to adopt the simpler and the cheaper and the better method of land irrigation.

718. Then you do not propose, as I understand you, to carry the sewage water and other impurities away to some distant place?—No; that would entirely depend upon local conditions. Both in Lancashire and in Yorkshire steam-engine boilers use sewage tainted water, and if all such water were diverted many large works must stop. Dirty water is now necessary. This dirty water must not therefore be abstracted, but must be clarified.

719. Would not that be doing a very serious detriment to the manufacturers of the district?—I speak after considerable inquiry and after a considerable amount of thought upon the subject, and I have not yet seen a manufactory as to which you could not make the requirement reasonable. For instance, take the manufacturers of Yorkshire which pollute rivers to a far larger extent than the manufacturers of Lancashire do; the woollen and worsted trades are far dirtier trades than the cotton trade. There is one form of pollution very injurious to the streams, and that is turning in the soap waste. Wool cannot be manufactured excepting by the aid of a very large quantity of soap and oil, and the waste water is about the most offensive thing that you can turn into a river. At this moment there is something like 100,000*l.* returned back to the manufacturers who choose to adopt the process of recovering the grease from this soap waste, but there is at least double that amount that is lost and turned into the rivers, because the other manufacturers do not choose to carry the process as far as it can be carried, and many do not choose to adopt the process at all. There really can be no harm in enforcing upon every manufacturer the clarification of his water, and the recovery of waste material of that kind. Then in tin-plate making there is one of the most injurious compounds passed into the rivers from the pickling or washing of the tin plates, in which sulphureous acid is used, combined with other things. You may carry on tin-plate making from beginning to end profitably and beneficially and never send one single gallon of that matter into any stream or river, because if you put it where it can crystallize, a sort of green copperas, as I think they term it, is formed; at all events, there is a crystal formed which, I believe, is valuable for manufacturing purposes. That may go on continuously, and I would advocate prohibitory powers to stop people from poisoning rivers by turning in those ingredients. Then, with regard to the making of gas, rivers are polluted occasionally now by gas refuse, and formerly they were pollutted most abominably by it; but we know that you can make gas in perpetuity and never pass one gallon of fluid refuse into a stream, or pollute it with a single pound of solid.

720. (*Lord Robert Montagu.*) Is not turning gas refuse into rivers prohibited by the Gas Companies Act of 1851?—Yes; but many of them commit breaches of the Act, because there is no superintending authority. Then with regard to the alkali works, any person who will go into the districts where alkali is made upon a large scale, as St. Helen's or Newcastle-upon-Tyne, or any district where there are large alkali works, will see enormous mounds of refuse poured out in which there are ingredients left from the manufacture of alkali. Every shower of rain that comes upon it dilutes it and dissolves it, and washes it down, and if it goes into any stream it makes that stream in such a condition that it burns up all classes of vegetation and in the case of the canal near St. Helen's it attacks all the limestone upon the canal and destroys it, and it destroys or burns the iron that it comes in contact with, and if any unfortunate person fell into the water and went once overhead, he would be taken out a dead body. That trade I am informed by chemists can be carried on, and the material that is now left to corrupt the air and to pollute the soil and the water may be reconverted and the fouling ingredients may be taken out of it and it may be rendered innocuous and even be a paying operation to the manufacturer, but the margin of profit is so small that persons will not be troubled with looking after it, unless compelled by a law which is general in its application and enforcement in the trade.

721. (*Mr. Hibbert.*) Then we may state broadly that irrespective of the system of clarifying the sewage or any other matter, you think that the law may prohibit pollution?—I do. With regard to the obstruction of streams at this moment in mining districts, without let or hindrance coal mines, iron mines, and quarries exist on the banks of streams and a tip head is made into the nearest valley that may have a stream in it. In South Wales, up in the centre of the iron region, I saw the scoriæ coming out from huge furnaces and the water of their streams was not metaphorically boiling, but literally and absolutely boiling, on the margin of the stream there were great red hot slags rolling down into it. Then, on some of the most beautiful Lancashire streams there are very large iron works—they do not tip the scoriæ absolutely and actually into the stream, but they ingeniously run a tip parallel to it and it slopes down to the edge of the stream, and then the very first flood that comes rises 10 or 15 feet up the bank, and takes thousands of tons away and brings the tip down and so they go on, and that refuse is deposited in the lower reaches of the stream to the destruction of the stream, and to the great injury of the riparian owners whose lands are flooded by the raising of the bed of the stream.

722. (*Earl of Ducie.*) Do you contemplate the future use of earth-closets on the earth system either according to the present mode that is employed or under some improvement?—I think that there may be an adaptation, but I would take away the word closet and I would take away the word dry, because neither of them is applicable to the system, and call it an earth latrine, for you cannot use the word dry when the urine has to go into it, and you cannot use the word closet when the apparatus breaks down in the closet machinery, but you may in country districts have latrines in which earth is scattered ever the excreta and removed at short intervals which would be an enormous improvement over the putrid cesspit which ferments and gives out noxious gases.

723. You do not think that that is at all likely to supplant what we may call the liquid system?—Not when you necessarily have sewers and drains.

The witness withdrew.

Joseph Clegg, Esq., M.R.C.S.

(4.) Joseph Clegg, Esq., M.R.C.S., examined.

724. (*Chairman.*) You are one of the district medical officers at Epping, are you not?—I am medical officer of that union and also of several parishes in the neighbourhood.

725. What is the size of the union to which you are medical officer?—There are 17 parishes in the union.

726. What is the local authority at Epping?—At present we are under the Sanitary Act of 1866.

727. When you talk of we do you mean the whole union of 17 parishes?—No; I mean the town of Epping.

728. Is that one of the 17 parishes?—That is one of the 17 parishes.

729. Are the others all rural?—Yes.

730. What is the population of Epping?—The parish of Epping is about 2,100, that is to say, the town of Epping itself; but we have had a special drainage district recently formed by the Home Secretary containing portions of the parish of Epping, Theydon-Garnon, and Theydon-Bois, the population of the district being about 3,000.

731. What is the local authority for other purposes of local government?—Until the passing of the Sanitary Acts of 1866 and 1868, there was a nuisance committee which sat at the union house, and they had, I believe, two inspectors for the removal of nuisances appointed for the whole union, but after the passing of the Act the clerk to the nuisance committee advised them that they had no further powers, consequently we have no authority for the removal of nuisances in the whole union at present.

732. Has Epping any special Act for any Local Government purposes?—We have no special Act; a special drainage district was gazetted on the 30th of January 1868.

733. Is the board of guardians the local authority for all sanitary purposes?—No, they have no power whatever over the district.

734. What is the local authority for such purposes?—We have none whatever.

735. You must have somebody responsible by law?—No, the Home Secretary is now about to commence the works, the engineer has surveyed the district, and is making his plans in order that he may commence the works.

736. Have you yourself as a resident medical gentleman finding the bad state of the district called for inquiry?—The first step I adopted was in February 1867. I endeavoured to get the magistrates to act and see what could be done. I addressed several communications to the board of guardians, but they told me that really the Nuisance Removal Act gave them so little power that they could do nothing. In consequence of the difficulty which I had in procuring anything to be done, I decided upon getting a parish meeting called for the purpose of putting the Sanitary Act of 1866 in force, and on the 25th of April 1867 a meeting was called for that purpose, and at that meeting it was decided to adjourn to the 28th of May in order to form a special district, for that purpose as far as Epping was concerned, and that the parishioners of Theydon-Garnon should be requested to do the same in order to form a joint district as neither parish could be drained without the assistance of the other. In the meantime the meeting in Theydon-Garnon was held when they determined not to adopt the Sanitary Acts, but simply to enforce the Nuisance Removal Act. In consequence of this determination I addressed a letter to Mr. Simon, of the Privy Council, desiring him to send someone down to inspect the neighbourhood, as it was then in a very unhealthy and dangerous state, there being a great many cases of fever. The parishioners of Epping held their meeting on the 28th of May at the Cock inn, when they decided to appoint a committee to carry out section 10 only of the Sanitary Act of 1866.

737. Is section 10 of the Act of 1866 as theto drainage of houses?—Yes, it is. They appointed a committee to carry out that section, limiting the action of the committee to making certain alterations of a most trivial character. In consequence of the evident determination of the parishioners to do nothing effectual, I addressed a letter dated June 7th to the Home Secretary, desiring him to put in force the 49th section of the Sanitary Act, 1866.

738. The 49th section of the Act of 1866 enables the Secretary of State in case of default by the local authority to have works done by his own authority?—Yes.

739. On the 25th of June I received a notification that he had appointed Mr. Arnold Taylor to visit Epping for the purpose of inquiry and to report on the sanitary state of that district. The inquiry was held on the 11th and 18th of July, and on September the 19th Mr. Arnold Taylor's report was sent to the Home Secretary, who forwarded to me a copy of it, which I had printed for circulation in the neighbourhood, a copy of which I will hand in to the Commissioners (*handing in the same*). It also contains the analyses of the well-waters of Epping, by Professor Way. Mr. Taylor in his report states that, "If ever "the town of Epping is to come under any efficient "system of local government and to have the proper "means applied for its sanitary improvement, there "must be first formed a district of the town of Epping "made up of portions of the two parishes of Epping "and Theydon-Garnon." Consequently a memorial was prepared and signed by one-fourth of the ratepayers within the proposed district, comprising parts of the three parishes of Epping, Theydon-Garnon, and Theydon-Bois. The petition was presented to the Home Secretary on the 17th of October, and on the 29th of October he gave notice that Mr. Arnold Taylor would hold an inquiry on the 12th of November at Epping under the Sewage Utilization Act, 1867, section 8.

740. Section 8 of the Act of 1867 gives power, does it not, to an undefined inhabited place to apply to be constituted a special drainage district?—Yes, for the settlement of the boundaries of a special drainage district, as set forth and described in the memorial. The result of the inquiry was that a special drainage district was formed and gazetted on the 13th of January 1868. On the 30th of March I addressed a letter to the Home Secretary with reference to the question as to the mode of calling a meeting for election of the committee of the Epping town special drainage district, and the appointment of a summoning officer. The reply of the Home Secretary was that he had no power under the Acts to appoint a summoning officer, but he recommended that the churchwardens of the three parishes included should sign a joint notice of a meeting for the election of a committee and the necessary officers. As considerable doubt existed in the minds of many persons as to the legality of that manner of proceeding, I took counsel's opinion upon the subject, who advised that the notice should be signed by the incumbents of each parish in the district as well as by the churchwardens, and by at least as many laymen as would raise the number of signatures to 20. A notice was given, bearing date the 30th of April 1868, signed as above directed, of a meeting to be held on the 7th of May, for the purpose of electing a committee and officers, &c., to carry out the Sanitary Act of 1866. The meeting was held on May the 7th, and the committee was elected, comprising 21 persons, with full powers to carry out the Sanitary Acts, the ratepayers having delegated to them the power to elect an officer. After this committee had met weekly for three months, I made a formal application to see their resolutions, but was refused; I considered that I had a right to see them as a ratepayer in the district, and I made a formal application to do so. I ascertained from members of the committee that they had determined to do little or nothing, as they had negatived a motion to appoint an engineer for the purpose of carrying out the necessary works for drainage and water supply, but subsequently at another meeting they resolved to call in Mr. Stevenson, a civil engineer, to give a report as to how water could be obtained for some smaller portions only of the district, leaving the town of Epping entirely out of the question both as regards drainage and water supply. This state of things being most unsatisfactory, I addressed a letter to the Home Secretary, dated the 1st of August 1868, begging him at once to put in force the 49th section of the Sanitary Act, 1866. After many letters passing between the committee and the Home Secretary, the committee on the 5th of November called a meeting of the ratepayers to explain their position, which resulted in their tendering their

J. Clegg, Esq., M.R.C.S.

3 May 1869.

Clegg, Esq., M.R.C.S.
May 1869.

resignation, and its being accepted, so that since the 5th of November we have had no committee, nor any inspector of nuisances, nor any sanitary officer at all in the whole district.

741. So that in fact the whole story amounts to this, that the authority having been constituted, did not act, and as soon as the Secretary of State attempted under the 49th section of the Act of 1866 to compel them to act, they resigned as a body and eluded him?—Yes. In consequence of the decision of that meeting, I addressed the Home Secretary again on November the 6th, begging him to appoint some person to carry out the necessary sanitary works in this district. On the 8th of December notices were posted calling a meeting of the ratepayers of the district for the 17th of December, for the purpose of receiving and considering an order from the Home Secretary, bearing date November 21st, on the sewer authority to carry out the works requisite for the proper water supply &c., of the said district within one month, and for the purpose of taking such steps as may be deemed expedient. At this meeting a proposition that a clerk to the sewer authority be now appointed, was rejected by 43 against 12 votes, on which a poll was demanded, and when the poll was taken, the majority was very much larger. Afterwards a motion was carried by 54 against 16 that the meeting be adjourned to the 5th day of May next, that is the day after to-morrow. On the 21st of December I addressed another communication to the Home Secretary praying him to appoint a person to carry out the necessary works, and an officer to levy and collect rates, &c., in the district. After waiting six weeks for a reply I addressed another letter to the Home Secretary, dated January the 30th, which resulted in his appointing Jabez Church, Esq., civil engineer, to carry out the works of drainage and water supply in the Epping district, which appointment bears date the 13th of February 1869, and Mr. Church is now busily engaged in making a survey and preparing plans and specifications, &c. for the said works.

742. Then, in fact, the works will be carried out?—Yes, they will be carried out, but at present there is no officer of any kind in the district.

743. Will you state generally, as a person of medical authority, what is the sanitary condition of Epping?—It is very bad indeed. The mortality is larger than in any district in the whole of Essex; in 1867 it amounted to 26·5 per 1,000.

744. Was that without any epidemic to account for it?—We had a great deal of typhoid fever. I have got the correspondence which has passed between the Secretary of State and ourselves, in which the state of the neighbourhood is fully set forth.

745. Generally speaking, you think that that arises from the want of drainage and the want of a good water supply?—It does.

746. Will the works which you are now about to effect cure that?—I have no doubt whatever that they will.

747. How will the Secretary of State recover the cost of the works?—He has the power of appointing a person to receive monies and to collect.

748. So that in fact the law is effective after a long delay, and after great obstruction on the part of the locality?—It is done at last, but it is a great trouble, and it has all had to fall upon my own shoulders, and I do not think that that is a state of things which ought to exist.

749. As you have gone through so long a battle, would you suggest that the law might in the first place have the effect of obliging the action of the locality?—I consider that the matter ought to be made compulsory; the Act ought to be put in force at once, but it is not so now.

750. What sort of legal power would you propose to make it compulsory?—I would levy a penalty upon the district; that is the only way, they care for nothing but money.

751. Do you mean that you would make the adoption of the Local Government Act compulsory?—Yes, I would make it compulsory; if the Act is right they ought to be compelled to put it in force.

752. To what extent do you think the adoption of the Act should be made compulsory?—I should put it in force in every parish in the kingdom.

753. For what purposes? — For the purpose of drainage, and for water supply also.

754. You are not contemplating any other functions of local government, such as with reference to the overcrowding of dwellings, or any other matter of that sort?—That is a very important matter. I think that the present organization existing in unions would be the best to adopt, for a sanitary committee to have the power to act where there are no local authorities; that is to say, where the Sanitary Act is not carried out in any special drainage district, or under any Local Government Act. The whole of the parishes ought in such a case to be under the control of the union.

755. Do you think the board of guardians would more effectually carry out such an Act than the vestries?—Yes, a special committee formed by the board of guardians. The vestries would not act. There is a case in point now in the adjoining parish. You will perceive that a portion of Theydon-Bois is included in the Epping district. There was an attempt to get rid of those nuisances in Theydon-Bois, and they have elected a committee, and I believe the committee have virtually determined to do nothing, and it will end there.

756. Would you propose that a work which only applies to one parish should be placed under the guardians of the union?—I think it would be better.

757. Generally speaking you think that the vestries will not work?—Not at all.

758. What sort of a surveyor or inspector do you think the board of guardians ought to have for the purpose of sanitary superintendence; should he be an engineer or a medical man?—As a rule medical inspection perhaps is the best, but surveyors might be found who are not medical men quite competent to deal with nuisances. The only fault is that a nuisance is not sufficiently defined in the Act.

759. You have an inspector of nuisances, have you not, at Epping?—No, we have not. They will not appoint one.

760. Have you any such an officer for suggestions to make as to special drainage districts?—The difficulty of electing officers to serve in such a district is very much felt in our own case.

761. What does that difficulty arise from?—Unwillingness to appoint anyone. They think that by appointing no officer nothing will be done.

762. Do you think that they could appoint officers who would act independently without fear of their employer?—Yes, certainly. There would be no difficulty if they were disposed to appoint one.

763. Who should those officers be appointed by—the vestry or the board of guardians?—By the vestries where the Sanitary Act is in force in a special district, but where it is in force in different parishes in a union, by the board of guardians.

764. Supposing it were for two or three out of your 17 parishes, would you have the appointment made by the parishes or by the guardians?—By the guardians. In our instance there is a portion of Epping which is out of the special drainage district, and nothing is done there; there is no one to do anything in it.

765. By your own activity you got an inspector from the Local Government Act Office in London, but do you think that there ought to be some more regular inspection without application?—Certainly. I think that there ought to be inspectors taking similar districts to those of inspectors under the Poor Law Board. We all know that the poor law would never be carried out if there were no poor law inspectors, and there ought to be an inspector to take a similar district, and to report his own opinion as to its sanitary condition.

766. Do you think that this inspector should come from London?—Certainly he should, just the same as the poor law inspectors are appointed now throughout the country; let them be resident in certain districts in

England. I think that the poor law inspectors have two or three counties generally under their supervision.

767. Do you mean that they should make an annual report to the Local Government Office?—Yes, or more frequently if required.

768. Have you any suggestion to make as to the plans of works or buildings or dwelling houses being under inspection or approval?—I think that no buildings of any kind ought to be erected without the approval of some authority.

769. What circumstances have led you to form that opinion?—You very often find in the country that a man gets a very small piece of land, and he puts a house upon it, without any privy, or without any drainage, or any water supply, or any proper footpath to it, and some of the very worst characters in the neighbourhood will inhabit those houses, and thus the parish becomes saddled with very bad people; and then by-and-by typhoid fever or cholera, if there happens to be an epidemic of cholera near, breaks out, and the suffering is very great, and the people become permanent paupers.

770. Do you mean that every local authority should have a surveyor whose approval should be necessary to every plan of a building?—Yes, certainly. I had intended to have brought a plan with me on which I could have shown a number of houses that have none of the conveniences that I have mentioned, as many as 14 in a row, and some have had their privies put over a ditch where the soil accumulates in a most offensive manner.

771. Do you think that such a plan of inspection and approval could be carried out in country villages?—Yes, certainly; by appointing a surveyor for the whole union.

772. Do you think that it should be made imperative that every building should have good drainage and good water supply?—Yes, certainly.

773. How many inspectors of nuisances do you think would be necessary effectually to carry out the Nuisances Removal Acts in your union?—The best arrangement would be to appoint the police officers in the different districts; they are the most effective inspectors of nuisances as a rule in small districts.

774. Are you talking now of rural villages?—Yes.

775. Is it the county force which acts at Epping?—Yes.

776. Do you think they are persons who could be relied upon to prevent nuisances?—They could be relied upon more than any other persons, I think; but there is very great difficulty in getting a nuisance removed when it is brought before the magistrates. There is a case in point now in the parish of Epping. Before Mr. Amys resigned his function as clerk to the nuisance authority, and before the executive committee for the union was dissolved, a dispute arose as to who should empty a cesspool. The occupier said that he would not empty it as it was not his province. Then Mr. Amys served a summons upon the agent for the property. The agent denied his liability to do anything of the kind, and then I believe a summons was served upon the owner, and there has been a great deal of litigation going on in that case.

777. How would you propose to make it more clear as to who is the person who is to be made responsible for nuisances?—The law ought to be defined as to who is responsible for a certain kind of nuisance—for instance, if it is connected with the construction of the work the owner is clearly at fault—if it is for accumulation and the means at one's hand for removing the accumulation, it is evident that the occupier is at fault.

778. You think that the law should specify clearly what kind of nuisances owners or occupiers are liable for?—Yes, certainly.

779. Have you any suggestions with regard to making the special drainage district coincide with the registration districts?—I felt it desirable as we were about to carry out the works we should know something of the mortality that has preceded the carrying out of those works; and also for a number of quarters afterwards, it is very desirable that that should be known, and I called at the Registrar General's Office to know if that could be done, and I took a plan with me of the district, and stated that as one portion of this district belonged to another sub-district, not at Epping, which is five miles from the Registrar, it was desirable that we should have it put in the district, so that we could have then the whole of it under one Registrar, and have special registration for that district; but I was told that they had no power; that they felt the great inconvenience of it, but they could not alter it, that the district was originally formed by the guardians. The law does not allow them to alter any registration district. It is very important that greater power should be granted to alter those districts.

780. Have you any suggestion to make as to fever hospitals?—From seeing so many cases of fever brought into my own neighbourhood, and more especially small-pox, and seeing how it has spread, I thought it desirable that we should have a fever hospital of our own, to receive cases of small-pox, scarlatina, and measles, situated somewhere near the centre of the union, in order that all cases of fever or any of the diseases that I have mentioned, if removed from their own residence, should be taken there, the law being made compulsory that such patients should go to no other place but the place provided by the parochial authority if they were removed at all.

781. Do you mean a fever hospital for every union?—Yes; but I would not make it a pauper establishment.

782. You have a suggestion to make, have you not, as to the use of waste lands in certain neighbourhoods?—Yes. In the neighbourhood of Epping we have about 300 acres of waste land, which is now only a curse to the place as a refuge for the prostitutes and thieves in the neighbourhood. I suppose we have no less than 50 or 60 of these characters in that neighbourhood now, who could not possibly live there if it was inclosed. The whole of this land is undrained, and is a very great nuisance to the whole neighbourhood. If the land were enclosed we could make a park and a cemetery, both of which are very much wanted, and leave sufficient land to carry out our drainage works if it was disposed of.

783. What sort of power do you want to facilitate this?—At present Her Majesty has refused to grant any more crown grants for any portion of Epping Forest. I believe that if Her Majesty would give permission to inclose this the lady of the manor might be compensated by giving her a portion, and the copyholders would be compensated by having that work carried out free of expense.

784. (*Earl of Romney.*) I understand you to say that you believe that the board of guardians have no power to appoint inspectors?—They consider that they have not; they were so advised by their late clerk.

785. Did you ever know an instance of their having done so?—They had an inspector before the passing of the Act of 1868.

786. Do you believe that in consequence of that Act that power which they formerly had has been taken away?—That was the reason which they assigned.

787. Have you any belief to the contrary; do you think that they have been wrongly advised?—I think so; I think that they have the power.

788. (*Lord Robert Montagu.*) Do you consider it absolutely necessary that every sanitary law should be compulsory just as vaccination is by law compulsory?—Certainly.

789. And on the same ground?—Yes, on the same ground.

790. Do you think that competent inspectors should be appointed for sanitary matters, just as it is now obligatory under the Cattle Plague Acts to appoint inspectors of cattle?—I should take a larger area perhaps than the area of the cattle plague inspector.

, Clegg, Esq., M.R.C.S.

3 May 1869.

791. If it is necessary to appoint inspectors for cattle, and if the law makes it compulsory, is it not still more necessary and therefore should it not still more be compulsory that inspectors should be appointed for sanitary matters affecting human beings?—Yes, certainly.

792. Unless those two conditions are fulfilled, the sanitary laws will not be observed, you think?—They will not be effectually observed.

793. Why is it that the guardians refuse to carry out the sanitary laws; is it from ignorance or from what reason do you imagine?—I do not think that as a rule, the guardians refuse, except in certain localities, for instance, in small villages or in a small town like Epping. The guardians as a rule remove nuisances far better than the vestry.

794. Is it from ignorance, do you think, that the vestry refuse to carry them out?—I think it is a good deal through ignorance, but quite as much from the cost.

795. Do you think that persons who are elected directly by the ratepayers are not so apt to carry them out as persons who are elected by a double election, such as the Metropolitan Board, or a committee of the guardians or of the vestry?—The great misfortune is that there is so much petty jealousy in a small place—one person will not do a thing just because another proposes it, and that is generally the case in a place like Epping. In a large area like a union you have the whole board of guardians elected from different places and they have not those prejudices, and they are changed annually, at least many of them are.

796. Then it is chiefly from local prejudice you think?—I think so, a great deal of it.

797. (*Mr. Cave.*) You think that in the wider area public opinion prevails as contradistinguished from private local opinion?—It is so, I think.

798. Was not it in one of those parishes, Theydon, that the outbreak of cholera took place?—Yes, the parish I alluded to is Theydon-Bois.

799. It was introduced there from Southampton, was it not?—Yes.

800. In such a case as that the present law seems entirely useless in enforcing any rapid action?—You cannot put this Act in force quickly, unless the people are willing to do it. If they are quite willing, you have a very easy remedy.

801. When you propose to inflict a penalty on a district, will you state a little more distinctly what your opinion is upon that point?—If the surveyor or inspector finds after he has reported to the board that certain nuisances are required to be removed, that the authorities do not remove those nuisances, he would report to the board accordingly, and the board would report to the Government inspector of the whole district, and then, perhaps, he would make an application to them to do it at once, and if not, he would take steps to compel it to be done, just as the inspector of factories, if he finds that persons are evading the law, takes them before the magistrates and proves the facts, and a fine is inflicted at once, so I should inflict a fine upon a parish to be paid out of the rates of the parish.

802. Supposing the board did not report to the Government inspector?—The surveyor's report would be recorded in the books, and when the Government inspector came down he would see it, and the board would be under a penalty for not having done so.

803. Who would bring him down to inspect the boards?—He would take a circuit.

804. That is supposing the law were altered in the way you propose?—It is supposing that.

805. Not according to the present state of things?—No.

806. You would propose that the fine should be levied upon the district; who would have the power of levying that fine?—The inspector. I would give him the power to do so.

807. Have you considered to whom the fine should be paid?—I would let it go to the expenses of the inspector, and it should be paid to the Government.

808. You think that a better plan than the Home Secretary directing the execution of the works?—I think so; a local board would never hesitate were the Government to adopt the same course as has been adopted with regard to the River Lee Conservancy, by whom a certain notice is given that if the works are not completed within the time specified there is a penalty of 100*l.* and 50*l.* per day afterwards; under the River Lee Conservancy Act I believe that is so.

809. At present the works are going on at Epping, are they not, by order of the Secretary of State?—The survey is being made, and the plans are being prepared, but the works are not yet commenced.

810. (*Mr. Powell.*) The poor law union is composed of a group of parishes, and the board of guardians is the result of parochial election of parties representing the different parishes, who meet and form a board. I presume that your evidence would not at all oppose a proposition to form other groups of parishes for sanitary purposes, and for them to elect a representative body which might be called a sanitary board?—Not at all. We have got one group in Epping now of portions of parishes, arranged for convenience.

811. You think that such groups, taking parishes as the unit, but having regard to the sanitary wants of localities, might be found to furnish an efficient machinery?—I do not understand whether the question implies that where there are not those groups of parishes the board of guardians would act as the sanitary authority.

812. No, I am assuming the whole country cut up into groups of parishes for sanitary purposes?—I think it would be far better to use the same machinery that you have now.

813. You would retain the Union as it now is, and re-distribute the parishes into new groups for sanitary purposes?—Certainly, except where the population is likely to be 3,000 or 4,000, or perhaps more than that, where they would like to manage their own affairs themselves.

814. You think that people are so much accustomed to poor law unions that you would allow them to maintain the custom?—I think so.

815. In your remark in favour of enclosing Epping Forest, did you refer to the whole forest?—Only to the portion within the parish of Epping, and which is beyond the metropolitan police district entirely.

816. (*Mr. Richards.*) From your experience of boards of guardians is it your opinion that a sanitary board could be formed out of a board of guardians somewhat in the same manner as the present board appoints a board for valuation purposes?—The board of guardians at Epping had lately, at least until the Act passed in 1868, a nuisance removal committee elected out of the different members of the board that acted in a similar manner.

817. But do you think it would be possible to make it imperative upon boards of guardians to form a sanitary board?—Certainly.

818. Do you think that that body would be likely to be an efficient sanitary board, assuming that a certain number of *ex-officio* guardians were appointed upon it?—They would be more efficient than the committee, for instance, elected in Epping, in the drainage district.

819. Why do you think that that would be so?—Because in a small district like that, there is so much local petty jealousy that they will not carry out the things that are really best for the town; they would do it very readily if they knew that unless they did do so they would be under very heavy penalties.

820. (*Mr. Bircham.*) Would you think it convenient that the jurisdiction of the roads should be in the same body as the jurisdiction in respect of health?—It would be much more convenient than the present formation of highway districts without any regard to the unions at all.

821. And that the board you are alluding to should comprise the duties of a district board of roads and health and nuisances?—Yes.

822. (*Mr. Paget.*) I presume that you have knowledge enough of the sources of mortality in Epping to enable you to say that the great mortality that you speak of is due to causes which sanitary laws might control?—Yes, certainly.

823. There has been no special collection of old persons more than ordinary in Epping which should add largely to the amount of mortality?—There are a great number of old persons, but the great mortality is due chiefly to typhoid fevers and fevers of a low type. Of diphtheria we have had several cases, and in my practice I attended in two years about 170 cases of typhoid fever.

824. You spoke of the necessity of fever hospitals. You think that the condition of Epping is such that it would be impossible to prevent the spread of typhus fevers in good private houses?—I think there is great danger of its spreading. It might be prevented in good houses, but my object is to prevent any of those fevers by removal. For instance, a servant is taken with the smallpox or scarlatina, and she is sent home to her father or mother, whichever it may be; where perhaps there are seven or eight children in the house. There has been a case, for instance, of a girl with smallpox sent to North Weald, where several families had the smallpox, and from North Weald it spread to Duck Lane, a distance of about a mile, and from Duck Lane to Epping.

825. (*Dr. Acland.*) I understand you to wish the country to be divided into general districts for sanitary purposes, either unions or some other division I presume?—I think that the union is the most convenient, because there is already the machinery at work.

826. But not necessarily a union?—Not necessarily so; but I think it is the best because the machinery is there.

827. Would your principle be that of having local administration and Government inspection?—That is what I should advise; Government inspection certainly.

828. As is the case now with unions?—The Government inspector, I think, simply reports as to how the law is carried out with reference to the administration of the poor law; he has nothing to do with sanitary laws.

829. Should you say from your experience of the unions generally in your neighbourhood that the guardians are indisposed to carry out the sanitary regulations recommended by their officer?—I do not at all think that the guardians are indisposed to carry them out. It was not by the wish of the guardians that the nuisance committee was broken up. It was simply by the advice of their legal adviser, who told them that they had no power.

830. Then it was the fault of the law, and not the fault of the locality?—I do not think that it was the fault of the law. I believe they are trying to organize it again. Their legal adviser said they had no power to act under that Act of 1868, because he said that under that Act the whole power of electing an officer was taken away from the board.

831. (*Sir T. Watson.*) Do you think a constable of the county police would be sufficiently independent of the board of guardians or the inhabitants of the place generally, to be trustworthy to report nuisances?—I think he would. I have seen constables very efficient in many places in pointing out nuisances.

832. Would you recommend him rather than any other person?—Yes; he is more independent. There is one thing about the Nuisance Removal Act which I think ought to be altered. At present you require a notice to be signed by two householders before you can act. I think that ought to be done away with. The inspector ought to act upon his own account, and not only that, but any one person should be able to make a formal complaint before him, and he should go and inspect the nuisance, and if the nuisance exists he should cause it to be removed without bringing forward the name of the party who has made the complaint, because it is not desirable that the name should always be known. I know many instances where persons are living in a very friendly manner and wish to continue to live in that way. Perhaps there is a heap of blood and manure within 10 or 12 yards of a person's chamber window, and he knows how very wrong it is, but he says, "I dare not complain of my "neighbour. I cannot get it removed unless I get "two householders to sign it." The result is that it goes on in that way without any remedy, whereas simply signing a notice to an inspector, and the inspector being bound to secrecy and not to divulge any name, it would be remedied.

833. (*Lieut.-Col. Ewart.*) You would propose, if I understand you rightly, that the medical officer of a union should in fact be the sanitary inspector of the union, the police occupying the subordinate position of inspectors of nuisances?—I think it would be better to have a sanitary committee, as was suggested by one of the commissioners, composed of members of the board of guardians with a number of *ex-officio* guardians to form a sanitary committee, and let them appoint their own clerk, and let the inspector of nuisances report to them. They would then record everything; the Government inspector would see that record, and see whether they had carried out the Act in its entirety, and if not, he would be able to inflict a penalty on the district.

834. With regard to the superior inspector that you have spoken of for a county or a group of counties, would you propose that he should be solely an inspector for sanitary purposes?—Yes, certainly; he should inspect the union workhouses and see that the Acts were carried out in all the different unions and in every district in the union.

835. (*Mr. Hibbert.*) Have the poor rates been raised in your neighbourhood owing to the great mortality?—I do not know that they have been raised; I think they are much about the same, I cannot say what they are this year.

836. With respect to your proposal about making the guardians a nuisance removal committee, did you mean that you would have a committee of guardians, something similar to the assessment committee of a board of guardians?—Yes.

837. Would you allow the *ex-officio* guardians, representing each township or parish, to be on the committee?—It would be better that they should be constituted on the same plan as the union valuation committee.

838. You would prefer that to having a board elected purposely for sanitary matters?—I think so. It is not very material, but I think that would be the best course.

839. What was the reason why your district has refused to carry out the necessary works?—One great reason is the expense, and another reason is the petty jealousy of parties in the neighbourhood.

840. Do you think you would get over those difficulties by referring these matters to the board of of guardians?—I think we should in our district, if it was simply known that there would be a penalty of 100*l.* if the works were not carried out at a certain date and 50*l.* a day afterwards.

841. Would not it be as difficult for the board of guardians to carry out works in a district, as it is for the Secretary of State to carry them out?—Our place is becoming much larger, and ultimately the work may be all done, and it is desirable where you can have the local action of a number of inhabitants together to let them manage their own affairs as far as they can; but where I wish to see the board of guardians acting is in rural parishes, more particularly small parishes.

842. Do you think that the board of guardians would do without the overriding power of the Secretary of State?—I think that his inspectors would be quite sufficient.

843. (*Earl of Ducie.*) I presume there is nothing exceptional in the case of Epping to account for this apathy and obstruction on the part of the authorities?—I know no reason except the expense and the feeling of petty jealousy.

844. And to that we might attribute the delay

J. Clegg, Esq., M.R.C.S.

3 May 1869.

which takes place in a great many other places?—I think that it is more marked this year with us.

845. (*Chairman.*) Do you think after those works have been carried out by this roundabout process that the locality will come to an agreement to constitute a local authority?—I think they will shortly, when they find that it will cost much more if the Government have to go on collecting the money for them, than if they collect it for themselves. That is the only way of bringing them to their senses.

846. Will the expenses of the works now going to be carried out be levied upon the rates of those three particular parishes which are there combined?—Not upon the parishes, but upon a district formed out of the parishes; it will be a special rate.

847. Are not the boundaries of that district conterminous with the boundaries of the parishes?—No.

848. (*Earl of Romney.*) What is your opinion with regard to the employment of relieving officers as inspectors?—I do not think they are so effective as the inspectors of police.

849. Would not they have great facilities for doing the work by having to go round and give outdoor relief?—Yes, they have great facilities for doing it, no doubt.

850. Those things will necessarily very often come under their observation?—Yes, frequently; but there is this to be said against it; there are many localities which the relieving officers do not visit at all, where nuisances may be existing; whereas in very poor neighbourhoods persons do not object to speak to the policeman, and say, "If you go into my back yard "and look over the wall you will see a nuisance "there; will you report it?"

851. But the police, unless they have some particular reason for it, do not go into houses and into the back premises of those houses; whereas the relieving officer's duty in certain cases is to do that?—That is only in the case of the very poorest, and it is often the case that nuisances are worse with the middle class than with the very poorest; for instance, butchers and those kind of trades.

852. If the relieving officer were appointed he would have the same facilities that the policeman would have with respect to the middle class, and increased facilities with respect to the poorest and probably the filthiest class?—Yes.

853. With regard to the very worst classes, where the greatest nuisances would exist, he would go with peculiar facilities because he would go there in the discharge of his duty as relieving officer?—Yes; but that would often take him away from his duties as relieving officer. It was tried in our union to make the relieving officer an inspector of nuisances, but I do not think that it worked so well as if they appointed the superintendent of police as an inspector, because he makes use of all his men.

The witness withdrew.

A. Taylor, Esq.

(5.) Arnold Taylor, Esq., examined.

854. (*Chairman.*) Are you one of the inspectors of the Local Government Act Office?—I am.

855. How long have you been so?—Since June 1865.

856. Have you prepared certain abstracts of inquiries, conducted by yourself in your present office, which you wish to put in as evidence?—I have; of inquiries under the Local Government Act since that date, and under the Sanitary and Sewage Acts since September 1866.

857. Do those abstracts give a general idea of the questions on which inquiries are held by the inspectors of your office?—They do, except inquiries relating to sanctions to loans, of which I have taken no notice in the abstracts.

(*The same were delivered in, and are as follows:*)

Abstract of Inquiries under the Local Government Act, from June 1865 to December 31st 1868.

——	1865. ½ year.	1866.	1867.	1868.
Settlement of boundaries of districts	6	7	4	3
Special circumstances—places under 3,000 population.	2	2	2	—
Division of districts into wards -	1	1	—	—
On appeals against adoption of Act	4	5	3	1
„ for separation from new districts.	1	2	1	—

Powers for compulsory purchase -	—	4	8	7
Altering number of local board members.	—	—	—	1
	18	37	32	25

Abstract of Inquiries under the Sanitary and Sewage Acts, from September 1866 to 31st December 1868.

——	1866.	1867.	1868
Complaint of default by local or nuisance authority under sect. 49, Sanitary Act, 1866.	7	12	17
Modification of boundaries of districts, sect. 6, Sanitary Act, 1866.	1	4	1
Formation of special drainage districts, sect. 7, Sewage Utilization Act, 1867.	—	4	—
Settling boundaries of district, sect. 8, Sewage Utilization Act, 1867.	—	1	—
	8	21	18

858. Would you state generally the nature of your different kinds of inquiries? The first I think is that of the settlement of the boundaries of districts?—Yes, this is the first in the abstract of inquiries under the Local Government Act. I have grouped them, and I will take them in order. The first is with regard to the settlement of the boundaries of districts, under the 16th section of the Act of 1858.

859. That is the section providing for the settlement of boundaries upon the adoption of the Act by any place?—Yes, in places not having known or defined boundaries.

860. The next kind of inquiry that you conduct is as to the special circumstances of places under 3,000 population?—Yes; those inquiries are held under the Local Government Amendment Act, 1863, section 2.

861. What was the object of that particular section?—When the General Highway Act was passed in, I think, 1862, a great number of small places adopted the Local Government Act, to escape the operation of the General Highway Act; and scores of places did this, particularly in Yorkshire, and in the north of England generally, not intending to do anything under the Local Government Act; and in order to counteract this movement, the Amendment Act of 1863 did not permit any place with a population of less than 3,000 to have the Local Government Act, unless it could show special circumstances for its adoption.

862. The next kind of inquiry which you conducted is as to the division of districts into wards?—Yes.

863. Under what Act is that?—That is under the Act of 1858, section 24; a district may be divided into wards by the sanction of the Secretary of State. I have only held two inquiries, as I see by my abstract.

864. The next kind of inquiry that you conduct is where there is an appeal against the adoption of the Act?—Yes, on appeals against the adoption of the Act, or for separation from newly formed districts.

865. You do not seem, by the abstract which you have put in, to have had many such appeals to inquire into since the first two years?—No, they are rather less in my list, but my brother inspector, Mr. Morgan, as well as Mr. Rawlinson, may have held appeal inquiries; those are the only inquiries which I myself have held.

866. May we gather from your abstract that appeals against adoption are not as frequent as they used to be?—It would seem not, from my list, but that may be accidental.

867. I observe in your abstract that you have made one inquiry on the subject of the sewage outfall beyond the district; under what Act was that inspection?—Under the Local Government Amendment Act, 1861, sections 6 and 7.

868. Was that a case in which the party interested objected to having his land passed through?—Yes, it was the case of a landowner who objected to the position of the proposed outfall works, and with very good reason, I think in that case.

869. I observe that you have made some inquiries relative to appeals against the building byelaws, under what Act are those inquiries made?—Section 34 of the Act of 1858 is the power under which the local boards make byelaws. The Secretary of State must give his approval to those byelaws, and before giving his approval he may make what inquiries he thinks proper to satisfy himself of their fitness.

870. Have you any observation to make as to appeals against auditors' surcharges?—There, again, there have been some important results. At present the accounts of every local board are annually examined and passed by the district auditor, and if he finds any items in those accounts, which are, in his opinion, contrary to law, he surcharges the persons who may have signed the cheques making such payments. The poor law auditor is also the district auditor for the purposes of the Local Government Act. The persons surcharged, if they think they are unreasonably charged, can appeal to the Secretary of State, and he can take an equitable view of all the circumstances, and either remit or enforce the surcharge. That is an alternative rather than taking the case to the Queen's Bench, where it would be heard purely upon points of law. In two instances I have held inquiries into the circumstances under which those surcharges were made, and it seems to me with so great advantage that, at a further point of my evidence, I will speak of the necessity of bringing the district auditor and the central authority into closer connexion in all cases.

871. Will you proceed to mention the inquiries under provisional orders, and first as to the extension of borrowing powers?—That is with regard to giving the local board where it has either constructed, or is likely to construct works, exceeding one year's rateable value, the power of borrowing up to two years' rateable value, and paying off the amount of the loan in 50 years instead of 30, which would be the case where the borrowing power is only exercised up to one year's rateable value.

872. That power of extending the borrowing powers by the Secretary of State is under the Act of 1858, is it not?—Yes; the Act of 1858 limited it to a particular class of works, and the Act of 1861 extends that power to any works.

873. With regard to the partial repeal or alteration of local Acts, under what Act is that power given?—These provisional order cases come under the 77th section of the Act of 1858.

874. As to separation from, or inclusion in any district, under what Act is that?—That is under the same section, the 77th of the Act of 1858.

875. Under what Act is the power for compulsory purchase?—That is under the 75th section of the Act of 1858.

876. And also as to altering the number of local board members, under what Act is that?—The Act of 1858.

877. Before we proceed to your inquiries under the Sanitary and Sewage Acts, what do you think are the general effects of those local inquiries upon the localities where they are conducted?—I think they are very useful in removing or softening down local prejudices, and in removing misconception of the working of all the Sanitary Acts.

878. Do you hold your inquiries in open court?—Always, and after public notice. The provision of the Local Government Act is that all the inquiries under its provisions shall be held upon public notice and after so many days' notice in the district, and we make a rule absolutely in all cases to hold it in public court, where all may attend and hear what is going on, and what is being said.

879. Does your abstract show that the provisional order system is on the increase?—It does.

880. Do you think that the system might be extended?—I think considerably.

881. In what way?—I would give facilities by means of a provisional order to provide, not universally, but where necessary, for the union of districts for the purposes of water supply and for the purposes of sewage outfall and sewage disposal, for highway maintenance, and to give local boards the same powers outside of their district to acquire lands and properties for the purposes of water supply as they have now outside their districts for sewage outfall and disposal.

882. Do you think there is any difficulty in the present local government system as to the powers for continuous inspection and supervision of districts?—I think there is.

883. Over works in process of execution?—Not so much over works in execution, as over the administration of the Local Government Act by local boards, and over the general sanitary condition of their districts.

884. What is the system of inspection which you mean to suggest by that answer?—Permanent inspectors, having a special knowledge of the work, making from time to time inspections of the kind which I refer to.

885. Have you made any estimate of the number of inspectors which would be necessary for such purpose?—No, I have not.

886. What would be the class of men that you would think fit for such a function of inspection?—I would not define any particular class. I think an engineer could easily pick up enough law on the subject to do the work, and I think a good lawyer, or any lawyer, might soon pick up enough engineering knowledge to do the work that I contemplate under the system of inspection.

887. Would you not be obliged to have some person with medical knowledge also?—As to medical men, where pure questions of health are concerned, I have not included those in my answer.

888. Is it your notion that there should be a few superior men of the description you have mentioned with a number of sub-inspectors for the more ordinary work?—No; I do not contemplate any system of sub-inspectors.

889. But an inspector to do the work that you propose must be a man of rather a superior education, must he not?—Yes. I would propose something of the same class of men that we have at present as inspectors under the Poor Law Board.

890. What is your opinion as to Local Boards intending to apply for Parliamentary powers being required first to submit their proposed bills to the Home Secretary for his approval?—I am assuming Parliamentary powers to be exercised by the local board.

Taylor, Esq., 5 May 1869.

I confine it to that. I think they should be required to submit their bills to the Home Secretary first.

891. Is there any case which has particularly led you to that opinion?—Yes, the case of Wallasey, opposite Liverpool, on the borders of the Mersey. The Wallasey Board has become a large trading company, not only for purposes of gas and water supply, which are all more or less analogous to the functions of a local board, but they have been providing steam ferries and landing stages, and they work those ferries, or did, when I was there a year and a half ago, at an annual loss of something like 7,000*l.* They applied to Parliament and got the clause inserted that I allude to in an Act dated the 15th of July 1867, entitled "An Act for making further "provision with respect to the ferries of the Wallasey "Local Board, and to empower them to extend their "gasworks, and to raise further monies, and for other "purposes." And by section 36 of that Act they are enabled to charge "The deficiency (if any) from time to "time in the Wallasey waterworks account, the Walla- "sey lighting account, and the Wallasey ferries account "respectively referred to in the Act of 1858, whether "under that Act or the Acts of 1861 and 1864, or "either of them, or this Act, shall be borne and paid "by the local board out of the general district rate, "and the amount of the general district rates, and of "the estimates of the money required for the pur- "poses of the general district rates shall respectively "include all monies required for payment of any such "deficiency, and also of any monies from time to time "due or accruing due for principal interest, or sink- "ing fund in respect of mortgages under the recited "Acts, and this Act or any of them charged on the "general district rate as a collateral security, and for "the payment of which the other securities (if any) "comprised in such mortgages respectively shall be "insufficient." Under that clause they have taken powers to charge the Wallasey district, one portion of it with a general district rate of 4*s.* 6*d.* and another of 4*s.* 10*d.*, and the fact, I may say, came accidentally to light from my having been there upon an inquiry relating to the surcharges that had been made upon certain members of the local board by the auditor.

892. And you think that there should be a general submission of such bills for the approval of the Home Secretary to check such powers being taken?—I think so.

The witness withdrew.

Adjourned to Thursday next at 2 o'clock.

Thursday, 6th May 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.	SAMUEL WHITBREAD, Esq., M.P.
The EARL of DUCIE.	JOHN TOMLINSON HIBBERT, Esq., M.P.
The Right Hon. LORD ROBERT MONTAGU, M.P.	EVAN MATTHEW RICHARDS, Esq., M.P.
The Right Hon. STEPHEN CAVE, M.P.	FRANCIS SHARP POWELL, Esq.
Sir THOMAS WATSON, Bart., M.D., F.R.S.	BENJAMIN SHAW, Esq.
Lieut.-Colonel EWART, R.E.	JAMES PAGET, Esq., F.R.S.
JOHN ROBINSON McCLEAN, Esq., M.P.	FRANCIS THOMAS BIRCHAM, Esq.

E. Norris, Esq., 6 May 1869.

(6.) JAMES EDWARD NORRIS, Esq., examined.

893. (*Chairman.*) You are a solicitor and town clerk of Halifax, are you not?—Yes.

894. And also clerk to the local board of health of that borough?—Yes.

895. What is the nature of that local board?—The corporation of Halifax acting by the council are the local board of health under the provisions of the Public Health Acts, and they are also the local authority for carrying out the provisions of the Nuisance Removal Acts.

896. Have those Acts been productive of good to Halifax?—Undoubtedly.

897. Have you a knowledge of their operation in other towns?—Generally in Yorkshire, and more especially with regard to the operation of the Acts in our own immediate district. I happened to have been clerk to two or three local boards before I was appointed to the office of town clerk of Halifax, and I and my partner are clerks to two other local board districts, Elland and Hipperholme, so that we are familiar with the working of the Acts. I was also formerly clerk to the Midgley and Warley local boards.

898. Your opinion being generally favourable to the operation of those Acts, does your experience enable you to suggest any amendments?—I think it would be desirable that the provisions of the Public Health Acts, taking also into consideration the provisions of the Towns Improvement Clauses Acts should be codified so as to make them applicable to large towns and populous districts and not to enable the ratepayers in agricultural districts to adopt the provisions of the Public Health Act simply and purely. In Yorkshire there is a strong feeling among the inhabitants of townships where they have power to lay their own poor rates and highway rates, to have self local government, and they have a very great aversion to be united with other townships, so as to form, as it were, a district of townships or a highway board; and for the purpose of avoiding being clubbed together and forming a highway board, they call meetings and adopt the Public Health Act, but really and practically they never put the Acts into force at all.

899. They have the power of putting into operation the Public Health Acts?—Yes, but they merely treat the Act as a dead letter. They have adopted the machinery of the Act so far as the election of the board is concerned, and they carry it out merely for highway purposes.

900. Has Halifax a local Act?—We have a special local Act, but we have also the Public Health Acts, in operation. The first Improvement Act for Halifax was in 1768, which is a very voluminous Act. That was repealed in 1823 and that Improvement Act was subsequently reviewed by order of the General Board of Health which was then in existence. In 1851 at the time when the Public Health Acts were adopted by the borough certain portions of the Act of 1823 were repealed and other portions were made applicable to the extended area of the district of Halifax.

901. What are the powers which you have under your special Act, as distinguished from those which you have under the public Acts?—I find upon examining the provisions of the Public Health Act and the Towns Improvement Clauses Act there are a great many similar provisions which have been enacted in the General Acts, so that there is a clashing in the working of the General Act with our Local Act.

902. Supposing your special Act was altogether repealed, what would be the difficulty of merging all your powers under the Public Acts?—Possibly as far as the Towns Improvement Clauses were con-

cerned it would make very little difference, but the Local Acts we obtained are compound Acts, and they very often contained provisions for water and for gas and lighting as well, which should be retained.

903. So that there are still some powers under the local Acts which you would not have under the public Act?—Certainly, and which we wish to keep alive; then the courts have held that the provisional orders which are made under the Public Health Acts can only incorporate Acts of Parliament which are not inconsistent with the provisions of the Public Health Act, so that in point of ,act many of those provisional orders which have been made are, as regards the Acts that they have incorporated bad, so far as the provisions are concerned of those Acts that are incorporated.

904. Under such a codification of the Public Health Acts which you have suggested, could your special Acts be merged altogether?—I think it would be more desirable that a general codified Act should pass for towns improvements, and then that there should be inquiries held in the towns to see whether portions of the local Acts could not be done away with, and other portions retained applicable to the special requirements of the town.

905. Do you not think that in a complete codification the local Acts that you are cognizant of in Yorkshire might be gradually done away with altogether?—I think, speaking broadly, that might be the case and a very desirable thing to be done.

906. Is the codification that you contemplate something the same relating to towns, as the Towns Improvement Clauses Act, 1847?—Yes, I think the Towns Improvement Clauses Act and the Public Health Acts together might be carefully analysed and codified so as to have a complete set of provisions applicable to all towns, and also a set of provisions, as far as the removal of nuisances are concerned, applicable to rural districts.

907. But the Towns Improvement Clauses and the other Consolidation Acts of that period were intended to be read with the special Acts, whereas, if I understand you the codification, if perfect, would do away with all the special Acts?—Yes, I think so. There are certain provisions of the Public Health Act which have been found to work very inconveniently indeed in our large towns in Yorkshire. For instance, power is given to the local board to make byelaws for the construction of new buildings and the formation of streets and the drainage of them. There are a great many of those regulations which have now become, absolutely necessary for every town to adopt, but inasmuch as they are byelaws and not enactments, every objection possible is raised by parties who do not wish to expend money or to conform to the regulations of the authorities, and they take us to the Court of Queen's Bench at considerable expense for the purpose of endeavouring to upset our byelaws on the ground of their being repugnant to the laws of the land, or unreasonable according to the idea of the parties who object, and we find the magistrates very often fall into the same view. They think the byelaw unreasonable, you have to come to Parliament and get an Act of Parliament passed with every clause in it that is desirable for the requirements of the town, a clause can be enforced, but a byelaw cannot. Last year I had a great number of those very byelaws embodied in a local Act of Halifax, which are now the law of the land. I submitted them to Mr. Taylor at the Local Government Act Office, and he was kind enough to give evidence on that occasion and to say he thought they were very desirable to be introduced into our Acts. They are now law, and we find them work exceedingly well; we have no trouble with the owners of property in enforcing them.

908. Are we to understand that your idea of the codification of the law would be to take the Towns Improvement Clauses Act, 1847, as the basis, and to include the Public Health and Sanitary and Nuisances Acts in it?—Such provisions of the Public Health Act as may have been found by practice and experience desirable to be codified and form one enactment.

909. All those remarks of yours simply refer to boroughs and towns; they are exclusive of rural districts, are they not?—Quite so. I think it is a mere farce applying the Public Health Act to rural districts.

910. What line would you draw between towns and rural districts?—I think the population line would be the best line. I should say from 10,000 to 12,000 inhabitants should be the lowest number to which the Act should be applied.

911. What would be the nature of the district Act which you would suggest for rural districts?—Something of the nature of a Nuisance Removal Act.

912. Do you think that that would be sufficient?—Yes. I think that the towns clauses are quite inapplicable to rural districts.

913. Would not some provisions for drainage and for sewage purposes be necessary?—I think that they would come necessarily under the head of removal of nuisances.

914. What would you say with regard to the water supply for instance?—We find that in the large towns in Yorkshire waterworks are made by those towns under the provisions of the Waterworks Acts and the local Acts which embrace an exceedingly large area of supply. For instance, the town of Halifax covers about 4,000 acres, but we have a limit for water supply which embraces not very far from 30,000 acres, a very large proportion of the parish, and in that area we have something like 12 local board districts under the Public Health Act. We supply many of them in bulk with water, and therefore, inasmuch as we are the sole purveyors of water within that area the towns or villages under the provisions of the Public Health Act, taking water from us in bulk would only require a power for the distribution of water for domestic and sanitary purposes within those areas, and the rural districts would only take water from us when they really required it, which they could claim under the provisions of the Waterworks Clauses Act—so that the Acts applicable to rural districts need not, I think, include any provisions with respect to water supply.

915. Except compelling them to make use of such opportunities as you have been alluding to?—Yes; for the purpose of nuisances removal.

916. With regard to towns having local improvements Acts, is it your proposal that they should obtain provisional orders for the purpose of assimilating their local Acts to the General Towns Improvement and Nuisances Removal Act?—Unless there are provisions in the general Act which would virtually repeal the provisions of the local Acts, of course I think it would be necessary that there should be inquiries in the large towns to ascertain how far those provisions ought to be repealed or to be retained in addition to the provisions of the general Act. The most convenient way is certainly by a provisional order; it is very inexpensive and it is an inquiry on the spot, which gives everybody an opportunity of being heard, and those inquiries are always held with great impartiality, and I think that they are generally approved of in the large towns.

917. Will you state how the Sanitary Acts have operated in Halifax?—I think that they are very complicated. The provisions of the Public Health Act and of the Nuisances Removal Act are in many clauses somewhat similar, but different in machinery for carrying them out. If those Acts could be analyzed and one simple Act passed for the purposes of the removal of nuisances, it would be much better than having so many to follow and examine.

918. Are the authorities under the different Acts different bodies in Halifax?—No, but of course the Poor Law Guardians have certain powers under the Nuisances Removal Acts, and also the local board has similar powers, and at times they clash.

919. Can you give us an instance of their clashing?—During the time when England was threatened

with cholera, I think the beginning of last year, or 1865, we certainly found at times that we had been inspecting premises which had also been inspected by the guardians; and unless we acted in concert or there were some means or other of ascertaining what each was doing, the two bodies would have been travelling over the same ground. It is much better that there should be one authority than two.

920. Whom do the corporation employ as inspector of nuisances?—We have a paid inspector, whose duty it is to examine the districts and to report to the committee appointed by the local board, then we take proceedings under the Nuisances Removal Acts or the Public Health Acts, whichever may be required, and enforce them through our inspector; but I am of opinion that all large towns ought to have a paid medical officer. I think that it would be very desirable indeed.

921. Is there a double inspection of nuisances in Halifax on the part of the corporation and on the part of the board of guardians?—No; I think you generally find that the inspector appointed by the board of guardians keeps pretty clear of the inspector of the local board.

922. With regard to the medical officer that you suggest, whose officer would he be, and what would his duty be?—I think that he should have the management of the statistics of mortality and the registration, and that he should be officially called in when required for the purpose of giving evidence in enforcing the provisions of the Nuisance Removal and the Public Health Acts. We find that medical men generally do not like to give evidence unless they hold some official position, because they very often come in conflict with their own patients and they are anxious to avoid being called before the justices. So that I think a paid medical officer would be a very desirable addition to the staff of officers appointed under any local authority for the removal of nuisances. The inspectors very often take little complaints and they are magnified and cause quarrels and bickerings in districts; but an educated man like a medical officer would go to a place at once and report to the central committee whether he thought it was a case that required immediate attention or not.

923. Supposing the Consolidated Act commenced by grouping under great heads all the different powers which were necessary for local government and for nuisance removal, and then proceeded to state what authority in each place, whether town, borough, or rural district, should possess all such powers as the locality required, would that be the sort of simplification which you think would be desirable, and if so one in which all the local Acts might merge?—I think so.

924. Have some towns to your knowledge been at the expense and trouble of codifying their Acts?—They have; Oldham is one case. Stockton-on-Tees this year is in Parliament for the same object, and in point of fact, local Acts now are becoming almost as voluminous as the old Acts were in consequence of the experience which towns have acquired. In carrying out the provisions of local Acts they find that there are many provisions requiring amendment and alteration and they from time to time put clauses into their local Acts to amend those defects; and I think that the time has arrived now for a general review of the whole question, in order that there might be a Towns Improvement Clauses Act in advance of the one of 1847.

925. So that Parliament has been going on making general legislation, while at the same time passing further local Acts?—Yes, the town clerks and the clerks of local boards are constantly in communication the one with the other, and when we come to Parliament for Improvement Acts we get as many modern Acts as we can, and we take out all the new improvements and make suggestions to each other, so that in fact the Improvement Acts now are becoming very heavy and expensive enactments.

926. Has the town of Halifax contemplated some such codification of its own local powers?—I am constantly applied to to codify our Acts; this book in my hand contains the Public Health Acts and the Sanitary Acts; we have four local Acts, and then there are all the Lands Clauses Consolidation Acts, the Waterworks Clauses Acts, the Police Clauses Acts, and the Commissioners Clauses Acts. I do not think I could go through the whole list, but I have no doubt that if all our Acts that are in force in Halifax were put together we should have a volume twice the thickness of this.

927. Will you now state consecutively the various objects of such an Act as you have suggested?—Of course it would have to be codified in pretty much the same way as our General Consolidation Acts are codified and the Towns Improvement Clauses Acts. You would first of all have to determine the local authorities who were to carry out the provisions of the Act; then you would have to provide for the different officers who are to act under the board, the law officers, medical officers, surveyors, inspectors of nuisances, and medical inspectors. Then you would have to follow up the provisions of the Public Health Act, and the Nuisances Removal Acts analyzed and of course eliminated, as many of those clauses have been repealed year after year, and they want codifying; provisions respecting the laying out of new streets, the erection of new buildings, town drainage, and power to enter lands for the purpose of carrying out a system of drainage. We find that the local boards are very much punished by owners of property claiming under the provisions of the Public Health Act compensation for making main sewers through their lands. Those sewers become drains for their own estates when they are laid out for building purposes, and yet we have to pay heavy compensation for going through the land to make the sewers; I think that when sewers are made for public purposes there ought to be no compensation paid beyond surface damage, providing the scheme in the first instance has received the sanction of the authorities, or was admitted to be for the advantage of the district itself.

928. Then would you have one authority in each place for all purposes?—Yes, for all purposes.

929. Would that also have this desirable effect of making all the areas of different works coincide?—I think so. In Halifax we have both the waterworks and the gasworks, we are the local authority for sewage, and we have the markets and the cemeteries under one Government, when our streets are broken up for repair we inquire whether any alterations are required in the water pipes, or gas pipes, or sewerage works, they are carried out at the same time at considerable less cost than they would if all those different undertakings were in different hands. Our rates in Halifax for all purposes, excepting poor rates are 2*s.* 6*d.* in the pound, the rateable value of the town is about 200,000*l.* and the population is 57,000.

930. Have you any debt in the way of loans taken up for works?—The capital required for all our undertakings of course is raised by borrowing money, pledged upon the undertakings and the rates. For instance, on our waterworks we have expended 320,000*l.* already, and we have borrowing power for 500,000*l.* and we are going to expend about 150,000*l.* more very shortly to increase our works. We have also got 168,000*l.* expended in gasworks.

931. Have you a good survey of your borough?—We are having one made, and there ought to be a clause in any Public Health Act that may be passed of this kind making it compulsory upon all local boards in all large towns to have a survey made on a considerable scale.

932. What would be the particular benefit of that?—The object of a good survey is that when a plan is sent in for street improvements or new buildings, you at once see to its position and the locality, whether it is likely to interfere with any other street improvement or to narrow a street. Halifax has long been considering whether we ought to have this plan, at last it has become absolutely necessary, and we are expending 2,000*l.* in having this survey completed.

933. What is the scale of your survey?—I believe it is 33 feet to an inch, it is a very large scale. The ordnance map is six inches to the mile; ours is a very large scale. The 4,000 acres, I believe, would cover about eight acres if the map were made into one, but of course we are keeping it in sections for the sake of convenience. Upon this plan we shall lay down all our pipes, water and gas, and sewage, depth of sewer, size of the sewers, and all the house drainage, the new plans that come in for approval will be immediately entered upon this plan directly the works are commenced. Then after we have a perfect plan in our possession we can send the particulars to the town's valuer, who will assess the property and brings it into rating directly it is completed.

934. When you suggest that owners of land should not be able to claim compensation for sewers being carried through their lands, do you think that the powers of extending sewers through lands are sufficient at present?—Yes, I think that the provisions are sufficient; but I think that we are mulcted very materially in damages. Instead of having those damages assessed under the provisions of the Lands Clauses Consolidation Act, I think that it would be much better that a simple plan was adopted, and that all costs connected with those inquiries should be taxed by the Taxing Master of the Court of Queen's Bench, and that they should not be left to the arbitrators to tax.

935. You would give an owner an appeal, would you not?—No, I do not think that there is any necessity at all for an appeal unless it be to the Local Government Act Office.

936. Have you any suggestion to offer as to using streams for sewers?—In many large towns where dyeworks are established and large cloth manufactories are carried on, we find the streams very black from the dyeworks; many of the towns also drain into those streams, and I think that the provisions of the Public Health Act with respect to obtaining injunctions against local boards to prevent draining into those streams are too arbitrary. I think if you injure owners below on the stream where the waters are comparatively speaking pure, the provisions cannot be too stringent, but in a manufacturing district where really the amount of injury done can scarcely be ascertained from the dirty state of the stream which has possibly existed for many many years, say 40 or 50 years, it is very hard indeed, that local boards should be restrained from draining their sewage into those streams under such circumstances. Then again, utilising sewage by irrigation works is almost impossible in thickly populated districts. As soon as we take our drainage from Halifax down to the bottom of the Hebble Brook we immediately come into another local board district, and they complain that we are bringing a nuisance into their district, so that the question is one of very great difficulty in densely populated places.

937. Are you threatened with proceedings at this moment?—Yes; we are threatened with proceedings at this moment. I may say that I think it is more a matter of retaliation, because we have been compelling a member of the town council to consume his own smoke, he is retaliating upon us by threatening proceedings to restrain us from draining our sewage into the Hebble, but the nuisance upon his own premises is considerably greater than the nuisance of the brook.

938. Have you any suggestion to make with regard to byelaws relating to new buildings and new streets authorized to be made under the Local Government Act of 1858?—I think that they might now assume the form of enactments.

939. Have you clauses in your Halifax Act for that purpose?—Yes, in the Act of 1868.

940. Have you any suggestion to make as to provisions with regard to houses and streets?—I think that provisions with respect to the removal of nuisances in the construction of new houses ought to apply to old buildings as well as new. For instance, there is a regulation that no habitable room shall be constructed over a privy or a watercloset; that is a very proper thing, but the law does not go so far as to say that when you find a room over a privy you can compel the owner to remove it if it be an old house, a house that has been constructed previous to the passing of the Public Health Act, or previous to the Act being adopted by the locality, if it is actually a nuisance and injurious to health you can compel its removal.

941. Do you think it would be wise by the Act of Parliament to enter into such detail, or in your opinion would it be better that such things should be more under the supervision of the borough surveyor?—That is rather a wide question. I think that the local authorities ought to have full power with respect to the construction of houses and their position, and also with respect to the construction of streets. In many places land is so valuable and cannot be obtained except at high prices; then builders will build nests of houses back to back, leaving very little room indeed for privy and ashpit accommodation, and the consequence is, that you will find in many cases 10 or 12 houses back to back, there will be five or six on each side, and at the end a nest of privies, perhaps one to every two houses, with ashpits connected, and those who live at the extreme end of the row would have to walk the whole distance to get to those places. They are very filthy places and very injurious to the whole neighbourhood; young people of both sexes meet there, and altogether they are injurious not only in a sanitary, but in a moral point of view.

942. But do you think that the question of what is the best mode of drainage and the best kind of privy is sufficiently settled to make it a matter of actual enactment by Parliament, or do you think that the borough surveyor might control those things?—I think that the local board might control those things.

943. Having made your chief proposals with regard to towns, you have suggested that a good Nuisance Removal Act is all that is wanted for rural districts, what do you think should be the authority to carry out the Nuisance Removal Acts in rural districts?—I think that the overseers of the poor or the surveyors of highways in rural districts would do very well.

944. Have you had much experience of the local government of villages and rural districts?—Yes, I am clerk to two rural local board districts where they adopted the Public Health Act greatly against my advice. I happened to be the churchwarden of one township and had to take the chair when the Act was adopted; I advised them against it, but the love of self government prevailed against my arguments, and they adopted the Act. It was no earthly use adopting the Act; it was done to prevent being added to a highway board district, no improvements whatever have been carried out under the provisions of the Public Health Act. They just go on as usual levying their highway rate and a general district rate to cover the salaries of officers, which is a very small thing indeed.

945. Do you think that the parish authorities would carry out a good Act, or do you think that the board of guardians as a rather larger body would carry it out more effectually?—No, I do not think that the board of guardians would do, because the unions in our district are very large. I think that you must have a body more immediately resident in the township itself.

946. But are you not afraid of a mere vestry acting in too narrow a spirit or of their officers being afraid to act with firmness?—Not if the Act is sufficiently stringent to make it a duty upon those parties to carry it out.

947. In what body would you place compulsory power to make those local bodies act?—I would give any ratepayer power to compel the local authority to carry out those provisions. I would impose the duty upon the overseers of the poor, or the surveyors of highways, and in the event of their refusing to carry out those provisions I would have a summary process before the justices.

948. That is much as it is now, is it not?—Very

J. E. Norris, Esq.

6 May 1869.

much the same as it is now, but the provisions are too large for the requirements of the rural districts.

949. Do you believe that the Acts are really carried out in rural districts?—Very little indeed, scarcely at all.

950. Then you think that it is the law which is in fault and not the machinery?—I think that it is the law that is in fault, giving power to the ratepayers to adopt the provisions of an Act which are totally unsuited to the requirements of the locality. For instance, the township of Midgley to which I allude, has an acreage of about 3,000 acres, and a good half of it is moorland where you shoot grouse, yet the Public Health Act is in operation there, which is manifestly absurd.

951. (*Mr. Hibbert.*) You stated that you would apply the Local Government Act only to large populations over 10,000 or 12,000; would you make it compulsory on such large places to adopt it?—I think that would be very desirable.

952. You have said that you would put rural districts under Nuisance Removal Acts; would you approve of the plan for making the Local Government Act compulsory upon all large populations, say over 10,000, or some other number, and then having another Act for parish or township government which should be compulsory, and conferring some of the powers under the Local Government Act, but not all of them?—Yes, I think so. I think that the provisions of the Towns Improvement Clauses Act, of the Public Health Acts, and of the Nuisances Removal Acts may be very advantageously divided so as to make one portion of the general Act applicable to large towns, and another portion applicable to rural districts.

953. Would not it be better to have an elective board in rural districts, rather than to leave the powers with the surveyor of highways and the overseers of the poor?—Yes, perhaps that might be better.

954. Would you think it more advantageous to have on that board the justices resident in the district as *ex-officio* members?—We find that the justices as a rule seldom interfere in those matters. I do not know what they may do in the rural districts, but with us they do not exercise their rights as *ex-officio members;* however, I think that it would be a very great advantage in a rural district that a magistrate should be on the board.

955. I presume you are aware that the surveyors of highways have authority over the highways of parishes, and the vestries have authority to make sewers or drains, but have no authority to interfere with the roads?—If they are constituted the sewer authority under the late Act, of course it would be the case that the sewer authority would have one control for the sewerage and the highway surveyor would have a different office.

956. If you had one board to carry out the whole powers in parishes you would get over that difficulty, would you not?—I think that if highway boards were constituted, it would be very desirable to make them the local authority for the drainage purposes in a rural district.

957. Supposing you had a parish board formed in this way, and you had an overriding authority either in the Home Secretary or in the county financial board, would you consider in case there was any difficulty in carrying out the powers, that that overriding authority might be sufficient to compel the parish authority to carry out what was necessary?—If the Act is sufficiently stringent to make it a duty upon the local authority to carry out the provisions of the Act and induce it to do so, I think that some summary proceeding before the justices, with an appeal to the quarter sessions would be quite sufficient, and would answer the purposes that you have indicated.

958. You think you would prefer that, to leaving the overriding power with the Home Secretary?—Yes, I think so, if the Act is sufficiently stringent of itself to impose the duty.

959. You have stated it as your opinion that the byelaws now in force in towns might be enacted in some general Act; do not you think that there would be an objection taken to that which would prevent any new byelaws being made?—No, I do not think so at all. I think you will find that, first, there is a general objection to the local authorities making any regulations or framing any sort of regulations for the purpose of compelling the enforcement of certain rules as to constructing houses, the thickness of walls, and the levels of streets, and so forth; but after they have once got into operation you find that the owners of property come to the local authorities, and will point out whenever there is likely to be a disturbance of the system of continuous streets and the laying out of land advantageously.

960. Is it not a fact that the byelaws which are now sent up to the Secretary of State for confirmation are much better than they were some years ago?—We do not send the byelaws to the Secretary of State for confirmation; we constantly receive circulars to say that they regret that such and such a byelaw has been upset by the Court of Queen's Bench, and suggesting an alteration. We prefer under the circumstances to settle our own byelaws, or have them enacted in a local Act, which is a very expensive process. There are certain regulations which I think have become absolutely necessary in all localities. I think it is very desirable that before a house is built, or a new street is set out, a plan should be sent in to a certain scale setting out the line of the street, the level, the proposed mode of drainage, the depth of the sewer, and how it is connected with an existing system; and with respect to buildings, the distance from the centre of the street, the thickness of the walls, and the height of the rooms, to show that there is sufficient ventilation; and I think that plans which may be vetoed by the local board as being contrary to those special regulations ought to be rejected, and that the local authority ought to have power to reject them.

961. Is it not a fact that if the byelaws were enacted in some general Act, and you found that they did not work well in any particular town, you would be unable to alter them without coming to Parliament?—That would be the case.

962. Would not that be an objection to their being enacted in any general Act?—No; because so long as the Act remains an Act we can always enforce them; if we have to come to Parliament again for the purpose of getting additional powers, the rate-payers can then petition Parliament against the provisions, if they are found to be arbitrary, and have them modified. But I think that there are certain regulations which ought now to assume the form of enactments.

963. I understand you to say that at Oldham and some other place they had obtained local Acts which were much in advance of the Acts in other towns?—They found that the byelaws would not work, and they did not wish to have so many Acts of Parliament consolidated with their own, and they preferred to have one simple Act; in fact the Towns Improvement Clauses Act, applicable to Oldham in one Act, and a codification of such Acts as they thought were necessary, and they found that a very simple process, but it is one which I dare not undertake at present for fear of interfering with existing interests which have sprung up in consequence of the application of those Acts.

964. Are you aware that in the Salford Act—differing in that respect from the other local Acts that have been passed—they give all the clauses in *extenso* which they incorporate from the different general Acts?—They do.

965. Do you think that that is an advantage?—Of course it is one way of printing a bill with the Consolidation Act set out in full in the text, and that was done in Salford, I believe. It makes it more expensive in one sense, but I do not know whether it is not a good plan to have those provisions brought together in one Act.

966. But is it not much better for the ratepayers that they should know exactly what the law is?—I think that the ratepayers are in the habit of putting their own construction upon an Act of Parliament, very often totally different to what it ought to be, and if there are too many town clerks in the town council you very often find that you cannot guide them at all, and your own opinion is questioned upon the construction of your own Acts.

967. (*Mr. Whitbread.*) With regard to the pollution of streams you express an opinion, I think, that it was a hardship upon manufacturing districts to call upon a town to provide other means of getting rid of the sewage instead of carrying it into the stream—where would you draw the line?—I think there are so many conflicting opinions upon the question now that we ought not to be called upon in a hurry to expend a large sum of money to get rid of our sewage until Parliament has determined what course shall be adopted. It seems to me to be the general opinion that irrigation works are the best means of getting rid of our sewage so as to relieve it of the deposits and pass the water in a purer state into the river. That is decidedly the best plan that you can adopt in a district where you have hands available for the purpose; but I think that in a manufacturing district like Halifax, where the water, and possibly the sewage, has received so many chemical agents from dye-works, that may possibly neutralize the beneficial effects of the sewage for agricultural purposes, we ought not to be called upon to expend large sums of money in irrigation works or in getting rid of our sewage until there is some definite and defined rule laid down by Parliament. There is a strong opinion that deodorising and filtration cannot be done effectively, and yet some thing will have to be done, no doubt, to get rid of our sewage. I am afraid that if we take our sewage into the district down below Halifax, we shall very likely be indicted for a nuisance by those districts.

968. Your answer, I think, covers the whole area of the country, not excluding the manufacturing districts; it goes to the effect that every case should be dealt with on its own merits?—Yes, I think very much so. Croydon, and some other places, I know have very large irrigating works, and they do very well, because they have a large tract of land which they can irrigate; but we no sooner get out of our borough than we are in another local board district, with a population of 10,000 or 12,000 odd, and if we take it higher up, and go up into the Calder Basin we come to Sowerby Bridge where there is another local board, and those people may require for themselves the ground we are seeking to get for irrigating purposes.

969. Would not that be met by increasing the areas?—If you mean that several towns should unite together to carry their sewage a long distance, that would be very expensive. That is one plan which is suggested in the report of the commissioners on the pollution of rivers, but it would be very expensive.

970. (*Mr. Bircham.*) Are we to understand that you would be in favour of bringing rural districts into unions of about 12,000 inhabitants?—Villages or townships having a population of 10,000 or 12,000 I think ought to have a Towns Improvement Clauses Act, such as I have suggested.

971. Then you do not approve of bringing villages or small populations into unions amounting in the whole to 12,000?—No, not at all. I do not approve of that.

972. You stated with regard to water supply that it would be unnecessary to provide it in the rural districts, but I think your illustration was confined to the cases of rural districts in the immediate vicinity of towns?—Yes, within the water supply of large towns.

973. But there must be vast districts which are not in any such predicament?—Quite so; in cases of that kind of course it might be desirable that they should have power to find water for themselves.

974. In large rural districts or towns not amounting to such a population as 8,000, or 10,000, or 12,000, you would leave the parish, would you not, as the unit?—Yes.

975. Would you consider that the Nuisance Removal Acts would be sufficient for the health government of such districts?—Yes, for such rural districts.

976. Is not the action of the Nuisances Removal Act rather remedial than preventive?—No, I do not think it is.

977. Must you not have the nuisance in active existence before the Act comes into operation?—Yes, and then it would be remedial, of course.

978. Would you have no preventive or anticipatory jurisdiction in the rural districts?—I think that the sewer authority would have that jurisdiction. You generally find nuisances collect for want of proper drainage works.

979. Then you would contemplate that there should be an authority capable of making sewers for the proper sewerage of the district?—Certainly. I think that all those provisions which are necessary for the removal of nuisances ought to be available in rural districts.

980. And would you extend that to the anticipation of nuisances in rural districts?—Yes. But I think that the rules with respect to streets and buildings, which large towns more especially require, are not so necessary in rural districts. It would be a very arbitrary thing to say in small villages—"You must build your cottage of a certain size, in such position, on such a distance from the centre of the road." I do not think that that is necessary; but in a town it is very important that there should be sufficient space left for ventilation and for the traffic as well.

981. But in rural districts, although it might not be necessary to say within what distance of the centre of the road a house should be built, there might be rules necessary also for the health of the inhabitants?—Yes, for instance, I think you might compel them to whitewash their cottages two or three times a year.

982. And provide that there should be water supply, privies, ashpits, and conveniences of that description?—That I should leave in the hands of the highway board, or the surveyors of the highways having the control of the roads.

983. But do you not think that it would be better in the hands of a board than of the surveyor of parishes as the unit?—As I suggested, if that board were to be elected under the provisions of an Act of Parliament, of course it would be better to have a special board appointed for those purposes than to leave it in the hands of the ordinary surveyors.

984. Would it occur to you that in bringing the Sewage Acts into operation in rural parishes unless they were brought together into unions, there would be an absence of the proper officers in a parish to carry them into effect?—That very much depends upon the size of the locality. The parish of Halifax is a very large district, considerably larger than the county of Rutland, but it is made up of something like 25 townships, each township having the power of levying its own highway rate and poor rate for poor law purposes, except so far as the Union is concerned, and of managing their own township affairs as individual parishes.

985. You spoke of the Lands Clauses Consolidation Act. You would think, would you not, that a power to obtain an easement through a landowner's property, as distinguished from a power to purchase the property, would be salutary?—I think so. Under the Public Health Act it is not termed an easement, but you have a right to enter and go through lands if the surveyor says that it is necessary for the purpose of a system of sewerage, by giving notice to enter; but after you have entered the owner has the power to compel you to pay him compensation for any injury that you may do by going through his lands. In nine cases out of ten it is an imaginary injury—it is a mere easement, which is a very great advantage to the property itself, and arbitrators are appointed and sit

J. E. Norris, Esq.

6 May 1869.

for two or three days hearing the evidence of the surveyor, and all sorts of imaginary injuries are raised, and I think it is trifling with the public funds, and acting contrary to the interests of the public, that compensation should be paid for such works.

986. But is it not the case that if you were to apply to the Secretary of State to give you compulsory powers under the Local Government Act he can only give you power to put in force the Lands Clauses Consolidation Act?—Not for purposes of towns drainage, we do not require the Lands Clauses Consolidation Act for that.

987. In any case in which you do require compulsory powers over land the Secretary of State gives you the Lands Clauses Consolidation Act?—If we want compulsory power to take land for any Towns Improvement Act we have to give notices and apply to the Home Office to send down an inspector to report, and he prepares a provisional order which is subsequently confirmed by Parliament, and then after Parliament has sanctioned the order, we have compulsory powers to take lands under the provisions of the Lands Clauses Consolidation Act.

988. Those are confined, are they not, to the taking of lands as distinguished from acquiring any easement?—Quite so.

989. (*Mr. Richards.*) You have spoken of the powers given under byelaws; is not one of the powers that is usually given with regard to the quantity of space that should be left around a new building?—Yes.

990. If those byelaws became an enactment how would you meet the exceptional case of a house in a very valuable street where ground is very valuable?—I think that the owners of property ought to give way for the public benefit, and that the sanitary regulations in a town ought to be considered before a landowner's interests. I think back-to-back houses are exceedingly injurious, and if you forbid the construction of such houses in populous districts, you would find that a better class of house could be built a little way out of the town more cheaply than having those houses built in the thickly populated parts of the town. If you do not carry out such regulations, you have a labouring class resident in the centre of a populous district, and a few years hence you have to remove all those houses for street improvements, and for the general improvement of the locality; whereas, if you compel the owners to build houses under proper sanitary regulations, they will go out beyond the populous districts, and will acquire land at a cheaper rate, and they will construct houses which altogether are much better, and have much better sanitary advantages than if they built in the centre of the town.

991. My question referred rather to one of the main streets of a town; would you insist upon the same space around a house that had been taken down to the ground floor in a main street as you would in a locality which is not in immediate contiguity to the main thoroughfares of the town?—I think there should be sufficient space left in the rear of the house. In the centre of a town every shop or house would be facing some large street. I believe that in most towns the actual height of the house is regulated by the width of the street, and therefore you have sufficient space in front, but you ought to have sufficient space to the rear of them.

992. Would you define that space in an enactment?—Yes, according to the area of the house. I believe it is so in the metropolitan Acts now.

993. You are aware, are you not, that in byelaws in practical operation there are exceptions allowed by local boards?—Yes, but you cannot get all local boards to think alike.

994. You have spoken of the powers given by local Acts for the manufacture of gas and the supply of water; and you stated, did you not, that there was economy in having the roads under one authority?—I think it is very desirable that the local authorities should if possible have the water and gas in their own hands.

995. In any new enactment with regard to public health, which might be passed as the result of this Commission, would you extend the power to towns to manufacture their own gas?—Yes, I think so, where gasworks and waterworks do not exist. If there are gas and water companies, of course they must be purchased, and that is a question entirely of agreement; but I think that where no gasworks or waterworks exist in populous districts, it would be very desirable to give to the local authorities power to construct them; but as to the extent of borrowing powers necessary for such works, I think there ought to be a controlling influence—that the Local Government Act Office or the Home Secretary ought to have some power to restrain the improvident borrowing of money for such purposes.

996. Assuming that a public sewer goes through a street, and the local board, under the provisions of the Public Health Act, calls upon the householder to drain into that sewer, would you give the person who has received notice power to go through any land that the engineer or surveyor thought desirable that he should go through?—I think that the plan ought, in the first instance, to be adopted by the local authority, and if so I think there ought to be compensation to the private owner. You should distinguish the difference between a public sewer, applicable to the whole district, and one which simply is used for the purpose of draining individual houses, or two or three houses. I think, in the latter case, the burthen of the cost of that drain ought to be borne by the parties who are immediately benefited by its construction, and that some compensation ought to be made to the owner affected by the making of the drain from a private house till used by him for his own purposes.

997. Would you in rural districts think it desirable that the local authority should have the plan of a house submitted to them previous to its being built?—No, I do not think that that would be necessary in rural districts.

998. (*Mr Powell.*) I presume that the case which you mentioned at the commencement of your evidence of the difficulty which may arise in a place like Halifax, if the community is forbidden to discharge sewage into the river, was fully laid before the Rivers Pollution Commission when it inquired into the condition of the Aire and Calder valley?—Yes, very fully.

999. Can you state to me any reason why the highway board should be so unpopular that localities have resorted to the Local Government Act with a view to escape the further operation of the Highway Act?—Merely from a natural love of self-government that exists in the manufacturing districts.

1000. Not from fear of any burthen that the Highway Act would impose?—I do not think so. I do not think that that was ever taken into consideration at all.

1001. I presume that in the Act which enabled you to raise half a million for the purposes of water supply at Halifax, you had power to borrow?—We had.

1002. How many years are allowed you by that Act to repay the sum so borrowed?—Those powers have been varied from time to time. In 1853, when the first Act was obtained for our waterworks, 40 years was fixed as the time within which we were to pay off our debt. In 1858 an extension of time was given for the purchase of land and the construction of works, and I think 50 years was given. In 1865 I applied for an extension of the boundary of the borough, and in that case 50 years was again repeated. In 1868, when we applied for an extension of our waterworks, and obtained powers to borrow 500,000*l.* in the whole, I got 100 years.

1003. There does not appear at first sight to be any principle which has regulated the number of years. Do you know of any reason why you should have 40 years on one occasion, 50 years on two others, and 100 years on the fourth occasion?—I think that for towns improvements, new streets, new bridges, or

anything of that kind, it is desirable that it should be limited.

1004. But it is the fact, is it not, that there does not appear to be any principle?—I know of no principle.

1005. Do you think it is just that two towns competing with one another in the same markets should in the one case have 100 years to repay their debt for water, and in the other case they should only have 40 or 50 years?—If the circumstances are identical, of course there can be no reason in it, but if the circumstances vary, there may be very good reasons for giving 100 years to one and limiting the other to 50.

1006. Could you describe in a few words the considerations which should govern Parliament in saying why one town should have 50 years and the other town 100 years?—Take Halifax, for instance; the rate-payers within the borough have pledged themselves and pledged their borough funds for the repayment of the monies necessary for the construction of our waterworks. We do not receive the entire benefit of those works within the borough; we have a large area of supply including many townships, and we are compelled under the Waterworks Clauses Act to supply those districts if they call upon us for water. It is a process of gradual extension, and if an accident were to happen to our works, or there was a bad trade, so that the sale of our water did not increase and progress year by year, I think that in such case the undertakers ought to have a longer period within which to pay their debt, so as to give them an opportunity of fully developing the scheme and obtaining customers for their larger undertaking. If you are allowed to borrow a sum of money for an undertaking which is confined exclusively to the town itself, and not to a very large area, then I think that there should be a rule laid down, and 50 or 60 years would do; but where you have a large area of supply and you are obliged to expend a large sum of money in the first instance with the risk of having customers, you ought to have time allowed to pay that debt off so as to allow the income of the undertaking to come in to meet the sinking fund.

1007. You mean that given a certain length of piping and given the same population as that with which you have to supply, if you have populous districts to traverse your piping for your own population, you have to construct works on a larger scale in view of those contingencies that you mentioned?—Yes, we have.

1008. But do not those populous neighbourhoods pay you a water rate?—They pay no rate at all, they pay a rent for the water they get.

1009. And that recoups you to a certain extent, does it not?—Only if they take it; we can lay no rate outside our borough; we can only charge for the water consumed, and if we had any accident to our works, or if our income is not sufficient to meet the interest upon the monies expended upon the construction of those works, we have no power to lay a rate. We have all those contingencies to meet and the risk of accident, and therefore I think we ought, considering everything, to have a longer period to pay that debt off in than if we simply had works sufficient for the immediate requirements of the town.

1010. Is not this the case, that the duty is imposed upon you of constructing your works, but there is no compulsion upon the localities outside the town to take advantage of those works?—Precisely so.

1011. And you base your argument upon that?—Yes, I do.

1012. I think you said that the difficulties in making byelaws arise from questions which occur from time to time as to whether those byelaws were *ultra vires*?—Yes.

1013. Do not you think there would be great difficulty in framing an Act of Parliament comprehending the whole country which should be so far elastic without the assistance of byelaws as to meet the case of different communities?—No, I do not think there would be.

1014. But you must come to byelaws on the one hand, or to pure discretion on the other hand, and is not a byelaw a security to the community against capricious action on the part of the local authorities?—Yes, if those byelaws are to affect the regulation of some slaughterhouse or market, or anything of that kind, I think such regulations are good; but when provisions are considered to be absolutely necessary, and common to all towns, I do not see why they should not assume part of an Act of Parliament.

1015. I will give you an illustration. A town in Yorkshire says that a street of a certain length shall be of a certain width. It might be very convenient for that town to impose such a law, but might it not be extremely inconvenient to impose a law of such stringency upon all the towns in the country?—We have such a provision in our Acts for 30 feet; we will not allow any street to be made of less width than 30 feet; but we have also the power when plans are sent in to say that the street shall be of a width up to 75 feet, but we are bound to pay compensation for the land taken.

1016. Is that point defined by your Act, or is it by a byelaw?—It is by our Act.

1017. With respect to rural districts. You stated, did you not, that you are a clerk to the local board of Hipperholme?—My partner is clerk to the local board of Hipperholme, and I know the circumstances.

1018. Might not Hipperholme be described as a manufacturing hamlet. It consists of a number of mills and large manufactories, and also of inhabitants engaged chiefly in those works; and the population according to the census of 1861 appears to be 7,320. Why should you deal with such a community as a rural community?—If you look at the census of Hipperholme, I think that it says Hipperholme-cum-Brighouse. Hipperholme-cum-Brighouse is a township consisting of two hamlets. There is the hamlet of Brighouse, which is a townlet I daresay of from 8,000 to 10,000 inhabitants, probably more; and Hipperholme is a rural hamlet of the same township, consisting of gentlemen's villas and residences. There is scarcely a mill in the place. Mr. Titus Salt lives in a large house there at Cliffe Hill, with a large park around it; but there are no mills in Hipperholme. The population is chiefly in the hamlet of Brighous That is a townlet, and not only does Brighouse consist of the townlet of Brighouse, but it goes into another township, the township of Clifton. Hipperholme proper is purely a rural district, consisting of gentlemen's houses, villas, and farms. Many of the farms have been struck out of the district. We have not got the whole of the hamlet; we have only taken the portion of that hamlet which may be considered the populous district, but yet I think that a great many provisions in the Towns Improvement Clauses Act are not at all applicable to that district.

1019. But if you have a village such as we know exist in great numbers in Yorkshire, where you have a mill, where you have a population employed in that mill, and where you have that population, although it may be comparatively small in number, still often very dense on the site which it actually occupies, why should you not have regulations strongly in favour of health in the case of such a community?—The provisions of the Nuisances Removal Act would be quite sufficient for a district of that kind.

1020. Do not you require provision against overcrowding?—Those would be in the Nuisances Removal Act.

1021. But do you not require some provisions as regards the width of the streets?—No, that is under the Towns Improvement Clauses Act. I do not think it is necessary in a district of that kind to have provisions as to streets. It is very desirable to have provisions as to buildings, but not as to streets.

1022. But you would have byelaws, would you not, with reference to what you so much complain of, back-to-back houses for example?—I should prefer an Act for sanitary reasons.

J. E. Norris, Esq.

6 May 1869.

1023. You stated that in the case of drains passing through private properties, the community should pay for surface damage, and surface alone?—Yes, for a public sewer.

1024. What do you mean by the term surface damage?—Supposing you go through a field for the purpose of getting a proper gradient of outfall for your sewer, in that case the farmer ought to be compensated for the injury done to his land.

1025. But you know from your experience that that which is to-day a mere field in the neighbourhood of Halifax or Bradford will, in a very few years, become valuable building ground, and then the owner of it, if there is a sewer through his land, cannot build upon the sewer or within a certain distance from it without risk?—That is quite true; but his land would be very much increased in value by reason of having a sewer through it; it would be taken no doubt in the most advantageous position according to the formation of the land through which it passed.

1026. Do you think that the owner is entitled to no compensation for the occupation of a certain portion of his land by the sewer?—No, I think not for an easement of that kind.

1027. But we will suppose that there is a large water main which occupies considerable space, what would you say as to that?—But that is not a sewer; you would have to purchase an easement for a water main to go through a man's land; you might move a water main at any time, whereas a sewer when once made is a permanent work, and a permanent work of that kind is one which is supposed to be placed in the best position to meet the requirements of the district for drainage purposes. A waterpipe is a pipe which may be shifted according to circumstance.

1028. Then your answer would apply to drainage alone, and not to water-pipes?—Not to water-pipes; certainly not.

1029. Have you found any cases in your experience where the local authorities have taken advantage of the Acts, and have exercised their very considerable powers, and so have borne hard upon the owner's property?—No, I do not know any such instances.

1030. Supposing a community owned a market, and any individual were to build a structure which the community might think would come in competition with them as owners of the market, have you heard of any cases in which the local authority have been oppressive?—I do not know what you mean by oppressive. If you mean this, that where a market has been established in a town, and the provisions of the Markets Clauses Act are in operation, and a rival market has been established in a court, yard, or field, within the ambit of the market's authority, the market authorities of the town should see that the competing market should be tolled or contribute to the public who have established the public market for the benefit of the inhabitants at large. I think it is only fair that they should enforce the law against the other market.

1031. Do you think that the local authority should prevent anything being built which in their opinion might become a rival market?—I think so, and I think with respect to slaughterhouses that where the local authority has constructed good and commodious slaughterhouses, sufficient for the requirements of the district, they should compel all slaughtering to take place in those slaughterhouses, and not allow other slaughterhouses to be planted here and there, all over the town.

1032. Are you aware that in the neighbouring town of Bradford the byelaws against back-to-back houses have been found to diminish the supply of houses so much that those byelaws have been modified?—I believe there has been a great contention in the town council upon the question of back-to-back houses. I think the question was taken up by land speculators and a difficulty in the town. There were a great number of back-to-back houses, and the injustice appeared to be this, that to forbid the continuance of those houses was a hardship to the owners of property immediately adjoining to those who possessed back-to-back houses, and that to prevent that injustice you should sweep them away altogether.

1033. But are you aware of the fact that the byelaws against back-to-back houses had been a considerable time in operation until there was an excess of population as compared with the supply of houses, when they found it necessary to relax those byelaws in order to house the population?—I believe there was a division in the council, and that at one time the byelaws were confirmed, and at another time they were modified. It entirely depends upon the constitution of the council. Probably, there may be a council next year who will carry resolutions that there should be no such thing as back-to-back houses. There is a bill before Parliament this year promoted by the Keighley Local Board, which has gone through the committee of the House of Commons where they have scheduled the provisions of the Public Health Act with respect to houses and streets, to give them the force of law, and in that case they have not allowed more than four houses to be built together in one nest.

1034. Is that by a private Act?—Yes.

1035. And you would wish to incorporate the provisions of that clause in the general Act?—Yes, I think that it would be a very good thing, it would ensure ventilation around buildings.

1036. (*Mr. Shaw.*) You told us that you thought that there should be a medical officer to every local board?—Yes, in large towns.

1037. Have you considered how he should be appointed and removed?—I think he ought to be at the will of the board the same as the other officers.

1038. Would not there be a difficulty if he is an intelligent and scientific medical man rather in advance of the state of things around him? If he did his duty vigorously he might give displeasure to his employers and might be arbitrarily removed?—Of course all officers are more or less looked upon as under the authorities that set them in motion, and if they found that their officers were too zealous possibly you might find some boards who would deal with them in the way you suggest; they would consider that they were going rather beyond the scope of their office, but if such a medical officer found that to be the case he should resign.

1039. That would not help the community, because the probability would be that if he did resign, an inferior man would be appointed in his place?—Possibly, but if those officers are to be appointed by the local boards we must run the risk of that.

1040. Have you considered the point of the Secretary of State, or any other authority, having a veto upon his removal?—No, I have not thought of that, because when I made the recommendation that a medical officer should be appointed, I made the recommendation as applicable more especially to towns of large populations of something like 30,000 or 40,000 or 50,000 inhabitants and not small towns of 10,000 or 12,000. I think that an inspector of nuisances is quite sufficient there, but in a town like Halifax with 57,000 inhabitants, although the council might not like to appoint a medical officer, still my own view is that it would be an advantage to the town to have a medical officer.

1041. Has it not been the case, or been supposed to be the case, in many places, that that very objection has arisen, and that the more an officer did his duty the less he pleased his employers?—I do not know any particular instance, but such cases do occur no doubt.

1042. You mentioned, did you not, that in some cases byelaws at present are made with the assent of the Secretary of State, and you say that those are liable to be upset by the Court of Queen's Bench, because they are *ultra vires*?—They are not made with the assent of the Secretary of State; they are made by the local authority and sent up to the Home Office, and after a certain period they come into operation, but the Secretary of State has no power to inter-

fere with those regulations, and we must run the chance whether we are exceeding the law or not.

1043. Would it meet your views to have power to make byelaws to be assented to by some department like the Local Government Act Office, so that they may have the force of a statute when once they are made?—I had a bill prepared in 1864 which I left with Mr. Taylor of the Local Government Act Office, and asked him if he would promote it through the Home Office for the purpose of giving legal effect to byelaws, until they had been declared illegal by *certiorari* before the Court of Queen's Bench, so as to prevent any question arising before justices as to the reasonableness of those byelaws. He approved of the bill at the time, but I think he thought it better to wait till certain byelaws assumed a common object for all towns, and then probably they would be incorporated in some future Act.

1044. I think there was some difficulty suggested by you or pressed upon you, that if byelaws were incorporated in an Act they would be too rigid; that might be met, might it not, by an Act saying such and such things should take place unless the local authority should otherwise order?—I am not prepared to do away with byelaws altogether, but there are certain regulations which have assumed the form of byelaws which may now be legalized and become enactments.

1045. Speaking in the spirit of that answer, I ask you whether in any case where it was doubtful whether a byelaw could or could not be incorporated in an Act of Parliament, in the case, for instance, of preventing houses being placed back to back, the difficulty might not, to a great extent, be met by its being incorporated in this form, "unless the local authority should otherwise order"?—I think if such a byelaw as that were to be framed, and to be objected to by the community, an appeal might go to the Home Office, thus give the parties an opportunity of questioning it before the Home Office.

1046. You stated with regard to the utilization of sewage that there was great difficulty when you come into the district of another body, and then you were asked why that might not be met by extending the area, and I think your answer was that it would be very expensive. To what had that reference?—I understood the question to be this, that supposing Halifax had no ground in the immediate vicinity which was capable of being used for irrigating purposes, without going into the district of another town, Elland for instance, and when you got to Elland you could not utilize the ground below Elland without interfering with the town of Brighouse, whether it would be desirable that there should be a union of those three districts for the purpose of making a common sewer through the whole district until you reach ground which was capable of being used by the whole of that area. That is the question, as I understood, that was put to me, and I say that it would be very expensive indeed to make a main sewer of that kind, which probably would be some miles in length, and if you carry out that principle, you might drain the whole of the Calder basin into the Humber, or take it down to Pontefract.

1047. You would then have more parties contributing to the expense, would you not?—Yes, but you would also have to take up a large portion of the county and keep it exclusively for purposes of irrigation works for the sewage of large towns, and it would be dangerous to build in the neighbourhood, I think.

1048. As regards rural districts, do you not think that the great difficulty is that however good your rules may be, they come into the hands of uneducated and narrow-minded administrators?—Yes, that may be so.

1049. What is the remedy for that?—In rural districts that would be very likely to be the case, and it would be better to have a union of those rural districts the same as they have highway boards, and then to give the power to the highway board to make sewers and everything necessary for the sanitary regulations of that particular district. You are much more likely to have an educated body of men to look after the interests of the community than giving it to small farmers.

1050. Then you would not keep the parish as the unit?—No; you must remember that townships in some districts are of parishes themselves, and I do not think it is desirable to keep the parish as the unit in the rural districts, not in that sense.

1051. You would not think the evil met by interposing a county board with a certain power of overriding and modifying the decision of a narrow-minded local authority?—I think if you unite them in the way which you suggest, and if your Act is sufficiently comprehensive, it would be sufficient to leave it in the hands of the highway board to have the overriding authority; I am referring now to nuisance removals only.

1052. But the difficulty is that the local authority under the Nuisances Removal Act will not act?—No; but then I would draw the Act so as to impose it upon them as a duty that might be enforced.

1053. But the duty is to exercise discretion; and are the justices to say whether that discretion has been well or ill exercised where the local authority has done something?—I doubt very much whether a section could be framed so as to make it discretionary, and yet be a duty. If you draw a clause making it a duty to exercise discretion, it is a discretionary power, and there is no duty imposed. If you say that they shall do so and so, and say what they shall do, that is not a discretion, that is a duty.

1054. Take the case of magistrates, there are often cases which the magistrates in the exercise of a discretionary power are called upon to hear and decide, and if they hear and decide, no matter how, the Court of Queen's Bench will not interfere; but if they wholly refuse to exercise that discretion a *mandamus* issues to set them to work?—Yes, but I do not think that that quite applies to a sanitary board.

1055. Supposing that they may do a thing in half-a-dozen ways, if they have done it in any one of those ways are the magistrates to say, "You have done something but you have not done enough"?—I think that is hardly a parallel case. The justices would compel the board to carry out such provisions as are set out in the Act to compel the removal of nuisances; but what I desire is a clause sufficiently stringent to make it a duty.

1056. (*Mr. Cave.*) Have you had much experience in really rural districts?—No, I cannot say that I have.

1057. Probably you would hardly like to give an opinion as to whether the present Poor Law Union would be a good unit for such districts?—No, I should not like to give an opinion upon that.

1058. I think you said that any ratepayer, by complaining before the justices, should be able to compel the local board to act?—Yes.

1059. Do you intend that answer to apply to large towns such as Halifax?—I intend it to apply to all enactments where the duty is imposed upon the local authority to get rid of any nuisances, and where that authority neglected to perform its duty, I would give any inhabitant the power to go before the justices to compel the authority to carry out that enactment.

1060. I presume you mean in a case in which the duty was clear?—Yes.

1061. Would you give an appeal in such a case under the Justices Procedure Act to the court of quarter sessions?—Yes, if a question of law arose an appeal by case might go to the Court of Queen's Bench.

1062. With regard to fresh legislation, I infer from your answers that you consider it a question of degree, that many enactments which are now byelaws in local Acts have been found by experience to be applicable to the whole county?—Yes.

1063. And those you would bring into a general Act?—Yes.

1064. But you would still contemplate the necessity of byelaws in particular districts applicable to

J. E. Norris, Esq.

6 May 1869.

cases which might arise from time to time?—Yes, certainly.

1065. And that in such cases you should proceed as now by a provisional order?—We do not proceed by a provisional order in framing byelaws; it is a power given by the Act itself to the local authority to frame byelaws to meet certain objects.

1066. In case you wanted to make byelaws which were beyond the scope of your present Acts, you would proceed, would you not, by a provisional order to get that power?—If you mean that the machinery of obtaining power by provisional orders should also be applicable to framing byelaws, I do not know that it would be necessary to do that, but I think it would be desirable that when byelaws have been framed, they should go to the Home Office for approval and confirmation, and until they are upset by the Court of Queen's Bench, they should have the effect of law as applicable to that particular locality.

1067. If you want fresh power to make other byelaws your plan now is to proceed by a provisional order, is it not?—No.

1068. Must you have a fresh local Act?—We can only make byelaws under the provisions of an Act of Parliament, and if we want any new provisions, we are obliged to go to Parliament for a special Act.

1069. That is very expensive, is it not?—Yes.

1070. Cannot you do that now by a provisional order?—Only within the scope of the Act.

1071. Would not a provisional order which has the force of an Act of Parliament enable you to make fresh byelaws upon fresh subjects?—I do not think it would, beca use the provisional order must be based upon the Act, giving the local authority power to make that provisional order, and the provisional order must be in respect of certain objects which must be set out in the Act. A provisional order is for the taking of lands, the purchasing of waterworks, the purchasing of gasworks, or some object of that kind, but not for the making of byelaws. I have not known any instance of that being so; perhaps Mr. Taylor may know. He has put into my hands the Local Government Act, 1858, in which I find that section 75 with the subsections under it, and sections 77 and 78 are the only sections applicable to provisional orders. First of all, under the 75th section the local authority may obtain a provisional order giving them power to purchase lands compulsorily under the provisions of the Lands Clauses Consolidation Act for any purpose of the Act, —markets or whatever it may be. There is a form given of the publication of notices, and the services of notices and the petition to the Home Office. Then an inspector comes down who hears evidence and makes a report, and a provisional order is drawn up upon that report, and then an Act is passed to confirm the provisional order. A provisional order may also be obtained for the purpose of separating districts which have been once formed, if any portion of the inhabitants object to being continued within that district.

1072. But not for anything so undefined as making byelaws?—No, there is nothing with respect to making byelaws.

1073. When you speak of no compensation being allowed to a landowner through whose land a drain is carried, I presume there ought to be if he could show specific damage, such, for instance, as destroying a spring of water by the drain, which might often be the case?—I think that if the local authority did anything unreasonable, and going beyond the scope of their Act, he could go to the Court of Chancery for an injunction to restrain them from making the drain, showing that it was unreasonable, or that a better route might be taken; but as a general rule, I think that the local authority, with a competent surveyor, ought to be the judge as to the line of main sewer.

1074. But supposing that a particular line, which might be the best line, were such a line as would inflict material damage upon the individual, such as destroying something belonging to him for the advantage of the whole community, ought not the owner to be compensated in such a case?—If it is a stream that is cut off certainly he ought to be compensated, but I am speaking of the land itself. The cases have gone so far as this that where in the making of a main sewer in a road, wells or underground waters are affected there was no remedy, because no action could be brought; but if a stream is interfered with, is it protected. In fact the Public Health Act provides that no stream or watercourse shall be interfered with by the works to be carried out under the provisions of the Act.

1075. But in the case of a well within a private property for instance, which you say might be injured by a drain, would not that be a fair matter of compensation?—I think not; because that would be interfering with the general law with respect to underground water injured by adjoining wells; the owner of which could not have any remedy. If you sink a well in your yard adjoining to your house, and your neighbour sinks a well which draws the water from your well, you have no remedy.

1076. But if your neighbour comes into your yard and sinks a well there, it is a different case?—Quite different.

1077. And that is what you are proposing to do?—Yes; but my meaning was that if you make a main sewer through a man's lands for the purposes of the public advantage, there ought not to be any compensation paid to that owner for such an advantage. If you injure a stream or knock down a building or anything of that kind, that is surface damage and special injury.

1078. By destroying a well you might send a man two miles for water which would be a very serious thing?—I should avoid going near a well. I should not touch it.

1079. You would not carry your principle so far as to prevent the landowners showing material damage?—No, perhaps not; but I cannot help thinking that a clever surveyor can make out a claim for anything.

1080. (*Earl of Romney.*) I think you spoke of certain places which are under private local Acts, and also are under the general local Act, and in that case many of the provisions under each of those Acts are sometimes conflicting and sometimes the same?—Undoubtedly.

1081. Then I think you suggested that in those cases it would be desirable if they were put entirely under the Public Act, and if the Local Act were superseded or got rid of?—I think so.

1082. In order to carry that out, would not the only way of doing it be by repealing the private Local Acts?—I should first make the general Act applicable to all towns, and where any local Acts were in force then those provisions that were sought to be retained should be retained by provisional order confirmed.

1083. Your object being to bring the town under the general law; if a private Act is in existence you can only get rid of that private Act by repealing it?—You can only get rid of it by repealing it.

1084. That would be a very expensive way and you would require another private Act to repeal that private Act?—No, it is not a very expensive way, for an inspector comes down from the Local Government Act Office and holds an inquiry, which takes place on the spot, as to whether it is desirable that any provisions of the local Act should be retained in force in the locality. If he finds it is desirable, he makes a report to the Home Office, and those things are scheduled to the Act which is passed, without any expense to the locality; it is a public Act.

1085. Then it is a public Act which repeals the provisions of the private Act?—Yes.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

Monday, 10th May 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.
The EARL of DUCIE.
The Right Hon. LORD ROBERT MONTAGU, M.P.
The Right Hon. STEPHEN CAVE, M.P.
Sir THOMAS WATSON. Bart., M.D., F.R.S.
Lieut.-Colonel EWART, R.E.
JOHN ROBINSON MCCLEAN, Esq., M.P.
JOHN TOMLINSON HIBBERT, Esq., M.P.
EVAN MATTHEW RICHARDS, Esq., M.P.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
JAMES PAGET, Esq., F.R.S.
HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
FRANCIS THOMAS BIRCHAM, Esq.

(5.) ARNOLD TAYLOR, Esq., further examined.

A. Taylor, Esq.

10 May 1869.

1086. (*Chairman.*) What is the general inference which you draw from the Wallasey case to which you referred in your previous examination?—The desirableness of every local board, should it apply to Parliament, being required to submit its bill first of all to the central authority for their previous approval.

1087. You fear that local boards having larger functions than ordinary local authorities, may obtain through the Local Government Act larger powers of rating than they ought to have?—Exactly so. You see how they got it in this case. Under the Local Government Act they could not borrow any money for the legitimate objects of that Act without the sanction of the Secretary of State; but they can now by going to Parliament borrow any amount of money they choose to raise. Under that Act, in the case of Wallasey, they have put the payment of their deficiency account upon the general district rate.

1088. We will now proceed to the next topic of your evidence. Can you give the Commission copies of Provisional Orders which will illustrate the various works that are effected under the system?—Yes, and other objects attained under the provisional order system, such as the alteration and repeal or partial repeal of Local Acts already in force.

1089. The powers of provisional orders under the Act of 1848 are extinct, are they not?—Yes.

1090. And the principal powers of provisional orders at present existing are under the sections of the Act of 1858?—Yes.

1091. But there are also powers of provisional orders under subsequent Acts?—Yes.

1092. Will you state the general scope of provisional orders?—The 75th section of the Act of 1858 enables local boards, under a confirming Act of Parliament, to put in force the compulsory powers of the Lands Clauses Consolidation Act, for purchasing lands or properties within their district.

1093. Is that by the process of a provisional order subsequently confirmed?—Yes. The remainder of the section provides for the manner in which that provisional order is asked for and granted by the Secretary of State upon inquiry. Then the 77th section of the Act of 1858 provides for the incorporation or the separation of districts, from local board districts; also for the alteration of local Acts already in force within local board districts, and for the alteration of any provisional orders or orders in council granted under the Public Health Act, 1848. The 78th section provides for the extension of borrowing powers of any district from one year's assessable value of the property of the district to two years. These are the three sections of the Act under which provisional orders are granted.

1094. And those powers are exercised under the powers of the Act of 1858, superseding similar powers given under the 141st section of the Act of 1848 which this section repeals?—Yes.

1095. Those are the provisional orders relating to the Local Government Act?—Yes.

1096. Exclusive of the Sanitary and Sewage Acts?—Yes, exclusive of them. I might, perhaps, add that the 19th section of the Local Government Amendment Act, 1861, allows the increased borrowing power to be applied for for all works, the Act of 1858 having limited it only to works of sewerage and water supply.

1097. Is it provisional orders of this kind that you offer us copies of in illustration of the various works they authorize?—Yes. I have selected a number, all offering some different point or another.

1098. Will you give us one or two instances of works that will best illustrate the question?—I will take the case of Bristol. The last order was given on the 20th of May 1868 for acquiring a great deal of property, which is scheduled for pulling down, and thereby widening and improving various streets in Bristol; that is a good illustration of a street improvement provisional order (*delivering in the same*). Then Great Malvern is another instance. There the Local Government Act is administered by the Improvement Commissioners, who have given to them, partly under the Local Government Act and partly under their Improvement Act, a great number of powers (*delivering in the same*).

1099. Do you mean the power of borrowing?—Powers for all purposes of local government and regulation of streets, and we have even embodied what is known as Bass's Act for the suppression of itinerant musicians.

1100. In the execution of those provisional orders I presume you have to take part, as inspector acting for the Secretary of State?—Yes.

1101. We will now proceed to your suggestions with reference to byelaws; you seem to suggest that a code of leading byelaws might be made applicable by general law to all towns?—I think so.

1102. Would it be something in the nature of a Towns Clauses Act?—Yes, something of that nature.

1103. Why do you think the present system of byelaws defective?—There is uncertainty, and their binding power is liable to be questioned; and very often local jealousy and jobbery render them a dead letter.

1104. Do you mean, by rendering them a dead letter, that the best byelaws are not made, or that when they are made they are inoperative?—Rather, that when made and confirmed by the Secretary of State, they are not put into practical operation.

1105. In what way would you suggest a code of byelaws which would escape this obstruction from jealousy and jobbery?—I do not know that my suggestion would be so effective in that way as in giving greater certainty to the law.

1106. Do you mean that there would be better laws, or that the laws would be more easily carried out?—A byelaw under statute would have greater force than now, when it is merely a byelaw of a local board, and it would be better law.

1107. In what sense would it be better law?—Because it would have more force. At present anybody can question a byelaw, and can interpose to prevent its being put into exercise.

1108. Do you think that a code of byelaws would be better law, or would it include the same laws, only with provisions for being better carried out?—The byelaws would be much the same, only they would have greater certainty; and being part of a statute, there would be less tendency to question their validity.

1109. Do you think that they would be less questioned and that the judicial authorities would pay more respect to them than to the other?—No doubt when they came before the judge they would. I hold very

A. Taylor, Esq.
10 May 1869.

much the opinion, which was expressed on the last day of the sitting of the Commission, by Mr. Norris, the town clerk of Halifax, on that point. I have brought with me and I put in a copy of the form of byelaws drawn up by the Home Office, which the local boards adopt with trifling modifications, according to local circumstances (*delivering in the same*).

1110. Can they adopt as much as they like?—Yes, but it is practically a body of byelaws upon which almost all local boards have framed theirs.

1111. You mean that most of the local boards have adopted the model of the Home Office which you put in?—Yes.

1112. What suggestion have you to make as to more direct communication between the district auditor and the Home Secretary?—I think certainly that every audit by a district auditor of a local board's accounts should be forwarded to the central authority as a matter of course.

1113. Would that be an annual report?—Yes, with any remarks made upon it that the auditor might think fit.

1114. Is not it your experience that such annual reports come in as a matter of form and are not much attended to?—No, they do not come in now.

1115. I mean similar reports?—I think that an auditor, sending such a report, would, if there were anything peculiar in the case, draw attention to it.

1116. As it is, is it not the fact that the Home Secretary only knows the facts of any misappropriation of rates by an appeal against surcharges by the auditor of the local board?—Yes, that is so. I referred in my previous reply to an abstract of the accounts, and to an auditor's report upon the accounts annually. I believe that there is something of the kind I have proposed already existing under the poor law audit system.

1117. The case you have already alluded to, Wallasey, could not have occurred if such a report had been made?—No.

1118. What suggestion have you to make as to the advisability of the extension of borrowing powers?—At present a local board, having borrowing powers up to one year's assessable value, borrows its loan, repayable by instalments in 30 years, and if it has an increase of borrowing powers up to two years' assessable value it has 50 years in which to repay its loan. I think, that for many objects for which local boards borrow money, they might in all cases have 50 years.

1119. Do you mean that they might have the larger power without applying to the Secretary of State?—Yes.

1120. What are the cases which you allude to in which such larger powers might be exercised?—I mean, generally, all those objects in which the work done or the improvement effected, would be of practically the same value at the end of the time of borrowing as it would be at the commencement.

1121. Would you give some instances of that?—I take first a class of cases which is on the increase; namely, the purchase of land for sewage irrigation. There the land no doubt would be even more valuable at the end of 50 years than at the time when it is first acquired.

1122. Both by the improvement by means of the sewage and possibly by the extension of buildings?—Yes, and from the general tendency of land in this country to rise in value. Then, again I take property bought to be pulled down, for street widening and improvement, the improvement is as good at the end of 50 years as at the commencement. Then, money borrowed for the erection of public buildings, such as offices, town halls, baths and washhouses, land bought for public parks and recreation grounds, and water rights and properties acquired for the purposes of water supply.

1123. Would it not be possible in some of the cases that you have referred to, such for instance as baths, washhouses, and so on, that at the end of the term they might have become useless, or some better situation might have been found for them?—Scarcely at the end of 50 years; a well-erected building would not be materially impaired in value by that time. In some cases the value would, I consider, be actually greater; wherever land is acquired, or water rights, I consider that these would be of absolutely more value.

1124. In alluding to sources of water supply, do you include waterworks and reservoirs?—Yes, I make the suggestion by way of lightening local burthens. I see by the tables 30 years at five per cent. entails an annual charge of 6*l.* 10*s.* 1¼*d.*, whilst for 50 years at five per cent. the annual charge is 5*l.* 9*s.* 6¾*d.*; so that it is about 1*l.* in the 100*l.* I am assuming that both loans are raised at five per cent.

1125. What would be the difference in the rate of interest, including the sinking fund, in the case of a loan of 30 years and 50 years?—Supposing the loan is raised at five per cent., 1*l.* per cent.

1126. Have you any suggestion to make as to the Local Government Act Office being made more self-supporting?—I think that it might be made completely self-supporting.

1127. How?—On the principle of charging, and making each place pay for the work done for it in the office.

1128. That would be merely covering its expenses as far as it relates to surveys of works?—No; I mean all the work done for towns in the office.

1129. Would you make the charges for work done cover all the expenses of the Local Government Act Office?—Yes I would; and it might be done at a very trifling cost to the different places.

1130. You have a suggestion to make, have you not, as to costs being charged on frivolous appellants?—Yes. I may say that the principle of repayable expenses is already admitted to a certain extent, and I would carry the principle further.

1131. How far would you carry it?—I would carry it to all work done in the office. At present, in all cases of a provisional order inquiry, the inspector's travelling and personal expenses are charged to and repaid by the district. I think that his time and the time of the other officials in the office occupied with the work of such provisional order should also be charged to the district. I may add that the secretary of the office has prepared a statement, which I believe is at the Home Office, showing the principle carried out in detail. (*See Appendix*, p. x.)

1132. The 81st section of the Local Government Act of 1858 provides that the orders of the Secretary of State shall be binding, and the secretary may make orders as to the costs of any appeals to him under the Act, and the parties by whom such costs shall be borne; would you alter that section?—I think that it should be carried further. I think it should include all the costs of the appeal connected with the office. It would have the effect of checking groundless appeals and frivolous complaints.

1133. Is Crown property exceptionally exempted from rating under this Act?—Not under the Act, but there is a general exemption of all Crown property from taxation, and in some cases it works with particular hardship and injustice.

1134. Is it your opinion that Crown property should pay the same as private property for sanitary works?—Yes, for the same class of property.

1135. Can you give us any instance which illustrates your suggestion?—It has been brought before me in consequence of an inquiry which I held in the township of East Dean, in the Forest of Dean. The whole Forest of Dean is Crown demesne, except such portions as have been sold, or have been alienated from time to time, by the Crown. The township of East Dean contains several inhabited centres, and my inquiry was chiefly directed to one called Cinderford, a place of about 5,000 people; I have seen no place in the course of my experience in a worse sanitary condition. There this exemption of the Crown property brings things to a dead lock, there being so little property to rate.

1136. With regard to the Sanitary and Sewage Acts, have you considered that those Acts generally

are too indefinite, both with regard to the construction and also the continuance of local sewer authorities?—I think so.

1137. Particularly with regard to rural districts?—My objection applies to all districts, because the difficulty of working is found wherever the Act is attempted to be put into operation.

1138. In what way would you make the provisions of those Acts more definite?—Generally, by assimilating the Act to the provisions of the Local Government Act, with regard to the formation of districts, and the formation of boards or committees, or whatever they may be called.

1139. In fact that the nomination, election, continuance, retirement, and qualification of the committee ought to be provided for in those Acts, as in the Local Government Acts?—Yes, I would do away with the idea of the vestry as the local authority.

1140. Why would you do away with the vestry?—Because the vestry is, in point of fact, nothing more than the ratepayers of the parish.

1141. If it is so what would you put in its place?—The responsibility should be upon the ratepayers, and I would put them in motion through the churchwardens or overseers, as is now done under the Local Government Act, and if there were no churchwarden or overseer, as in some districts there might be none, then, as under the Local Government Act, through an officer appointed by the Secretary of State on application to him from the district.

1142. What would be the difference between summoning the ratepayers and asking them to form a committee, and the vestry forming their own committee?—I would put the Act in motion by some machinery of this kind, which again is that of the Local Government Act, the requisition of a small number of ratepayers, five in very small districts or ten in larger ones. They should make a requisition upon the churchwarden, or the overseer, or the summoning officer appointed by the Secretary of State to call a meeting of the ratepayers to put the Sanitary Act in operation; that is the mode of working under the Local Government Act.

1143. In fact the ultimate committee would be the same in both cases, but by the plan which you propose you think that the Act would be set in motion more efficiently?—Yes, certainly more efficiently. At present a vestry is anything or nothing. Three people attend and make a vestry, or 300 may make one.

1144. The vestry, I think, is in the schedule of the Sanitary Act, the local authority for a rural district?—It is both the Sewer Authority under the Sewage Act and the Local Authority under the Act of 1866.

1145. What suggestion have you to make as to special drainage districts?—I think that no special drainage district should be formed without the previous sanction of the Secretary of State.

1146. Why so?—Because at present the formation of the district, being left entirely to the discretion of the vestry, such districts are often formed of a very objectionable character. They are far too limited in size for one thing.

1147. Do you think that the Secretary of State sending down his inspector would probably form better districts?—I think so. No new district can be formed under the Local Government Act except after inquiry, and I would extend the same principle to the Sanitary and Sewage Acts.

1148. By your Abstract B of your inquiries as inspector, which you have put in in evidence, does not it appear that in a great number of cases the Sanitary and Sewage Acts have been a dead letter?—Yes, in an immense number of cases the Acts are not worked. Theoretically they are in force everywhere, but practically they are a dead letter in a great number of cases.

1149. You are now speaking, are you not, chiefly of rural districts?—Yes; my remarks generally with respect to the Sanitary and Sewage Acts refer to their application to rural or semi-rural districts.

1150. I presume that rural districts, generally speaking, are more backward than towns, although sanitary measures are more wanted in them than in towns?—Yes, that is my experience.

1151. Is it your opinion that in a great many villages throughout England people drink water which is polluted?—Yes, I am sorry to say that that conviction has been forced upon me by inquiries which I have held in villages.

1152. Will you mention some cases of that sort that you know of?—I would give as instances the village of Wouldham on the Medway, near Rochester, the village of Hill Morton, near Rugby, Chulmleigh in North Devon, Epping in Essex, and Bromyard in Herefordshire. I should think that Wouldham, the village itself, speaking roughly, may have a population of from 1,200 to 1,500: at Hill Morton, through the exertions of the Rev. Charles Darwell, sanitary works, will shortly be in operation, the committee of the vestry having complied with the Secretary of State's order.

1153. Do you think that the law is a dead letter amongst those villages, sometimes from the village being of too small an area to carry out the Act?—I think it is more from apathy and from an idea that it is a great absurdity to have anything like works of sewerage and water supply in a village.

1154. Do you think that more powers are wanted either to unite or even to compel the union of country parishes for larger purposes than one single village can carry out?—I think it would be desirable if there were such powers of union.

1155. Would that be by an extension of the provisional order system?—I think that that would be a convenient mode of effecting it.

1156. In fact, to make the provisional order system now existing in towns extended to rural districts?—It is extended for some purposes, and I would extend it for the union of districts. Under the Sewage Act of 1867 there is a permissive power for the union of districts, for the purpose of sewage outfall. Under provisional order, I would, in certain cases make the permissive power compulsory for other purposes as well, particularly for water supply.

1157. Will you state what is the existing provisional order system with regard to rural districts under the Sanitary and Sewage Acts?—Under the Sanitary and Sewage Acts the provisional order system—upon precisely the same principle as that laid down in the Act of 1858—is extended to places under the Sanitary and Sewage Acts, for the purpose of sewage outfall and disposal only.

1158. Is that the only purpose?—That is all.

1159. Would you extend the byelaw system upon any points to rural districts?—I think that some few leading byelaws, with regard to the construction of houses and their position, so as to give them the means of drainage into a sewer, would be very desirable.

1160. What would you say as to the audit of accounts?—I would extend the same supervision by the auditor, to districts under the Sanitary Acts, as to local board districts under the Local Government Act.

1161. What is your opinion as to the power of complaint given under the 49th section of the Sanitary Act?—I think that it needs restriction. A complaint can now be made by a single person on the slightest grounds, and I think that the complaint ought to be supported by at least one-tenth of the ratepayers concerned, either in number or rateable value; in that way you would ensure a certain amount of local support to and interest in the complaint.

1162. Do you give that opinion as the result of your experience as to the working of the 49th section?—I do.

1163. What is the power of the office under the Sanitary and Sewage Acts to charge any expenses in a district?—It has no power, even for the identical objects for which charges are made by the office under the Local Government Act.

1164. And you think it should have similar power?—I think so.

A. Taylor, Esq.
10 May 1869.

1165. Is there no provision for defraying the preliminary expenses that are incidental to the Act?—There is no provision, and that is often a difficulty in places where they have to recover the expenses they may have incurred in first setting the Act in motion.

1166. And what do you say with regard to the Secretary of State charging the costs of appeals?—I think that the same power should be given him in that respect as is given under the Local Government Act.

1167. In all those points you think that the Sanitary and Sewage Acts are defective, and that they ought to be supplied with similar powers to those which are given under the Local Government Act?—I think so; and I would extend the powers of the inspectors as well. At present we have not the same power under the Sanitary Acts as we have under the Local Government Act, and if an inspector holds an inquiry he has no power to command the production of papers or plans as he has under section 80 of the Local Government Act, nor has he the power of summoning witnesses.

1168. Is there still a conflict of duties between the local and the nuisance authorities?—There is a very great conflict. I would just refer to sections 22 to 34 of the Sanitary Act of 1866, which give various powers to the nuisance authorities for controlling hospitals, the bedding of hospitals, and the conveyance of patients. And again to section 37, which imposes upon the local authority the duty of erecting the hospital itself. I have heard a difficulty raised in districts as to what is a hospital; is it an empty building with so many rooms, or is it a building properly equipped with beds and bedding, and conveniences for patients. I know that that question arose in the Isle of Wight.

1169. Are you aware that there is a water supply bill now before the House of Commons?—Yes, by accident I saw that there was a bill with the names of Mr. Biddulph, Colonel Stuart, and the Marquis of Lorne on the back of it.

1170. Does not that propose new local authorities?—I am not very certain about it, but it appears to do so by section 10. The local authority is there proposed to be the churchwardens and overseers with the consent of the vestry.

1171. So that if that bill passed into an Act instead of simplifying the law it would increase the confusion?—Yes, there would be another element of confusion introduced. And since I was examined on the last occasion my attention has been drawn to the Petroleum Act, which makes the town council in a borough and the commissioners under a Local Improvement Act, where such is in force, the local authority. In harbours, everywhere, the harbour authority is the authority. But, in all other places the justices in petty sessions are the local authority, so that a local board, in a purely local board district, has no authority to work the Petroleum Act.

1172. I may ask you generally, whether you entertain the same views as to the advisability of an intermediate authority between the central and the local authorities, as were expressed by your brother at the head of the Local Government Act Office?—I do.

1173. That the area of such intermediate authority should be a county?—I think so; or subdivisions or unions of counties, according to their size, population, and trade.

1174. Do you think that such intermediate authority should have power over all the local boards and all local authorities within that district in respect to water supply, works of sewerage, sewage outfall and disposal, and the enforcement of the Nuisances Removal Act?—Yes.

1175. And as to the smoke nuisance, and overcrowding of dwellings?—Yes, and as to dwellings unfit for human habitation, and the neglect of scavenging and privy accommodation, and the enforcement of byelaws.

1176. How would you get rid of the present conflict between the local and the nuisance authorities?—I would rather see both duties centred in the local authority, withdrawing the control now exercised by the boards of guardians as a nuisance authority, and transferring such nuisance authority to the district boards.

1177. By district board you mean your suggested intermediate authority?—Yes.

1178. What sort of number do you think that that intermediate authority ought to consist of?—I offer my opinion with very great hesitation, because I know that it is opposed to public opinion on such matters; but in my idea the board should be a very small one. It should be composed of three or five members—gentlemen specially qualified, giving their whole time to the work, and appointed directly by the Government and paid by the Government.

1179. Do you think that such a small body of paid officers might be the officers of a larger body, such as the quarter sessions or a committee of the quarter sessions?—I would rather see the governing body and the executive body in one.

1180. Are you referring now to rural districts, or would you include towns in this suggestion?—I would put all places under the control of such a board as I suggest.

1181. Not such large towns as Manchester, for instance?—If there were any need for interference. The district board would only interfere where it was rendered necessary by the neglect of the local authority.

1182. How would you propose to defray the cost of such a district board?—I would defray the cost of the district board and its officers out of the local taxation of the district over which it had authority; the board to account for its expenditure either to the proposed county financial boards, or to the central authority.

1183. The supreme central authority you propose still to be the Secretary of State for the Home Department?—Yes.

1184. Why do you object to unpaid members elected by the localities?—I think that a district board elected by the locality would but reflect in a greater or less degree the apathy or the reluctance of the ratepayers, or the local authorities that appointed it. The great point is, to ensure prompt and direct action by an intermediate body, free from local prejudice or partiality.

1185. Would you give such a board control, not only over sanitary matters, but over such large questions for instance as the rivers pollution?—I would.

1186. Would you give them the supervision of large areas for agricultural and land drainage?—I would.

1187. Then would you propose that the supreme central authority should still reserve its right of inquiry when it pleased?—Yes, and I would also give in all cases the power of appeal from the district board by the local authority to the central authority.

1188. (*Earl of Ducie.*) You stated as your opinion that you think that Crown property should be rated in the same manner as private property for sanitary purposes?—Yes.

1189. You mentioned the case of Cinderford; will you state in what way the existence of Crown property at Cinderford has acted adversely to the interests of the locality in a sanitary point of view?—From the fact of the whole land in East Dean having been originally Crown property, the local board are prevented from having the ordinary control over what are there called, by courtesy, the roads. They have no right to take possession of these as in any other district, either for their repair or maintenance. And again, the property of the Crown being exempt from rating, the local board have so small a basis upon which to borrow money.

1190. And would that be simply remedied by rating the Crown property in the same way as private property?—In a great degree. At Cinderford the local authorities would have a further very strong claim, I think, on the Crown to make good the consequences of past neglect, as well as to contribute to the local

taxation, the Crown property being rated like any other.

1191. In a letter from a gentleman in that district, he seems to imply that there is a great deal more than the mere bad state of the roads, for he says that he cannot imagine anything worse to exist in the kingdom or in any heathen village in Africa, and that it is a disgrace to the community; do you agree with that?—I have seen no place in England in a worse condition than Cinderford, and I have also seen many native villages in South Africa but none so bad as Cinderford.

1192. (*Mr. Hibbert.*) You stated that most local boards had adopted the model byelaws suggested by the Home Office; do the large towns under the Local Government Act, or any towns which have applied to Parliament for Improvement Acts, generally adopt those byelaws, or do they seek to obtain wider powers than they would get by the byelaws?—In some few cases within the last two sessions they have obtained power to embody certain byelaws in their Local Improvement Act. Halifax has done so, and I believe Oldham also, and I heard from Mr. Norris's evidence on Thursday that Keighley is doing the same.

1193. In those cases have they adopted the same byelaws which are recommended by the Home Office, or do they adopt different ones?—My knowledge is confined to Halifax, and the byelaws embodied in the Halifax local Act were nearly the same as ours, with some few additions.

1194. Would not it be the case if you were to enact byelaws in a statute, that if a town found that there was a wish for better byelaws than those which are enacted in the statute, there might be a difficulty, unless they went to Parliament specially to have improved byelaws for that special place?—I think you have now got such an amount of experience with regard to the working of byelaws that you might draw up a code with regard to certain leading points that would stand and would not require alteration.

1195. Still byelaws are not by any means perfect?—No, not at all. I am supposing that certain leading byelaws will be embodied in a statute, as to street construction, for instance, and the structure of houses, the stability of the structure, and the position of the house, and with regard to its means of drainage into a sewer.

1196. Is there anything in the byelaws suggested by the Home Office with respect to the size of the rooms of houses to be built in different places?—No; they only provide for ventilation.

1197. Are you aware that in the Manchester Improvement Bill, now before a Committee of the House of Commons, they introduce byelaws with respect to the size of rooms?—I do not know that.

1198. With respect to the working of the Sanitary and Sewage Acts in rural districts, I understand you to say that you would do away with the vestry, and that you would give the power, on the requisition of a certain number of ratepayers, to call upon the churchwardens to summon the vestry and to consider the question of putting the Act into operation?—To call a meeting of the ratepayers.

1199. Would not it be better that the Act after passing should apply to all districts at once?—I would consider it everywhere in operation. I would make it as general as it is now, but I assume there must be some action of the district to put it in operation to set it going.

1200. When you use the words "put it in operation" what do you exactly mean?—I should have said to set it in motion.

1201. With respect to the Local Government Act, would you make it compulsory in large towns above a certain population?—No, I would let them have it as they have at present. I would allow them to adopt it.

1202. Is it not the fact that there are several large towns in the country with populations above 10,000 which have not yet adopted the Local Government Act?—Yes, some of the largest have not.

1203. Are there not several large towns which are neither under any Improvement Act nor under any local authority whatever?—There must be several. *A. Taylor, Esq.* 10 May 1869.

1204. Would not it be desirable in a town where the population exceeds 10,000 or 12,000 that it should be compelled to adopt the Act?—I think it would be very desirable, if the Local Government Act were declared to be in operation in all towns above a certain size, and, in the same way, the Sanitary and Sewage Acts in districts with less population.

1205. Might it not be advantageous to apply the Local Government Act to large towns and make it compulsory in all towns above a certain size, and to apply the other Act which you suggest, which would include the Sanitary and Sewage Acts and other similar powers of the Local Government Act, to all towns under that population?—There is this difficulty, when you take population as a basis, that you may have a township or parish of the population you speak of, say 10,000, but no town in the ordinary sense of the word, of anything like that population.

1206. That is to say, you mean that the population may not be brought together into a small area?—No, you might have a large parish with scattered inhabited centres as I call them for want of a better name.

1207. Do you know the case of Ulverstone in the north of England?—Yes.

1208. Do you remember that that is a crowded population?—Yes.

1209. It is only within two or three years that the Local Government Act was adopted in that town, I believe?—They did not adopt the Local Government Act, they have gone to work under the Sanitary Act, but theirs was a case in which they certainly should have had the Local Government Act.

1210. They refused to adopt the Local Government Act, did they not?—Some of the ratepayers wished it, but the majority was against it, and they have borrowed money and are carrying out their sewerage works as a sewer and local authority under the Sanitary and Sewage Acts.

1211. Was not the health of that district in a very bad state during the whole of the time that they were discussing the adoption of the Local Government Act?—It is alleged to have been so, and I adopted that view in my report to the Secretary of State, and the ratepayers of Ulverstone were very indignant with me for doing so; they considered that it was very healthy. I have no knowledge personally of the mortality.

1212. Have you considered at all what you would make the governing body of a country parish or township, in place of the vestry, and would you propose to put the whole governing power of the parish or township in that body?—I would have them do what a district does now under the Local Government Act. There might be an election, preserving the name, if you like for distinction, of a district committee, elected for a definite period, with a rotation of retiring members, and a qualification for each member proposed, in fact the same provisions as there are under the Local Government Act for the election of local boards.

1213. Would not it be better to give that body the control of the roads in that particular parish or township?—There is this difficulty; my experience in country districts is everywhere the same, that the farmers as a body are opposed to all sanitary measures, and the one thing with which they concern themselves is the state of the roads, and if you get a committee with a certain amount of representation of the farmers interested in the district in which the works are to be done, you will find them always opposed to the construction of works, and only troubling themselves with the maintenance of the roads and keeping them up at the lowest possible expense. I would rather suggest that the road jurisdiction should not come under the committee.

A. Taylor, Esq.
10 May 1869.

1214. Then you would still have two different bodies in the same parish; you would have the surveyor of highways actually controlling the roads, and you would have another body controlling the sewers, the water supply, and the works?—Yes; not from any wish to see two bodies, but from my experience of what very bad sanitary reformers farmers are.

1215. Would not it be more likely that the body that you propose to elect to carry out the sanitary powers of the parish being men of higher standing, would be likely to pay greater attention to the roads than the farmers would?—I am assuming that in a greater number of cases the committee would have formed or have had formed for them by the central authority a small district cut out of a large country parish, such a committee would have no right of jurisdiction over the roads in the rest of the parish, and that is constantly happening.

1216. With respect to the intermediate authority which you have mentioned, do you mean by that authority a county area or some less area?—I think the county may be taken as the unit, but as counties vary in size and in population there should be the power of subdividing, or in some cases of combining counties, but I take the county as an existing division, as nearly all our other territorial divisions are formed with reference to the boundaries of counties.

1217. (*Lieut.-Col. Ewart.*) If you had such an authority as you have just mentioned, would you vest in that authority the decision as to borrowing powers, which is now exercised by the central office?—No; I propose that the powers now exercised by the central authority should still remain.

1218. Would you propose any system for the inspection of the works which are done with borrowed money, either when they are in progress or when they are completed?—A very large number of the works done under the powers of the Local Government Act when completed are covered up, and I do not think it desirable in any case that the central authority should take the responsibility of these works. I think it is much better left with the district itself. The district should apply to the central authority for sanction to borrow, but the responsibility of execution should rest with the district itself.

1219. If you had an intermediate authority, would you give them any powers of inspection?—If the district chose to ask for them; I have not considered that case but I think it is better as a rule to let people be responsible for the outlay of their own money.

1220. Has it come under your observation that a great deal of bad or useless work has been done for want of proper direction in towns?—No, I have not had any cases of that kind brought under my own notice, there may be such, but they have not been brought under my notice.

1221. Do not you think it very important that the control of waterworks should be vested in the same authority that has the control of sewer works?—Yes, I think I mentioned that the intermediate authority should certainly have the control of waterworks, and it was an omission on my part if I did not specify waterworks.

1222. At present there is no power unless they agree upon both sides for two places to combine for local purposes, what is your opinion upon that?—I think it is most essential, in the present state of things, that there should be the power of compelling unions of districts. There is a permissive power, but it is a dead letter at present, because it is only permissive, there should be the power of compulsory union, and it could be very simply done under the present provisional order system by allowing any one or more districts to petition the Secretary of State to form a union of districts upon inquiry, all the other districts having been served with notices, and then that provisional order would go to Parliament and if necessary there would be an appeal to a committee of the House of Commons against the provisions of the order.

1223. (*Dr. Acland.*) You mentioned instances of cases where you found bad water supply and other sanitary evils: how did those places come to your knowledge, speaking more particularly of rural districts?—Generally I think by complaint under the 49th section, but the complaint had not always been of the water. Since the Rivers Pollution Commission was formed we have been allowed to send samples of water whenever we think necessary to the laboratory for analysis, and in that way the office has been able to have the services, in the first instance, of Professor Way, and subsequently of Professor Frankland, to give us the results of their analyses, and that has been found of the very greatest use.

1224. You have stated, and it has been stated by others, that the Act gives powers, but the powers are not called into operation by the public bodies; you have however been called to inspect by individuals, have you not, under the 49th section?—A complaint is alleged against the local authority of default and an inspector is sent down, when he is once there, he may inquire, as I have generally assumed power to inquire, into more matters than the particular complaint upon which he is sent down and in that way we have got information about the well waters.

1225. We have had evidence as to the action of the Privy Council in this matter, is it more proper to send to the Local Government Act Office or to the Medical Officer of the Privy Council for such inspection?—I must stand up for my own department. It must be a matter of opinion. I am hardly competent to answer.

1226. Which has the greater power of executing?—The power is with us certainly, because we have power under the compulsory sections of the Sanitary Acts.

1227. Is it not so that the Privy Council may nevertheless send an inspector also and do send him?—They do send inspectors.

1228. That is for necessarily sanitary purposes but not with regard to the Sanitary Act?—In two cases I have been associated with the medical inspector of the Medical Department of the Privy Council, once at Terling, where the Secretary of State's powers were called for by the Medical Department itself, and in another case in the north of England, a village called Cockfield near Barnard Castle. In both those cases the medical inspector rather dealt with the nuisance authority than with the local authority.

1229. You must have certainly been in contact with the guardians as *de facto* a sanitary authority, and it must have struck you that in every rural district throughout the country there is at this moment a Government medical officer, that is to say, the Union medical officer?—Yes.

1230. Do not you find that by that system you may practically obtain much of the information that you want as to the health of the district?—I suppose it could be got from them. I do not know that it is so.

1231. Could not the Commission at this moment without applying at your office or to the Privy Council get information by return of post as to the sanitary condition of any village in the kingdom through the Poor Law Board from the existing Union medical officers?—No doubt theoretically they ought to be in possession of that information, but in wide lying rural districts I doubt whether they would have that information without they were specially told to get it.

1232. I think your previous answers would imply that the way to meet that difficulty would be to combine several parishes into large districts under skilled supervision?—From what I have seen I do not think that the board of guardians in a rural district makes a very good nuisance authority. Guardians as a general rule do not recognize the enforcement of the Nuisances Removal Acts as one of their functions; they think they are elected for the purpose of poor relief, and not for maintaining or looking after the health of the district.

1233. But yet practically under some Acts they have certain powers of that kind, have they not?—Yes; they have the powers, but they do not exercise them.

1234. Could you make them exercise them by the system of well ordered central inspection, or would you have the inspection carried on by a county or district authority?—That inspection would be through the district authority, and not through the guardians at all.

1235. You mentioned that there were reports on these subjects sent in regularly to the Poor Law Board; is that the case to any extent?—I do not think I said so. It was on the subject of the auditor checking the accounts of local boards, that I said I believed there was a system of that kind under the Poor Law Board.

1236. You do not know whether in any other respects they have reports except from their inspectors when they send them down?—I do not know whether they have or not; I am not informed on that point.

1237. (*Mr. Bircham.*) Do I understand that you would continue in the rural district the parish as a unit?—I would continue the parish, allowing a special drainage district to be formed out of it, if necessary, but the formation of such special drainage district to be first approved by the Secretary of State.

1238. But by whom would you suggest that it should be initiated?—By a requisition of a small number of ratepayers, say in places under 500 population on the requisition of five ratepayers, and above 500 ten, and so on; that they should call upon the churchwarden to summon a public meeting for the purpose of putting the Act in operation, and appointing a committee for the purpose, by a regular election by voting papers.

1239. Do you think it would be a bad arrangement that parishes should be grouped into unions forming together a population of from 12,000 to 20,000?—I am afraid it would be difficult to get anything like common feeling in parishes so grouped for the purposes of local government.

1240. Have we not the same sort of result brought about in the case of the Poor Law?—Yes; the country is familiar with that, but I am afraid it would resent any such union for sanitary improvements.

1241. There was a time when the country was not familiar with that principle in connexion with the Poor Law?—Just so; and I have been rather considering what would work well at once.

1242. If you leave small parishes to conduct their own health affairs separately, would you be able to find the proper officers within the parish?—They must find them themselves. My proposed district authority would see that smaller places were getting to work and putting the Act in operation.

1243. Then you would by that system create a clerk or secretary, and a health and possibly other officers, and in every parish taking interest in such matters?—No, I do not assume that at all; I believe, as a rule, a village wants four things: a wholesome supply of water; a system of sewerage and house drainage, so as to get away house slops and refuse; decent and sufficient privy accommodation; and the systematic removal of offensive refuse from the neighbourhood of houses.

1244. Agreeing with you as to what may be wanted as a result, I am looking more to the machinery by which that result is to be effected, and the difficulty of effecting this if each parish acts by itself?—I would give power where convenient for parishes to form unions under certain circumstances for common objects.

1245. At present there is the power of union, but it must be initiated by every parish seeking to come into the union joining in the application to the Secretary of State for forming it?—Yes; and it is a union confined to one thing, namely, sewage outfall; it is for no other purposes.

1246. As far as the Act gives you any example of it at present, it must be initiated by the consent of every authority proposed to come into the union?—Yes, the Act was passed in 1867, and there have been two cases, I think, as yet in which those permissive powers have been put in force—one at Falmouth, where the borough of Falmouth and the district of the local board are mixed up together, the borough occupying a certain portion of the town and the local board having the remainder of the parish, or about two-thirds of the town, the remaining one-third being in a distinct parish which would not combine, the other example is that a union of districts at Brackley, in Northamptonshire.

1247. Have you at all considered whether there might not be a compulsory formation of districts throughout the country for purposes of roads, and nuisance and health somewhat of the size of poor law unions?—If you could get such carried out it would be very desirable.

1248. Can you tell me what was the history of the 49th section of the Sanitary Act of 1866; why it came to be added to the code?—No, I do not know that; I do not know anything about the circumstances under which that Act was passed.

1249. Am I right in assuming that previous to the enactment of that 49th section of the Act of 1866, there was no authority in the Secretary of State or any outside authority to compel the execution of works?—Previous to that Act there was none.

1250. Neither in towns nor in the country?—No.

1251. Have you had experience of the difficulty arising, because the sewer authorities have no sufficient power over the roads in districts in case they desire to make sewers?—Yes, I have had instances of that kind, but I think more frequent instances of the evil arising from the existing sewers not being vested in the local authority.

1252. That is probably an oversight in the Act?—Yes.

1253. It appears, does it not, that the sewer authority has the power now of putting sewers into public roads?—Yes, it has the same powers as a local board.

1254. Therefore the difficulty is, that the roads and sewers are in different hands, the roads being in the hands of the surveyor and the sewer authority having the authority for making the sewers.—Yes.

1255. Have you had any experience of cases where it has been desirable to get rid of water by drains as distinguished from sewers in any rural district for the purposes of health?—No, I have not had any instance of that kind; nor would it come before us I think, that is why I say that land drainage ought to come under the district board.

1256. Has it come under your observation that at present every owner has a compulsory right of joining, for sewage purposes, any sewer formed by the sewer authority?—Yes, he has the right, I believe, under the Act of 1867.

1257. And therefore, with their present powers, the sewer authority has no power of making a drain for pure water purposes and preserving it from invasion by the owners adjoining it putting their sewage into it?—I suppose if they made a sewer in the ordinary sense of the word an owner might put his sewage into it.

1258. They have no power to make a water drain as distinct from a sewage drain?—No, not a pure water drain.

1259. Do you think it would be desirable that individuals should in any case on the approval of some central authority acquire a compulsory right of outfall for sewage purposes?—I think it better that any such right should only be conferred on the local authority or the sewer authority.

1260. The power to prevent overcrowding in rural districts is very necessary, is it not?—Yes, it is very much wanted.

1261. And it is very limited at present?—Very limited. I should not think such a thing was ever enforced.

1262. There is only authority in one of the Nuisance Acts?—Yes, there is the power in the Sanitary Act of 1867, but I should think it is never used.

1263. Have you had any experience of mischief to health arising from houses being erected and

A. Taylor, Esq.
10 May 1869.

inhabited before they are fit, because they may be unfitted for habitation?—No, I have not had any special instances of that kind before me. I may say as a rule, that in any of my inspections I always, as far as possible, keep clear of what may be considered medical questions, the causes of disease, and so on.

1264. In the case of water supply you cannot compel owners or occupiers to provide themselves with water in a rural district?—No; and that appears to be the object of Mr. Biddulph's bill.

1265. Do you think that in any sanitary code it would be desirable that jurisdiction for enforcing the provision of a proper water supply in the case of unwholesome water or no water at all should be extended to rural districts?—I would give the same power for small districts as for local board districts; it is just as much needed.

1266. You said something about the improvement of audit in the case of expenditure by sewer authorities; there is no statutory provision for audit at all, is there?—I say that I would have them put under an audit, the same as local boards.

1267. (*Mr. Richards.*) Do I understand you to say that you think it would be desirable to have a code applicable to rural districts, and a code applicable to town districts, enacted by statute?—Yes; I would make the Sanitary Act different to the Local Government Act, for instance.

1268. You would, in fact, have two enactments—one applicable to rural districts, and another to town districts?—Yes.

1269. Where would you draw the line—by population, or in what manner?—There would be great difficulty, for the reason I have stated, that if you took the population of the parish it would often be no guide to the population of the town. You might have a parish with 15,000 people, and no town in it of more than 5,000, or perhaps less.

1270. How would you define a rural district?—It is very difficult, I say, to define it.

1271. You are familiar, by holding inquiries, with Mountain Ash?—Yes.

1272. There would be great difficulty, would there not, in defining rural districts and town districts in a case of that description?—Yes, there would be difficulty.

1273. Do you think that it would be practically possible for an inspector upon inquiry to define what should be a rural district and what should be a town district?—I think it might be pretty well arrived at by local inquiry. If such were made a subject of local inquiry I think it might be defined, but I have not contemplated that as one of the subjects of local inquiry.

1274. Assuming that the statutes were codified, do you think that it would be possible by local inquiry for the inspector to make certain recommendations as to what portions of the Act should be enforced, and that a provisional order should then define what clauses of the Act should come into operation?—I think I would make the Act of general application; the Local Government Act to large places and the Sanitary Act to small places.

1275. I think you heard Mr. Norris's evidence on Friday. Do you agree with Mr. Norris that the provisions usually contained in byelaws could usefully be made direct enactments?—I do. I speak now of some of the leading byelaws.

1276. Would you make any byelaws direct enactments for rural districts applicable to the drainage of houses, and to the necessity for plans being sanctioned by a board previous to building?—I think it would be very desirable even in rural districts, if the builder were required to produce plans to some authority before he was allowed to build any house, and to show that there was provision for drainage.

1277. Would that embrace the question of water supply?—Yes.

1278. In answer to a question of Mr. Hibbert, I understood you to say that you would give an inspector the power to report upon the union of districts. Assuming that two parishes refuse to join together and the Secretary of State's order is not made compulsory, how would you carry out the works for that district?—There my intermediate authority would come in.

1279. Suppose the intermediate authority were the county area, and that that one parish was out of the county?—I consider that small district boards directly appointed and doing nothing else would be always acting tolerably in common, and this would not be the case with an elective board.

1280. Does not your last answer rather preclude the possibility of a county board being effectual, the area of counties not exactly covering what may be necessary?—No, if the proposed union overran the county boundary, the two authorities would have to settle where to compel the common action.

1281. And your opinion is that your district authority should not be in all cases conterminous with the county authority?—No, I would take the county as the unit, and you might in very small counties have more than one county in a district, and in very large counties you would want subdivisions. Take for instance Lancashire and Yorkshire, and compare them with small rural counties. Large counties would want subdividing, and small ones might want grouping.

1282. You would not draw a hard and fast line, so to speak, and say that it should be a county authority?—Not at all. I assume a county or unions of counties or subdivisions of counties according to the circumstances of each.

1283. Would you give that authority power to construct works in default of the parishes or the units not doing their duty?—I would give them compulsory powers to carry out works.

1284. And to raise money?—Yes; I think they might do efficiently all that the Secretary of State is now required to do under the Act, and which he cannot do.

1285. Why cannot he do it?—Because it is too much to ask one central authority to be taking upon himself the duties of rate collector, and engineer, and contractor, and all the rest of it.

1286. Do you think that if facilities for obtaining money to carry out works were increased local authorities would be very much more willing to do what is necessary?—I think it would be the greatest assistance. I know at the present time that the small local authorities are very much hampered by the difficulty of borrowing money for their works, and if there were any government department which would lend money at a given rate of interest upon the security of the rates it would be a very material assistance in getting works done.

1287. Do you think that provisions somewhat analogous to those given to the manufacturing districts would be applicable?—Something of that sort, I think, would be very desirable.

1288. (*Mr. Powell.*) In answer to I think two members of this Commission you stated that you would supersede byelaws on what you describe as leading subjects by a code forming part of a statute, do you recommend that there should be still certain byelaws, or would you leave each case to be dealt with on its own merits by the local authorities upon a point which you would not include in your definition of a leading subject?—I propose that they should settle their own byelaws for minor matters.

1289. So that then the matter comes to this, that you would narrow the scope of the present byelaws and increase the scope of permanent legislation?—Yes.

1290. You made some remark respecting carving a district out of a parish; did you, when you made that remark, have in mind some dense population within a large district, such as the population that might cluster around a mill or an extensive mining undertaking, or what had you in mind when you made that observation?—I was speaking generally of what is done in the large majority of cases, if the Sanitary Act is put in force at all, it is applied to a village

in a parish; very often, in fact generally, the parish has an area much larger than that to which there is any necessity for applying the Sanitary Act because it is rural in its character.

1291. Your answer would cover the case which is somewhat frequent in Yorkshire where you have a large parish or a large township and some part of the parish or township may be even on a moor, but another portion of it may be the seat of an active industry and of a dense population?—Yes. I may add here that the carving out of special drainage districts is carried on to a very mischievous extent, I think. I may give an instance of a place close to us. The parish of Merton immediately to the south of Wimbledon on the South-western line, which is a very small parish, has made itself into two special drainage districts, each with its committee. I do not know what works they have done, or if they have done any, but there can be no earthly reason why Merton should have two local authorities within it, though we have no power to prevent it.

1292. Do you not think that if you laid the whole of the financial burthen upon the localities you would increase that resistance which certainly now exists to the action of a central authority?—It would fall very light.

1293. You have some acquaintance with Chichester, have you not?—I have.

1294. I have before me the report of the finance and general purposes committee presented to the town council, and which on the 29th of April was adopted by the town council with one dissentient voice. That I think has been sent to the Local Government Act Office as the official answer of the Chichester town council to you as a Government office?—I read it this morning, and after reading it I expressed a hope that it might be put in and laid before the Commission, together with the reports which are alluded to throughout it, namely, Dr. Seaton's and my own.

1295. I find it stated in the report to which I have made reference, that the city is so clean a city that no complaint exists; they deny that the sanitary condition is bad, they state that immense efforts have been made and are being made towards sanitary improvements, and then they go on to say, "Instead of receiving encouragement and assistance from the officials of the Imperial Government, they are continually hampered and annoyed by unnecessary and trouble-some interference." It being therefore evident from this report that there is some collision between the Local Government Office and the authorities at Chichester, could you very briefly give the Commission some facts respecting that community, and the condition of affairs there?—The first interference with Chichester was by the medical department of the Privy Council, who sent down Dr. Seaton, and he made a report which is alluded to in that memorial. The corporation called for plans of water supply and sewerage from Mr. Lawson, the civil engineer, and did nothing more. In October 1866 there was a very influential memorial from the city of Chichester, complaining under the 49th section of the Sanitary Act, which had been passed in the August previous, of default by the town council of Chichester in carrying out proper sewerage and water supply. I held an inquiry under that complaint and made a report upon it. At that time the corporation seemed disposed to do something, but having got an Act of Parliament to remove the cattle market from the streets and form a new market, they have done nothing more except call upon Mr. Hawksley, the engineer, to give them a report upon the water supply and sewerage. Mr. Hawksley reported in favour of a water supply, but recommended them to pause in carrying out any system of sewerage. Within the last two or three months the medical department of the Privy Council, having again called the attention of the Secretary of State to the fact that nothing is being done, the latter addressed a letter to the town council, and the memorial to which you allude is the answer to his last letter of remonstrance.

1296. In that report they deny that the sanitary condition is bad; is it not true that they have cesspools and wells from which the people drink in very close contiguity in very many cases, and the strata are porous?—Yes.

1297. Have you not reason to suppose that, owing to the conditions which I have just described, the water in those wells is in a state which is most pestilential?—I think there is every reason to believe so.

1298. Have you not from what occurred when you were at Chichester reason to suppose that considerable pressure is being put upon certain inhabitants in order to prevent them making complaints and exposing the real condition of affairs?—I think that is very likely.

1299. In this town, which is stated by the local authorities not to be in a bad sanitary condition, is there not held a market every alternate Wednesday in the public streets, the number of animals often amounting to 10,000, and on one market day to more than 15,000?—Such is the case, but they are now building a new market outside the town.

1300. You may judge, may you not, of the state of public feeling in that locality upon sanitary matters by the fact that while this market still continues they deny that the sanitary condition is bad?—Yes, just so.

1301. Are you intending to apply the 49th section of the Sanitary Act of 1866 to Chichester?—I cannot say. I consider that it is a case for compulsory interference.

1302. And they have at present no source of water for drinking except the wells which have been alluded to?—No, and no sewerage whatever; they have nothing but cesspools.

1303. (*Mr. Shaw.*) By the Nuisance Removal Act, 1855, in rural districts there was a power to the vestry to appoint a special committee to be charged with the duties of executing that Act; would not that power approach to a considerable extent what you suggest as to the local authority?—Yes, as to nuisances, but I have found a reluctance on the part of the guardians to put the 5th section of the Act of 1860 in force.

1304. Therefore you consider the Act of 1860 which abolished that power of the vestry and gave it to the guardians a retrograde step in legislation?—Yes.

1305. Under the former Act the vestry which would comprise all the ratepayers in a country parish had power to appoint a special committee charged with duties under the Act; you mean that you consider that a better plan than what is adopted under the Act of 1860, transferring that power to the guardians?—Yes, when you have got the ratepayers to form a committee, because that is essential, as long as you have the power in the whole body you can do nothing with it.

1306. That is, you consider the Act of 1860 a back ward move in giving it to the guardians?—Yes.

1307. You were speaking of poisonous water in connexion with Cinderford and other places; there is no legal power now, is there, to close any pump or poisonous source of water and forbid persons using it for drinking purposes?—I believe not.

1308. Would you not consider that such power should exist in some sanitary body?—Yes, it is most essential. I have an instance of the kind at this moment before me.

1309. I think you mentioned that, under the 49th section, you thought that the power of complaint ought to be vested in one-tenth of the ratepayers instead of one?—Yes, I think the present power is too general.

1310. In a rural parish do not you think that you would find very considerable difficulty in getting a complaint at all?—I would give either to numbers or to rateable value the power of complaint to the Secretary of State, and one-tenth of the rateable value is very easily acquired. I have taken the same proportion as in the Local Government Act, under which one-tenth puts the Act in operation in certain cases.

A. Taylor, Esq.

10 May 1869.

1311. Does not the Local Government Act usually exist in places where there is more combination than generally is to be found in rural districts, and more facilities of getting people to act together?—Yes; but I think it is essential that there should be some amount of local support in every case of complaint.

1312. You are not obliged to proceed upon a complaint when you get it, are you?—No; but I do not remember an instance in which we have refused an inquiry when there was a complaint; and I certainly have inquired into several where I think complaints need not have been made.

1313. In the intermediate board of which you spoke, you would have some medical authority in connexion with the board, would you not?—I assume so, because medical questions would be dealt with.

1314. And he would be appointed and removed by the Secretary of State as the rest of the paid officers of the board?—Yes, that would be indispensable to Government appointment and control.

1315. I think you said that the intermediate board should have power to carry out works?—Yes, in the case of refusal by the local authority.

1316. Why I ask the question is, because I think that we have had a very strong opinion from Mr. Rawlinson that it was undesirable that that board should carry out works, that what should be done should be to compel the local authority to do its duty, but that any other board stepping in would incur very great responsibility. I presume that is not your opinion?—Mr. Rawlinson and myself do not agree upon that point, we have had a good many discussions about it.

1317. Would you have that intermediate board to act simply as a court of appeal, or to act *proprio motu* where the local board did not do its duty?—I would give a power of appeal by the local authority from the decision of the intermediate authority to the central authority.

1318. Would you have the intermediate authority interpose of its own accord on its own motion, or only when there was some appeal against the decision of the local board to it?—I would give them the power of moving themselves, acting on their own responsibility and on their own authority.

1319. (*Mr. Cave.*) Do you think that in every rural parish you would have that independent action of ratepayers which would put the churchwardens or overseers in motion?—The churchwardens or overseers should be put in motion on the requisition of a small body of ratepayers.

1320. Do not you think that in some rural parishes you would not be able to get even that independent action of the ratepayers?—Then my intermediate authority would be useful.

1321. What would be the composition of that intermediate authority? what sort of persons would be upon the board?—I think you want a medical man, and you want someone conversant with engineering works and works of that character, and you want a man with a good head for business, for money matters, and the details of business generally; that is the sort of composition of the board that has occurred to my mind.

1322. Do not you think that such a board as that would excite very great opposition amongst people accustomed to guardians and justices, and not accustomed to such a board as that?—I do not see why it need excite so much opposition. I assume that they would use their power with discretion, and not be unduly harsh; that they would persuade and induce, as well as compel.

1323. Have you weighed that point in your own mind?—I am quite aware that public opinion would be against my idea of creating bodies of paid Government officials, but I have come to the conclusion in my own mind, because I cannot see my way to a satisfactory board elected by a local constituency.

1324. Do you think it would be possible to get over the repugnance which would be felt in the first instance to such a board?—I think so; I hope so, at least.

1325. Is it not the case with regard to districts under the Sanitary Act that they are framed in a most capricious manner?—Most capriciously.

1326. Sometimes for the purpose of avoiding opposition a piece is left out which ought to be in, for instance?—Yes.

1327. Therefore it is quite your opinion that some independent authority should have the formation of those districts?—Yes, there is a modified appeal to the Secretary of State now in cases in which a district is objected to by a certain number of ratepayers; they can appeal and ask for a modification of the boundaries, but I would make it compulsory in every case.

1328. Is not that appeal in cases where they are included, but not in those where they are left out?—They must be within, otherwise they have no right of appeal.

1329. Then it does not touch the mischief of leaving out a piece which ought to be in?—No.

1330. You stated, did you not, that the expense of making the Local Government Act Office self-supporting would be so small that it would not be likely to deter any locality from adopting the Act?—I do not think it would.

1331. With regard to byelaws the model code which you have prepared in the Home Office cannot be adopted by any locality without an Act of Parliament, can it?—It does not need that; the proposed byelaws are deposited in the district at the office of the local board; public notice is given that they are subject to inspection for so long, they are then submitted to the Secretary of State for his approval, they are signed by him if approved and then passed.

1332. Is it not necessary that they should previously have an Act of Parliament enabling them to pass those byelaws?—No, they do it under their powers as a local board, under the 34th section of the Act of 1858.

1333. I understood Mr. Norris the other day to state that an Act of Parliament was necessary for that, for he says, "We can only make byelaws under "the provisions of an Act of Parliament. If we "want any new provisions we are obliged to go to "Parliament for a special Act?"—He must have been alluding to the byelaws which they themselves have embodied in their own Improvement Act.

1334. In answer to this question of mine, "If you want fresh powers to make other byelaws, your plan now is to proceed by a provisional order, is it not?" Mr. Norris said, "No." I then asked him, "Must you then have a fresh local Act?" to which he replied, "We can only make byelaws under the provisions of "an Act of Parliament, and if we want any new "provisions we are obliged to go to Parliament for a "special Act." Do you imagine that that simply refers to Halifax as being under a special Act?—Yes, to their own Improvement Act, because as a local board they have had their byelaws approved by the Secretary of State in the way I have described.

1335. (*Lord R. Montagu.*) You spoke of the inconvenience which arises from Crown property not being rated. Did you ever meet of any cases of inconvenience from not being able to carry out waterworks or sewage works through and over Crown property?—No, I have not met with any instance of that, but no doubt there would be difficulty in such cases.

1336. I believe that you cannot carry any sewage works, or waterworks, over Crown property without getting the leave of the Office of Woods?—No, I presume not.

1337. You cannot tell me of any inconvenience which has arisen from the difficulty in getting permission?—No, I cannot. The only instance of Crown rights is the one I have alluded to, namely, East Dean, where these rights affect the general condition of the town, which is chiefly due to the operation of those Crown exemptions.

1338. Would it be advisable to bring the Crown property under the general laws in that respect?—

I think that it ought to pay the same as all other property.

1339. Would you take power to carry waterworks and sewage works through Crown property just the same as you would through any body else's property?—I do not see why you should not.

1340. There is still a difficulty, is there not, with regard to foreshores?—I do not know anything with regard to the question of foreshores.

1341. When you spoke of doing away with the vestry, you merely allude to the initiative in putting the Acts into operation, but you would still retain the same body to act, namely, the ratepayers, would you not?—Certainly.

1342. The ratepayers are not a very good body to carry out the Sanitary Acts, are they?—When they have elected a committee the latter are the proper body to carry them out.

1343. Did you ever consider the question of the advantage of double election to form a body to carry out those Acts; that is to say, the guardians of the union are elected in the first place, and if the guardians of the union were to elect the body to carry out those works, would you not get much better men than if you merely took the ratepayers of the parishes?—I would rather leave it to each locality to form its own committee.

1344. The metropolitan board is elected by a double election, is it not?—Yes, but I do not know its constitution exactly.

1345. You spoke of the union of districts by means of a provisional order; will you explain the precise object that you have in view by the proposal of a union of districts; what would you attain by it?—I first take the question of main sewerage, and the difficulty there is now in getting a system of main sewerage carried out in a district, because in the course of carrying out that system of main sewerage you invade another district, and it may be a third; what is wanted is the power to carry on the outfall sewer to some point where you could deal with the sewage without doing mischief to the adjoining districts.

1346. Would not that objection rather point against the provisional order system, upon a requisition by five or six ratepayers such as you have just recommended. Do not you think that the union of districts ought to be compulsory?—Yes; the union of districts should be compulsory upon a petition to the Secretary of State. No provisional order can be granted by the Secretary of State except upon a petition from the district.

1347. What I mean is this,—why should you wait for a petition; would not it be better to impose it upon those boards, supposing they did not petition?—That is one of the many functions that I would give the mediative authority.

1348. That the intermediate body should be able to petition?—Yes; they might petition.

1349. To prevent, we will say, the water at Kingston being polluted with the sewage of Oxford, to take an example?—That is rather an extreme example, because you are going very far away from Kingston when you are at Oxford.

1350. I am aware that it is an extreme example, but it is with such an object that you would propose a union of districts?—Yes.

1351. We might extend those examples step by step up the whole river so as to take in the whole watershed; would it be too much to say that the whole district within the watershed should be united under the government of the intermediate body?—In very many cases this compulsory union would take the watershed.

1352. Instead of its being united in some or even in many cases, would not it be better to do so at once in every case?—You are taking me to the subject of main sewerage at present.

1353. I will take you then to other subjects. With regard to arterial drainage, do not you think that the same remark equally applies, namely, that the towns up the river would desire that the towns below should carry out arterial drainage, and deepen the bed of the river in order that those above might not be subject to floods?—Yes.

1354. Then equally in the case of arterial drainage, just as it is in the case of sewage, we ought to take the whole river basin as one area, and not a portion only as it would seem, otherwise those below will not incur the expense of arterial drainage for the benefit of those above; and those above will not spend large sums to divert their sewage for the benefit of those below?—But you get in some cases such enormous areas that I am afraid that they would be too large to be manageable.

1355. Then the only objection is the size of the area, is it not?—Yes, and that you are creating a new division with which no one as yet is familiar.

1356. Are you aware that the Thames Conservancy Act has taken the Thames basin and put it under the conservancy board?—I believe the main stream, not all the tributaries of the Thames; the Conservancy only goes three miles from the river. In the case of the River Lee, the conservancy board embraces the contributaries of the Lee, which is a very important difference.

1357. In the case of the Thames, the committee on the bill in 1866 recommended that the whole of the Thames and all the tributaries should be comprised in the jurisdiction of one conservancy board, did they not?—I do not know that. I only know the jurisdiction of the present conservancy board. (*See Appendix*, p. viii.)

1358. Its area is the largest watershed area of all, is it not?—I suppose it would be. I do not know if that of the Severn be larger.

1359. It is very nearly, is it not, 4,000 square miles?—I cannot say, but I daresay that is correct.

1360. This intermediate body (which you propose, I believe, with the same object as Mr. Tom Taylor, to act as a buffer between the local authorities and the Secretary of State,) you suggest should consist of three paid Government officials, do you not?—I said a small board of three or five, my notion is that a small number of men would work best.

1361. Would such a board as that act as a buffer between the local authorities and the guardians?—I think so.

1362. Would not some collision necessarily arise between the body itself, which is appointed and paid by the Secretary of State, and the local authorities?—Not necessarily; in the locality itself they would be able to deal with these cases much more efficiently. They might come into collision, no doubt, but that is the purpose for which buffers exist.

1363. Would there not be less collision, if, instead of having three paid officials appointed by the Government, you were to have a board elected by the different local boards within the river basin or watershed area, giving us at once that double election which I just now spoke of?—A local board so elected would merely be a reflection of the apathy and indifference and ignorance which I wish to overcome.

1364. You do not think that a double election would strain out the apathetic persons?—I doubt it.

1365. With regard to the county quarter sessions, you propose that it should undertake sanitary works, not because it is the best authority for doing so, but because it is the existing authority, or one which is as yet familiar?—The county, as the area of the district authority.

1366. The present duty of the county quarter sessions are totally different from the duties you recommend, are they not; namely, the administration of criminal law, the gaols, the police, bridges, coroners, and so forth?—Yes.

1367. The functions of the two are not similar at all?—Not at all.

1368. Would not it be better for sanitary objects rather to extend the area of the operation of those county functions than to give the county these sanitary works in addition?—I do not think that the

A. Taylor, Esq.

10 May 1869.

enforcement of sanitary laws is a duty that you have a right to put upon quarter sessions.

1369. Did not you propose that when you talked of the county taking up the matter?—No; I only proposed that the district board should be responsible for its expenditure to the county financial board, if it is established, or to the central authority.

1370. But not that the county should carry out sanitary works?—No.

1371. You say that in your inspection you keep clear of questions of the origin of diseases?—Yes; as much as I can, because I am not a medical man.

1372. Then the duties of the Privy Council inspector and those of the local government inspector are quite different?—They are different.

1373. Then, supposing we had one central authority to administer the sanitary laws, would you still have two different sets of inspectors, or would you have one set of inspectors to do both duties?—I think that in many cases inquiries might be conducted independently by one or the other; but certain cases would arise in which you would need a medical inspector, in some cases certainly; I do not say generally.

1374. You could not assimilate the duties, even although the officers were united?—I heard the evidence of the secretary of the office on that point, and I think that if the two functions were united in one office, you must have some medical inspectors.

1375. You are able to give the Commission the history of the Terling case; that place has no local authority, has it?—Yes; every place has a local authority, the vestry.

1376. It is not under the Local Government Act?—No.

1377. Now will you give us the history of that case?—The question that was put to the secretary about Terling seemed to imply that there was some considerable delay in getting the Act to work. As there was none, I begin by stating that the absence of delay is not due to any excellence of the Act, but to the fact that Lord Rayleigh was the resident proprietor there, and he was in earnest about having the place put to rights, and of course, the vestry obeyed his orders in the matter, or else I should have a very different tale to tell of the Terling vestry. It was an important case, because that village was the scene of a most frightful epidemic. In the proportion of the number of deaths to the number of the population, it was the worst epidemic, I believe, that has been known in modern times in England. On the 5th of February 1868, the medical department of the Privy Council wrote a letter to the Home Office, calling attention to the report of the medical inspector as to the condition of Terling. On the 10th of February I was sent down with Dr. Thorne, the medical inspector of the Privy Council to Witham, to meet the guardians of Witham union in which Terling village is situated. In the afternoon of the 10th I inspected the village with Dr. Thorne, and on the 12th by arrangement with Lord Rayleigh I met the Terling ratepayers. I explained to them their position and duty under the Sanitary Act, and obtained their consent to call a vestry meeting on the 20th, which was the earliest day, for the purpose of appointing a committee. On the 17th I sent in a preliminary report to the Secretary of State. On the 20th the vestry of Terling met and instructed Mr. Clark, a civil engineer, who attended by Lord Rayleigh's directions, to prepare plans for carrying out a combined system of sewerage and water supply for the village. On March the 20th the vestry appointed a committee, Lord Rayleigh and the Honourable Mr. Strutt being amongst the number. On the 26th Mr. Clark laid before the committee his plan, report, and estimates, the latter amounting to 1,720*l.* The same day the committee accepted his estimate, and on the 2nd of April I made my second report upon the above facts to the Secretary of State. On the 14th of April the committee applied for the Secretary of State's sanction to borrow 1,700*l.* for the above works, and on the 20th the sanction was recommended by me. Therefore from the first complaint to the Secretary of State by the medical department to the giving sanction to the plans and to the loan, there elapsed the period from the 5th of February to the 20th of April; but if there had been no Lord Rayleigh, or if Lord Rayleigh had been obstructive, I should have had a very different statement to make.

The witness withdrew.

S. A. Notcutt, Esq.

(7.) Stephen Abbott Notcutt, Esq., examined.

1378. (*Chairman.*) You are the town clerk of Ipswich and clerk to the local board, are you not?—I am; I have been town clerk more than 30 years.

1379. Has Ipswich adopted the Act?—It adopted the Public Health Act in 1857.

1380. In the year 1857 you adopted the powers given in the Act of 1848?—Yes.

1381. And the Act of 1858 became afterwards applicable to you?—Precisely.

1382. Do those Acts, in your opinion, repeat many similar provisions so that it would be an improvement to consolidate them?—I think it would be a great improvement to consolidate the Local Government Act and the Public Health Act with the other Acts which are already incorporated, such as the Towns and Police Clauses Acts and the Nuisances Removal Act. All those Acts contain similar provisions, and it is sometimes difficult to determine under which Act you will proceed.

1383. So that there is both repetition and confusion of legislation?—Repetition and confusion, because although they are similar they are not precisely alike.

1384. What is your local board?—The town council.

1385. Under what authority does your council meet for the purpose of action?—That is regulated by the general powers of the Municipal Corporation Act, the 5th & 6th of William the Fourth, chapter 76.

1386. Under that Act you elect a committee to put the law in force?—The town council is convened in accordance with the Municipal Corporation Act.

1387. I think under the 133rd section of the Public Health Act of 1848 proceedings for the recovery of any penalties can only be taken by the party aggrieved or by the local board. Can you suggest any better mode for facilitating such proceedings?—I think that a committee of the town council ought to have power to take those proceedings.

1388. Why do you think that section defective which only enables the party aggrieved or the local board to take proceedings?—Because the board can only act at a meeting of the town council convened under the provisions of the Municipal Corporation Act. In many cases, therefore, before we can take proceedings against a party to recover penalties, we must have a meeting of the council, which must be convened by three days notice served upon every member of the council. A committee of the council ought to have power to initiate proceedings. Under the Nuisances Removal Act a committee may be appointed, and that committee can have power as a committee to take proceedings, but that applies only to the provisions of the Nuisances Removal Act.

1389. By the Public Health Act, and the Local Government Act, where works are required for abating nuisances, and similar works, the local board has power to execute the works, and to recover the expenses from the owners; do you think that those powers are deficient?—I think that those provisions are extremely defective. I think that instead of the local board doing the work, and then recovering the amount expended of the parties, it would be far more efficacious if the provisions of the Highway Act, for instance, were followed, that is to say, if you were to

receive the amount from the parties before you expended it. When a highway is out of repair an application is to be made to the magistrates, and the magistrates are to call evidence before them, and they are to fix the sum to be paid by the parties whose duty it is to do the necessary repairs.

1390. How could you levy payment before you know what it amounts to?—The parties are, by the Local Government Act, liable to do the work, and the local board has to execute the work only in default of the parties doing it themselves. What I should propose would be this, that instead of the local board doing the work and then recovering the amount of the parties, the local board should have some means, through the magistrates, or in some other way, of ascertaining what amount is required, charging the parties with it, and after getting the amount to expend it in carrying out the work.

1391. You would in fact in the first place have to levy the sum upon an estimate?—Yes, as you do by the Highway Act. By the 94th section of the Highway Act, the 5th & 6th of William the Fourth, chapter 50, when a highway is out of repair, you have to go before the magistrates, give evidence of the amount required, and then to make the parties pay it, and the amount recovered is applied in repairing the highway. We have a case now pending at Ipswich where the parties having property on each side of a road, memorialized the local board to make up the road, and after doing the necessary works, to charge the owners with the expense. We had plans prepared, and the parties had notices served upon them to do the work, but they did not do it. We did not expect they would, and the local board ordered the work to be done, and we are now taking proceedings to recover the costs. The parties know that their property has actually been benefited by the work, and that we cannot undo it; but they are now fighting us before the magistrates, and disputing their liability.

1392. Have you found the powers in the Public Health Act defective as to the removal of nuisances?—Yes, I think we have.

1393. In what way, seeing that the 59th section of the Public Health Act of 1848 vests refuse in the local board, and directs them to sell and dispose of it?—There is no express power by that section to enter and remove it.

1394. The 59th section of the Act of 1848 provides that if at any time an accumulation of nuisance shall not, after notice, be removed, it shall vest in and be sold, or disposed of by the local board, and the proceeds thereof carried to the district fund account; in what point is that defective?—We should prefer that the sanitary inspector, or some officer of the local board, should have express power given to him of entering to remove a nuisance. It may be that the local board has power to enter, but it is not expressly given by the section. It is only said that the filth which is to be removed is to vest in the local board. You may, perhaps, go and get what belongs to you, but there would be difficulty in your officer doing it.

1395. Have you found your powers under that section deficient?—I do not know that I can name a case. We have generally found that upon notice the manure, or that which occasions the nuisance, has been removed. Where it has not been removed, I think we have rather flinched from directing the officers to go and seize it. The local board is the corporation, and they cannot act without a meeting of the council. It is not a *committee* of the local board, but the *local board* that has to do this. It is not said that the local board or any of their officers may enter and serve, but only that the local board may do it.

1396. In your opinion the law is defective, and not the local board in default?—Just so.

1397. In the 64th section of the same Act, which gives a list of offensive trades, do you think that the list is deficient?—We regret that brick-burning is not amongst them, and it has been held not to be so. In the case of the Wanstead Board of Health it was so decided.

1398. With regard to the 85th section of the same Act, which provides for contracts made by local boards, have you found that the restrictive conditions imposed by that section have been obstructive of the works?—Yes, I think they have. In many cases we should have contracted rather than do the work ourselves if those restrictions had not been in the Act.

1399. Do you think there is not sufficient security to the ratepayers?—I do not think that those provisions add any security to the ratepayers. Those provisions require that an estimate is to be made and advertisements inserted for contracts.

1400. What better security would you propose to the ratepayers?—I do not think that the ratepayers require any security. You have to enter into a contract, and there must be an estimate; but if you read that clause with reference to contracts you will see there are a number of rather peculiar provisions.

1401. With reference to security, the local board are instructed, are they not, by this section to require and take sufficient security for the due performance of the work?—Yes, and there can be no objection to their taking security.

1402. Will you explain a little more what you think defective in this 85th section?—The section says: "Every such contract whereof the value or "amount shall exceed 10*l.* shall be in writing, and "(in the case of a non-corporate district) sealed "with the seal of the local board by whom the same "is entered into, and signed by five or more members "thereof, and (in the case of a corporate district) "sealed with the common seal, and shall specify the "work, materials, matters, or things to be furnished, "had, or done, the price to be paid, and the time or "times within which the contract is to be performed; "and shall fix and specify some pecuniary penalty to "be paid in case the terms of the contract are not "duly performed; and every contract so entered into "and duly executed by the other parties thereto shall "be binding on the local board by whom the same is "executed, and their successors, and upon all other "parties thereto and their executors, administrators, "successors, or assigns, to all intents and purposes: "Provided always, that the said local board may com-"pound with any contractor or other person in respect "of any penalty incurred by reason of the non-"performance of any contract entered into as afore-"said, whether such penalty be mentioned in any "such contract, or in any bond or otherwise for such "sums of money or other recompense as to such local "board may seem proper: Provided also, that before "contracting for the execution of any works under the "provisions of this Act, the said local board shall obtain "from the surveyor an estimate in writing, as well of the "probable expense of executing the work in a substan-"tial manner, as of the annual expense of repairing "the same; also a report as to the most advantageous "mode of contracting, that is to say, whether by con-"tracting only for the execution of the work, or for "executing and also maintaining the same in repair "during a term of years or otherwise: provided also, "that before any contract of the value or amount of "100*l.* or upwards is entered into by the said local "board ten days public notice at the least shall be "given, expressing the nature and purpose thereof, "and inviting tenders for the execution of the same, "and the said local board shall require and take suf-"ficient security for the due performance of the "same." The previous estimate of the surveyor, specifying as to the best mode of doing the work, whether the contract should include not only the execution of the work, but also the reparation of it afterwards,—all that, I think had better be left to the local board to determine at the time.

1403. You would suggest an alteration to that effect?—I would.

1404. The 98th and 99th sections of the same Act refer to the making of a general or special district

A. Notcutt, Esq.

10 May 1869.

rate, do you consider those provisions unsatisfactory?—I do. The Act requires, as you will see, an estimate to be made, and that that estimate shall be deposited at the local board office a certain number of days prior to the day fixed for making the rate. It follows, therefore, that there must be two meetings,—You must have a meeting of the local board to approve of the estimate, and you must have another meeting of the local board seven days afterwards to make the rate. The usual mode of making a rate—the poor rate and all other rates—is to treat the estimate and the making of the rate as one transaction. We have found it inconvenient separating the proceedings in this way, and I can hardly conceive that there could be any use in it, because when you meet to make the rate you must make the rate exactly according to the estimate; you cannot vary it. You estimate that you want to raise so much; that estimate lies at the local board office for seven days, and then you are obliged to have another meeting to make the rate. That is not the way in which the poor rate, or the highway rate, or any other rate is made.

1405. Your proposition upon those sections is that the estimate and the rate should be one transaction?—Yes, one transaction.

1406. Have you any suggestion to make as to the publication of the rate?—The Act requires the rate to be published as the poor rate. A poor rate has to be published by a notice on the church doors before the morning service on the Sunday after the rate is made. Now there are 13 parishes in Ipswich, and we have to put this notice on the church doors of all those parishes. A publication, corresponding to the publication of a poor rate, would be to put a notice of the making of a general district rate on the door of the town hall or of the local board office.

1407. Do you think that too much is required to be printed in the notice itself?—There can be no use in it. There are 13 parishes in Ipswich to which the general district rate applies, and you have to publish the rate upon all the church doors, instead of publishing it upon the town hall door or the door of the local board office. The poor rate is made for a parish, and it is reasonable enough that the publication of that rate should be upon the door of the parish church, but the publication of the general district rate should be upon the town hall door or upon the door of the local board office.

1408. Is it stipulated in the Act of Parliament that the several purposes for which the rate is made must be set forth in the estimate?—Yes, and that I think is exceedingly inconvenient. In the estimate you must state the purposes for which the rate is made, and it has been held that those purposes must be stated with sufficient exactness, and that you must not combine one item of expenditure with another; and inasmuch as there must be some grouping, there is a difficulty in making the selection, and the rate is invalidated if you do not specify the purposes properly.

1409. Have you ever had a rate disputed owing to any informality in this respect?—Never; we have been particularly fortunate; but it has not been so in other places, and we have always feared it. The Worksop local board of health had a difficulty in this respect.

1410. The section providing for a rate provides that each of the premises throughout the district must be separately assessed, does it not?—Yes. I think it would be a great improvement if instead of having a general district rate assessed upon each property throughout the district, the rate might be made as the county rate is made, and as the borough rate is made, that is to say, to assess each parish in a lump sum, leaving the parish officers to raise it as they do the county rate and the borough rate, and pay it out of the poor rate. By that means we should get rid of the large expense of collectors, and all the losses for empties and those who do not pay. For 30 years we have collected the borough rate of Ipswich in that way, and we have never had any difficulty. It seems unreasonable that we should make and collect a rate for paving, &c. the town, in one way, and a rate for maintaining the police and the gaol, in another.

1411. In the 55th section of the Local Government Act there are certain exemptions from rating, are there not?—Yes, tithes, woodlands, market gardens, or nursery grounds are to be assessed at one-fourth only.

1412. Do you think it unfair that open spaces should pay less than building ground?—I think so. I do not see upon what principle they should be exempt; they are not exempt from other rates, and if they are not exempt from the poor rate, why they should be exempt from a rate for paving and lighting a town I cannot conceive. The wear and tear of the pavement by the owner of a market garden must be quite as much as that of a private resident, in fact a person who has a market garden wears out the pavement to a much greater extent than the occupier of a private residence, as he uses the town for the disposal of his produce.

1413. What suggestion have you to make as to bye-laws?—The byelaws, I think, are great difficulties as the law now stands. The 34th section of the Local Government Act enables the local board to make bye-laws upon a variety of subjects, and a model list of byelaws was issued by the Home Office, and byelaws have been made for Ipswich as well as other places upon that model; some of them have been held to be invalid, and the ground upon which their validity has been impeached applies, I think, to nearly all the bye-laws made upon that model.

1414. What is that principle?—Chiefly that they are *ultra vires*, that they attempt to give local boards more power than they are entitled to; for instance, the first byelaw "with respect to the level width and "construction of new streets, and the provisions for "the sewerage thereof" provides that "every new "street shall be laid out, and formed of such width "and at such level as the local board shall in each "case determine." All the byelaws are much in the same way, leaving it to the local board to determine in each case what shall be done. That is held to be beyond the power given by the Act. An Act of Parliament could give the local board power to have new streets made in such a way as they should in each case determine, but no byelaw can give such power.

1415. Can you give us a case of any decision against the validity of a byelaw?—Waite *v.* Garston Local Board of Health, 37 Law Journal, New Series, Magistrates' Cases, p. 19; Hattersley *v.* Burr, 14 Law Times, New Series, p. 565, (Exchequer); Burgess *v.* Peacock, 16 Common Bench, New Series, p. 624; and Young *v.* Edwards, 33 Law Journal, New Series, Magistrates' Cases, p. 227, were decisions against bye-laws. Upon the decision of those cases a suggestion came from the Home Office that we should alter the byelaw to which those cases applied.

1416. Were those decisions that certain byelaws were *ultra vires*?—Yes, particularly in the case of Young *v.* Edwards.

1417. But were the byelaws which were held to be *ultra vires* adopted from the model of the Home Office?—Yes, certainly; and an alteration was suggested by Mr. Taylor from the Home Office. A circular was sent in consequence of one of those decisions, and an alteration was made in the byelaw, but that alteration was afterwards held to be invalid. We have never made any alteration. I have no doubt that all the byelaws on the model of those issued by the Home Office, if they were contested, would be held to be bad as *ultra vires*, because to give the local board the power in each case, to say how this is to be done involves uncertainty, and is therefore contrary to the essential property of a byelaw. I would suggest that if the object to be attained by these byelaws be of general application, that is to say, if the byelaws are to be the same for every place, it is far better that the object should be attained by an Act, and not by a byelaw. A byelaw should be, if I may say so, a law applicable to a particular locality from some excep-

tional circumstances appertaining to the locality.—A general sanitary regulation applicable as well to Ipswich as to Norwich, or any other place, should be by positive and general enactment.

1418. Do you yourself think that the general scope of the byelaws under those Acts might be embodied in a general law?—Yes, certainly.

1419. But do you think that a general Act could be so framed as to prevent the necessity of making byelaws by any local authority?—No; I think that the local authorities ought to have power to make byelaws, just as the corporation has power, that is to say, to make byelaws applicable to the particular locality to meet some particular circumstance that may be in existence there, and not elsewhere.

1420. But you think, do you not, that much is dealt with by a byelaw now which might be dealt with by a general law?—Yes.

1421. What do you think defective in the provisions of the Towns Improvement Clauses Act, 1847, as to obstructions in streets?—The Towns Improvement Clauses Act contains sundry provisions for the removal of obstructions in the streets, but they are all preceded by the condition that those obstructions do not hinder the free passage of the public, so that as to signs and projections, if they are above the heads of the foot passengers, it does not seem that there is any power to remove them. In Ipswich it is now the fashion to put out certain sign boards, and we have a difficulty in removing them.

1422. Do you consider that the provisions on the same subject in the Towns Police Clauses Act 1847 are also defective?—I think so. There are a number of offences mentioned in the Towns Police Clauses Act which can be abated, provided the public are annoyed. The 28th section of the Towns Police Clauses Act provides that every person who, in any street, to the obstruction, annoyance, or danger of the passengers, shall do any of the things there mentioned, shall be subject to a penalty, but if you look at the section you will see that the penalty ought not to depend upon proof of the obstruction, danger, or annoyance.

1423. Have you adopted in Ipswich any general plan of sewerage?—We have not determined upon any plan of sewerage at present.

1424. Are you waiting until the best system is more thoroughly decided on?—We are, that is to say, we are hesitating to lay out money in the present state of the case.

1425. But are you not liable to proceedings while you are waiting?—Certain complaints have been made as to some parts of the town, and we endeavour to remedy them in the best way we can. I should say that there is not the slightest indisposition on the part of the local board to incur any amount of expense that is necessary in order to have a perfect system of drainage.

1426. Do you not think you will have to wait a long time if you wait until people are all agreed upon the subject?—I think it is very likely we should; I do not know that we should wait quite so long as that, but in the present state of the law it is at the peril of the local board, to create a nuisance to an individual, and they might have to stop their outfall as was done at Banbury. At Banbury they had a perfect plan of sewerage, but they got into great difficulty with regard to the outfall.

1427. If there was anybody in Ipswich with sufficient public spirit to proceed against you now for a nuisance you would be liable, would you not?—I do not know that we should be liable. The Secretary of State would send down and make an inquiry, and we should be quite ready to have any plan adopted that he thought was desirable. It is not that there is an unwillingness on the part of the local board to sewer the town, but they do not see their way to do it.

1428. Do you think it is the business of the Secretary of State, or that he is in any way qualified to state what is the best system?—I do not say that it is the business of the Secretary of State to say what is the best system. I merely mention the Secretary of State, because the remedy which the Act provides, if the local board neglect their duty, is that the Secretary of State may send down an inspector and order the work to be done. That is the proceeding we are liable to, and we should be thankful if the Secretary of State would come to us and point out how it should be done.

1429. You think if the Secretary of State proceeded to order the works to be done you would have to go on with some work?—Undoubtedly, and we are quite willing. One of the committees of our local board is appointed for the purpose of considering the subject, and there are on that committee four or five civil engineers, and there are practical chemists, and others engaged in agriculture; and we are quite ready to do anything that we can.

1430. But the Court of Chancery, without stating the nature of the works, may in the meantime order you in some way or another to abate the nuisance, may they not?—I do not think we are under any apprehension of a proceeding of that kind. We have done nothing. The Lord Chancellor might grant an injunction to restrain our creating a nuisance, but he cannot interfere with us for not abating a nuisance.

1431. If he were to issue an injunction against your polluting the streams, would not that necessitate your commencing some works or other?—Yes, if streams are polluted by us; but we have not polluted any stream that I am aware of.

1432. (*Earl of Romney.*) With regard to byelaws, I understand you to say that you think it is desirable, if it can be done, that as little should be left to byelaws as possible, and as much as possible should be put into an Act of Parliament?—Precisely so. I should say that unless that course is adopted there should be some provision by which byelaws, when approved by the Secretary of State, should be unimpeachable. We have two issues now to try where the question is disputed. First there may be a question as to the construction of the byelaw, whether this particular offence is met by the byelaw; and then we have also to try the question whether the byelaw is not *ultra vires*.

1433. I think you also added that certain things must be left to byelaws?—Yes, I think so.

1434. Those byelaws, in your opinion, should be of a general nature, and not made to affect particular cases?—Yes, certainly. If they are of a general nature they are improperly called byelaws, they are not byelaws at all; they are the law of the land, or they should be so.

1435. I understand you to be of opinion that as much as possible they should form part of the law of the land?—Yes.

1436. But there are certain other matters with regard to which it might be desirable that they should be changed more rapidly than the law could be changed, and that those should be in the nature of general byelaws?—I think that there should not be any general byelaws at all, but when what you seek to accomplish by byelaws is of a general character it should be by an Act of Parliament.

1437. When I speak of a general nature, I mean something like the general rules of the Poor Law Commissioners?—I think laws of a general nature should be embodied in an Act of Parliament.

1438. What would you leave to a byelaw?—I would give local boards power to make any byelaw that they may think necessary owing to some particular circumstance arising in the locality which is not of a general nature.

1439. You mean, not as against a particular individual, but as regards a certain class of cases?—As regards certain cases, not against any particular individual. There may be something in a particular locality which cannot be remedied by the general law, and that should be met by a byelaw; that is the province of a byelaw.

1440. With regard to Ipswich; you do not mean to express that you are unwilling to apply the Act, but that you are doubting and hesitating while all are in

S. A. Notcutt, Esq.

10 May 1869.

doubt as to the best mode of dealing with sewage?—Yes, that is so.

1441. Is that the only reason?—Yes, that is the only reason. Some few years ago we were going to make a large intercepting sewer, to collect all the other sewers, and to carry the sewage down into the estuary of the Orwell; very much in the same way as the sewage of London is now carried down the Thames and put out at Barking Creek.—Plans were prepared, and sections very elaborately got up, and we had an elaborate report of an engineer upon it; but we feared that the result must be either a nuisance to the neighbourhood, or that we should pollute the river, and since then there has been a growing feeling against putting the sewage into the river at all.

1442. You think if that had been done it would have been a wrong step?—I have no doubt about it.

1443. (*Mr. Shaw.*) Under the Public Health Act of 1866 there is power for the nuisance authority to provide a proper place for the reception of dead bodies, in order that if a person dies in a room where persons live and sleep, the body may be capable of being removed there; have you done anything under that clause at Ipswich?—We have not done anything under that clause; but I should say that attached to the cemetery there is a house for the reception of dead bodies, and built for the purpose.

1444. Do you find that persons will remove their dead there before burial?—No, there is an unwillingness to do so, but still there is a house, and it has been constructed expressly for that purpose.

1445. Is the house properly watched by any person resident on the premises?—Yes, perfectly.

1446. (*Mr. Powell.*) Have you a water supply at Ipswich?—Yes.

1447. Under a private company or under the corporation?—Under a company.

1448. (*Mr. Bircham.*) Is there any general system of sewerage in Ipswich at all?—No; the night-soil at present is carried away in farmers' waggons; a very large quantity is disposed of in that way; we have as many, I should think, as 90 farmers' waggons in a week loaded with night-soil from the town.

1449. Is the sewerage conveyed into any public cesspits?—The general plan is to have a cesspool to each house.

1450. There are waterclosets there commonly in use, are there not?—No, not commonly in use; there are many, but not one-sixth part of the houses have waterclosets.

1451. What is the population of Ipswich?—By the last census the population was 37,719, and the present population is estimated to be about 42,000.

1452. (*Mr. Paget.*) Are you able to speak at all as to the health of Ipswich whilst these questions are being discussed?—According to the last return of the Registrar-General, I think Ipswich is the third of the most healthy towns in the kingdom—18 per 1,000.

1453. Do you hear anything from the medical men there of the prevalence of fevers of any kind?—No, except that just at the present time there is a great deal of talk of smallpox.

1454. (*Lieut.-Col. Ewart.*) Do you get your water supply from wells to any extent?—The general supply of the town is from a very deep well.

1455. From house wells, I mean?—Very little now; almost the whole of the town is supplied by the water company.

1456. Where is the well which gives the general supply to the town?—It is in that part of the town comprising the parish of St. Clement; it is a very deep well, and through chalk. It is a well that was originally used in order to obtain water for the manufacture of paper.

1457. Are there many houses in the neighbourhood of that well?—Yes.

1458. What is the subsoil?—This well is almost entirely through chalk.

1459. But above the chalk, where the houses are situated, what is the soil?—I should think it would be gravel.

1460. Do not you apprehend that there is danger of pollution from the leakage of cesspits through that gravel?—No, the well is not liable to that; it is through chalk; it is impossible that there can be any connexion between the two, I should think. I am not aware of any houses so close to the well as to affect it.

1461. Do you apprehend that there would be any difficulty in getting land in the neighbourhood for the disposal of sewage if you carried out drainage works?—No, I think not.

1462. (*Chairman.*) How many inspectors of nuisances have you at Ipswich?—We have one inspector of nuisances.

1463. Do you find him work efficiently?—Yes, very.

1464. And you find one to be sufficient?—We have not found it otherwise.

1465. What is he?—He was a surveyor and he acts also as surveyor to the corporation.

1466. We may gather from your general evidence, may we not, that by the amendment of the law which you have suggested the Local Government Acts, if consolidated, would work well?—I do think so.

1467. And would be sufficient for the good government and sanitary condition of towns?—I think so.

1468. Have you any experience of the rural districts in your neighbourhood?—No.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Thursday, 13th May 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.
The EARL of DUCIE.
The Right Hon. LORD ROBERT MONTAGU, M.P.
The Right Hon. STEPHEN CAVE, M.P.
Lieut.-Colonel EWART, R.E.
JOHN ROBINSON MCCLEAN, Esq., M.P.
JOHN TOMLINSON HIBBERT, Esq., M.P.
EVAN MATTHEW RICHARDS, Esq., M.P.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
JOHN LAMBERT, Esq.
FRANCIS THOMAS BIRCHAM, Esq.

R. B. Grantham, Esq.

13 May 1869.

(8.) RICHARD BOXALL GRANTHAM, Esq., examined.

1469. (*Chairman.*) You are a civil engineer, are you not?—Yes.

1470. And an inspector under the Drainage Acts, under the Inclosure Commissioners?—Yes.

1471. Particularly with respect to the Land Drainage Act of 1861?—Yes.

1472. Have you yourself held meetings under that Act since the passing of it?—Yes, I have held about 22 meetings at the places mentioned in the following list:—

List of Districts formed under the Land Drainage Act, 1861.

Name of District.	County.	Whether a District Board or Commission of Sewers.	Extent.	Area of Watershed.	State of the District.
			Acres.	Acres.	
Moreden Carrs	Durham	District Board	4,000	—	Works completed. The marsh reclaimed
Wormbrook	Hereford	Commission of Sewers	1,977¼	42,428	„ „ Great improvement.
Wissey	Norfolk	District Board	8,240¼	—	Some of shallowest places in the river are being dredged out.
Ladden Brook	Gloucester	Commission of Sewers	957	8,960	Works completed. Parts much improved.
Longdon and Elders-field.	Worcester	District Board	3,595	17,000	„ in progress. Nearly completed.
Llangorse	Brecon	Commission of Sewers	1,085¼	7,948	Works not fully carried out. Partial improvement.
Maxey	Northampton	District Board	7,918	21,417	Some work has been done.
Martham	Norfolk	Commission of Sewers	591½	2,707	No works done. Taxing area enlarged only.
River Idle	Nottingham	Do. do.	6,000	—	Very little done in clearing river of weeds and some shoals.
Stanmoor	Somerset	District Board	676½	1,318	Pumping engine erected and at work. Great improvement in land.
Currymoor	Do.	Do. do.	1,820	5,086	Ditto ditto ditto
Dysynny	Merioneth	Do. do.	2,564	40,960	Works completed. The marsh reclaimed.
Staunton Common	Hereford	Commission of Sewers	1,454	7,844	„ „ District much benefited.
Winterton	Norfolk	Do. do.	1,055	2,500	„ „ Partly a marsh reclaimed; and the remainder very much improved.
Chedzoy	Somerset	District Board	2,412½	4,348	Pumping engine erected and at work. District improved.
King's Sedgmoor	Do.	Commission of Sewers	11,259	51,200	Very little work done. No result.
Frodsham	Cheshire	District Board	4,217	11,259	Nothing done.
Stanton Harcourt, Northmoor.	Oxford	Do. do.	2,364	3,560	Works completed, and lands secured from the floods of the Thames.
Northmoor	Somerset	Do. do.	3,235	11,102	Pumping engine only recently erected.
Aller Moor	Do.	Do. do.	2,155½	3,338	Pumping engine. Not yet erected.
Haddiscoe	Norfolk	Do. do.	1,628	4,990	Ditto ditto
Muckfleet	Do.	Commission of Sewers	1,404	10,176	Commission only recently issued.
			70,608¾		

1473. I see that the meetings which are upwards of 20 in number have been held in several counties in England and Wales?—Yes. I will also hand in the following list of Commissions under the Act of 23d Henry VIII., chapter 5.

A List of Commissions of Sewers appointed under the Act of 23d Henry VIII., cap. 5.

Ely, Isle of	Wisbeach Hundred.
Essex	Burnham Southminster.
	Fobbingham, Cownigham, &c.
	Foulness Island.
	Havering and Dagenham.
	Rainham Bridge and Mucking Mills.
	Tendring Hundred.
Gloucester	Henbury, Langley, &c.
Kent and Sussex	Guldeford Level.
Kent	Dengemarsh.
	Gravesend and Sheerness.
	Lombards Wall to Gravesend.
	Mersham, Ashford, &c.
	New Romney.
	Teynham, Tonge, &c.
	Walland Marsh.
Lincoln	County of, City of, and part of the county of Nottingham.
Monmouth	Caldecot Level.
Norfolk	County of.
	Blofield Hundred.
Nottingham	County of, and several limits in Lincoln, York, Derby, and Leicester.
Somerset	County of.
Suffolk	Plything, Mutford, &c.
	Falkenham.
	Iken.
	Sudbourne.
Sussex	Rape of Arundel.
	Bramber.
	Lewes and Laughton.
	Pevensey and Hastings.
	Western parts.
Wight, Isle of	Sandown Levels.
York	East part of East Riding.

1474. Was not the Land Drainage Act, under which you are an inspector, an Act for the purpose of amending the law relating to the drainage of lands for agricultural purposes in England and Wales?—Yes.

1475. Under that Act were Commissions of Sewers issued for specified areas?—Yes; under the first part of that Act.

1476. And those Commissions were issued, were they not, on the recommendation of the Inclosure Commissioners?—Yes.

1477. How many inspectors were appointed?—With the exception of the first case on the list I have been the only inspector as yet.

1478. What are the general powers of the Commissioners of Sewers?—The Sewers Commissioners can proceed to do the necessary works for the purpose of improving the drainage of river valleys and the outfalls, and can tax the areas for the cost.

1479. What were the powers of the District Drainage Boards formed under this Act?—The District Boards have the same powers as the Commissioners of Sewers under part 2 of the same Act. The distinction is very trifling, except in the constitution. In the first instance, with respect to sewers, the parties interested, or one-tenth of the owners of the acres of the district, memorialise the Inclosure Commissioners to have an inspection of the area that they wish to have improved, and upon that the Inclosure Commissioners send down their inspector, who holds meetings and inspects the neighbourhood, the object of which is, to inquire, into the genuineness of the petition, as to the propriety of the proposed boundaries, and the number of proprietors assenting to or dissenting from the prayer of the petition. If one-third of the owners of the extent of land in the area dissent, the Inclosure Commissioners have to dismiss the petition. After the meetings I make an appointment with the parties to go round the boundaries of the district to see that the boundaries proposed by the promoters are such that the districts would be improved by the works that they propose, having regard to certain levels. My principle has been that the boundaries of those districts should be somewhere about five feet or three feet (as circumstances may admit in the formation of the country) above the flood levels, and when I have satisfied myself upon all that, I report to the Inclosure Commissioners the whole of the proceedings that have taken place, from the meeting till the time that I have

R. B. Grantham, Esq.

13 May 1869.

finished my inspection, and they upon that consider the report, and will pass it or not, as they consider right. I am now alluding to the Commission of Sewers.

1480. Was that a substitute for the old Commission of Sewers appointed from time to time by the Lord Chancellor?—It was rather an extension of it. Perhaps I should just shortly tell you that in the year 1859 or 1860 I was introduced at the Home Office from the Inclosure Office to Sir George Cornewall Lewis and to Mr. Clive, a member of this Commission, who was Under Secretary, to see what improvement could be made in the arterial drainage and outfall laws generally. Sir George Cornewall Lewis, on considering the matter, thought it better to continue the powers of the old Sewers Commissions, and to improve them, than to make any completely new board. I helped Mr. Thring in the formation of this Act; but in the process of that consideration and Mr. Thring's drawing up this proposal, it was determined to have the second part, which is really a more popular kind of election than the other. During my inspection and my visits in the country the parties propose a list of members for the Boards, either for the Board of Commissioners or for the Drainage Board. The constitution of the Commissioners of Sewers is rather different from that of the District Drainage Board, in this way that the former are elected for life, the qualification being at least 100*l.* a year (3 & 4 Wm. 4. c. 22. s. 3 and 4). There is the same mode of appointing them through the Lord Chancellor and the two Chief Justices of the Queen's Bench and Common Pleas as there is under the old law, the 23d of Henry the Eighth, except that they are for life, and that the Commissions not terminable as the old Commissions are. With regard to the Drainage Boards, they are more popular, a new Board being elected annually; the qualification which they have is generally according to an acreage rate. The largest owners of acreage and sometimes large tenant farmers of the district have been put on those Boards.

1481. Who are their electors?—The electors are those persons who are in the district, who are also proprietors or large tenants.

1482. Is there any specified qualification for electors?—They must have been rated to and have paid the sewers rate of the district; the electors have from one vote to ten, according to the amount at which they are rated. (24 & 25 Vict. c. 133. s. 69.)

1483. In fact the District Drainage Board is a representative body?—Yes, it is. Then they have much the same power as the Commissioners of Sewers as to performing works and maintaining them, and taxing the area for the expenditure, the borrowing of money, and so forth.

1484. What is the difference generally between the Commissioners of Sewers and the District Drainage Board?—The only difference is practically in their election and in their duration; their operations are the same.

1485. The object of both is to conduct and to control the arterial drainage and outfall of river valleys?—Yes.

1486. What is the power of the Inclosure Commissioners to make provisional orders, confirmed by Parliament?—That is for the formation of a drainage district, and is done by a provisional order upon the owners of more than two-thirds of the area consenting, and is confirmed by Parliament in the usual way.

1487. Does not the Land Drainage Act of 1861, 24 & 25 Vict. c. 133, incorporate the Lands Clauses Act?—It does, except as to the purchasing of land by compulsion.

1488. Does it incorporate only certain sections of that Act?—Only certain sections. The provisions of the Commissioners Clauses Act of 1847 are incorporated with respect to certain things.

1489. Will you describe the jurisdiction for rating and also the principle of rating?—The jurisdiction of the rating is within the boundaries that I, as inspector, have settled. As to the principle, I have had a good deal of trouble in making the people who value understand what the principle of the law really is. As far as that goes, my idea is, and I believe it is that of most persons of experience, that the land should be valued in proportion to the benefit conferred by the works. To explain that, I may say that part of a district may be very much more improved by the withdrawal of water or the prevention of floods than other parts, and I consider that that part ought to be taxed at a higher rate than other parts of the same district that are only just affected by the drainage. For instance, if I should settle that the boundaries should be five feet level above the actual common flood line, I look upon it that the land by pipe drainage, and the clearing of farm ditches, and so forth, is benefited to that extent, and therefore I fix the boundary upon that principle.

1490. Is there any appeal against your valuation? Yes. I do not value, but there is an appeal to quarter sessions against an erroneous valuation.

1491. Who makes this valuation?—A person appointed by the governing body, and there have been appeals.

1492. Is the incidence of the rate defined in the Act?—It is not very clear. One of the incorporated Acts is 4 & 5 Vict. c. 45, and that was an Act to amend 3 & 4 William IV., c. 22. There is a slight expression in that which leads one to believe that it meant the mode of rating the lands which I have been describing. It is really upon the principle in proportion to the benefit and advantage received, or capable of being received; that is, lands improved by the drainage, or saved from damage, is the expression of the old law; for instance, sea-banks, and so forth. If a sea-bank, which is included in this Act, were made, all lands that would be saved from damage or reclaimed from the sea would of course be the lands that received benefit; but I find a very great difficulty in making the surveyors understand that principle. They go to the poor rate and they take that as the basis of their valuations, which is quite wrong, but it is done to facilitate the matter. There is another principle which I would recommend, that which has been exercised in Ireland. At the time of the arterial drainage in that country, their principle was to value the lands in the state in which they were before the drainage commenced; and then, when the works were finished, they were valued again, and the improved value was made the rateable value. I have published a table of that sort, which, if the Commission will allow me, I will hand in in a later part of my evidence.

1493. Do you think that the Irish mode of rating for improvements and arterial drainage is a better system than ours?—Yes, I think it is, for that purpose.

1494. As you make your areas only so many feet above the highest flood, I presume that in no case would your areas coincide with the areas of the river conservancy boards which take the watershed?—No, my levels would not go to so great an elevation as watersheds.

1495. Would there be any objection to making them coincide—there might be no objection to your area being larger than you wanted, if it was an object to make the governing body of both areas the same?—I do not think that there would be any objection to that.

1496. Do the same powers prevail over towns and country districts like the conservancy board of any tidal river?—Under the old law, the 23d Henry VIII. cap. 5, there seems to have been no distinction between town areas and agricultural or country areas, and in one case I know there has been a clashing of jurisdiction, which I believe will come under the attention of the Commission. That is the case of West Ham. When the works were in progress there, the sewers commissioners of Havering, which is in Essex, bordering on London to the east, somewhat interfered with the mode of procedure of that West Ham board.

1497. Would you suggest that where there is this conflict of small towns with larger areas, you should have

those laws which create the conflict repealed?—Yes, I think that it would be well that those powers under the 23d of Henry VIII. cap. 5 were repealed, and at the same time a distinct law enacted for agricultural drainage.

1498. At present I believe there is no special law for agricultural drainage independently of towns?—No further than the Land Drainage Act goes; and it still does interfere or would interfere in the case of the Commissioners of Sewers if it were not for the mode of inspection. I will just cite a case. In the river Idle, which is a large district that I inspected, they proposed to take in a part of the town of Retford in Nottinghamshire. I objected very much to that, because I thought it was quite distinct from the purposes of the Land Drainage Act, and I cut out those portions of the town which they had included—some gardens and some houses which went down close to the river—and I merely took power over the river as an outfall, so that the Drainage Board should have power only to deal with the river itself, and not tax the house property, or the gardens, or that sort of property; and I have made it a rule in most cases to exclude as much as I can villages and towns, or even farmsteads and buildings, from the area of the Drainage Districts. I have not been so particular about farmsteads and those sort of buildings, except in some cases, but I have been careful to exclude villages from the Drainage Act. I thought that the two were quite distinct from each other.

1499. The two objects of sewage and clear water drainage are very much the same, are they not?—To a certain extent they are, but I do not doubt that those Acts intended only to deal with the clear water and to get rid of water from the lands as agricultural lands.

1500. Would not it be the same process of survey very much, to arrange both for preventing the fall of polluted drainage into rivers, and for liberating the clear water from lands inclining to those rivers?—I think that it would be better to separate them, because the town itself can manage its own affairs in that way, and that they should prevent the pollution. The agriculturists perhaps in the management of the agricultural drainage would not care about the pollution of the rivers so much as getting rid of the water off their lands.

1501. Would not the actual survey and mapping for the purpose of liberating land from water and for the purpose of keeping polluted drains from rivers be the same?—Yes, certainly that would be so, so far.

1502. The area comprehending both would be all that land in which waters would flow by gravitation into a certain river, and it would be the same survey and plan which would keep foul water from gravitating into that stream and would liberate the clear water into that stream, would it not?—Yes.

1503. (*Earl of Romney.*) Do you see any objection in uniting the town drainage with the clear water drainage, if it could be done, and if this Act empowered it?—I have hardly considered the subject much. I am looking at it in this way: I think that there would be some objection on the part of farmers and agriculturists to be mixed up with towns questions.

1504. But with regard to towns or considerable country villages, do you see any reason against uniting them with the country districts for purely sanitary purposes?—Villages of small size might, I think, be taken into the drainage areas, because the same parties are mostly interested both in the land of the village and in the land round about it and the land in the valleys.

1505. (*Lord Robert Montagu.*) Do you say that under the Land Drainage Act of 1861 districts could be formed for the purpose of arterial drainage?—Yes.

1506. Could those districts be formed of such a size as to take in the whole river basin or watershed?—Yes, no doubt it could be so.

1507. Have districts been formed which have taken in the whole river-basin or watershed?—No, they have not; I have not had an instance of it. The difference, of course, is very considerable; I have generally considered and reported upon the watershed as well as the drainage area so as to leave the Commissioners to judge what kind of works are necessary, and to advise them as to the kind of works that are necessary to take off the water of the watershed, as well as the water of the particular district. It must be so; the works necessary for a small area of course must be sufficiently large to take the water off the watershed.

1508. You are favourable, it seems, to the union of all the districts within a river-basin under one government for the purpose of arterial drainage?—Yes, I think so. Of course there must be special provisions for very large towns.

1509. The principle is the same, is it not, whether the river basin or the watershed is a large one or a small one?—Yes, it is so.

1510. I presume that the only difficulty which arises is as to the constitution of the governing body?—Yes, I should fancy so, that of towns as compared with large watershed and river areas.

1511. Would you suggest that the governing body should be a representative body, or a body of paid officials appointed by the Secretary of State?—In thinking over that, I have always considered that one or two members should be paid according to the area, because the fisheries map, which has been laid before the Commission, gives you a notion of the enormous difference between some watersheds and others.

1512. You would suggest that a few should be appointed by the Government and that the rest should be representative members elected by the population within the watershed?—Yes, with a certain qualification or a certain proportion to the area drained.

1513. Could you not get over the difficulty of the towns by allowing the town councils to appoint their representatives?—Yes, that might be so, certainly.

1514. And might we say that the guardians of unions might appoint their representatives?—Yes.

1515. Of course limiting the number, so as not to get an unwieldly body?—Yes.

1516. And that body would act as a buffer between the local authority and the Secretary of State, or the central government, would it not?—Yes, I think so. I think that some scheme of that sort would be very useful in the country for several purposes.

1517. Then you do not see any very great difficulty in carrying that out, I presume?—No, I should think not. The agricultural and the town questions come very close together now in one respect, and that is in the utilization of sewage. The one interferes or may interfere with the other, but it might be regulated by a body having control over the whole watershed.

1518. And also in procuring a water supply from the hills adjacent?—Yes; it is of very great importance that that should be done. The Land Drainage Act (1861) does not give power to store water for the use of populations, at least not sufficiently so, but I have always suggested to the parties who are making those drainages to store water for the summer droughts, and for getting it for the villages, if possible, instead of letting it run away in the main outfalls. But you will understand that those drainage areas are very low in the country, and it is difficult to get an elevation for the water in that case, whereas in the watershed you can conduct the water almost to any level, that is to say, to districts above the lower country.

1519. And also such a unity of government would be beneficial in questions which might arise as to the deepening of the bed of the river miles down for the benefit of some lands higher up the river?—Yes.

1520. And also with regard to arterial drainage, you must carry the drains from a district high up the river to a district lower down in order to get a fall?—Yes, you must.

1521. Therefore if you had not a large area under one government, you would have to go for the benefit of one district above into the province of the government of another district below?—Yes; it has occurred in my experience, that those at the outfall want perhaps to construct works, and the other parties at a higher level

R. B. Grantham, Esq.

3 May 1869.

will wait to see what they do, and will take advantage of their operations, instead of coming into the district, to be both the governing body and taxable alike; and I have endeavoured to counteract that as much as I could.

1522. So that unless there is that unity of government over the whole river basin or watershed, persons below might be taxed and be called upon to pay for works which would be for the benefit of those above?—Yes.

1523. In the case of sewage it would be *vice versâ*, those above would be called upon to pay for works which will only purify the river for the advantage of those below?—Yes, that is so.

1524. So that upon all those grounds it would be advantageous if we could have this unity of government over the whole watershed or river basin?—Yes; it is a very large question, of course. As I have just now stated, there would be enormous differences, taking the Thames, the Severn, the Mersey, the Medway, and all those large rivers to place them under one body, as compared with the river Idle and several other rivers that I have had to deal with.

1525. You mean that, though difficulties may arise, you do not consider that those difficulties are insuperable, and you are not recommending an impossibility to us?—No, except in the large areas. I cannot quite see clearly how the difficulty is to be got over, owing to the sizes of the areas.

1526. We will suppose for a moment that such a governing body over the whole watershed is established; have you considered at all the means which you would employ by rating or otherwise to obtain the necessary funds for carrying out the works?—No, I have not; certainly not on so large a scale as your question indicates.

1527. Have you done so on a small scale?—I have considered the smaller scales of river valleys, merely the valleys, not the watersheds, not taking in the tributaries to the extent that your lordship is now mentioning.

1528. What would you suggest in that case?—I have hardly made up my mind as to how to tax such an area. Of course wherever benefit is conferred I would tax them in proportion; and as in the case of the irrigation which they are carrying on in France under certain decrees of the government, if the Land Drainage Act, 1861, were ever amended I should propose that the irrigation of clear water as well as of sewerage should be embraced in it. I should put a separate tax upon the district in proportion to the benefit conferred, because it would be necessary to have other kinds of work for irrigation, distinct from those of drainage for removing the water, and also for bringing the water on. There must be more expense, and therefore there must be an extra tax upon those who wish to avail themselves of irrigation and also of drainage. The drainage and the irrigation may go together, or the drainage may be separate and the irrigation may be separate.

1529. I believe that when the Government gave power to deepen the River Bann in Ireland, all the proprietors within a certain distance of the river, say 10 miles of each bank, had to pay a certain tax, while the proprietors who were more than 10 miles from the banks had to pay a smaller tax in order to procure the funds for deepening the river?—Yes, I believe that that was done upon the principle which I have been recommending. There is a table in the paper which I read at the Institution of Civil Engineers, in which I introduced the Irish mode of valuing and taxing, and that table will give a very good idea of the plan which was pursued in Ireland.

1530. Will you put in that table in illustration of your evidence?—Yes. (*The same was delivered in, and is as follows*):

DRAINAGES IN IRELAND.

NAME OF THE DRAINAGE DISTRICT.	Area of Lands within One Mile of the Lands drained or improved, belonging to the same Proprietors as the Lands drained or improved.	LANDS DRAINED OR IMPROVED.				
		Area of Lands drained or improved.	Total Cost.	Original Annual Value of Lands drained or improved.	Increase in the Original Annual Value of Lands drained or improved.	Cost of Works per Acre.	Annual Charge per Acre of Principal and Interest.
	A. R. P.	A. R. P.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	s. d.
District of the Blackwater, in the Counties of Meath and Kildare.	11,010 1 31	3,827 2 18	12,115 16 6	2,119 1 8	1,034 7 9	3 3 3	4 0
District of Lough Neagh, in the Counties of Antrim, Armagh, Down, Londonderry, and Tyrone.	59,002 1 31	29,625 1 24	156,277 14 10	25,656 2 5	9,953 17 7	5 5 6	6 0

District of Borrisokane, in the County of Tipperary.	4,433 3 29	1,517 0 39	10,038 17 11	728 7 10	505 19 5	6 12 4	6 6
District of Shinrone, in King's County and County of Tipperary.	5,533 1 4	1,288 3 7	8,209 2 9	-	434 19 7	6 7 4	6 3

1531. (*Mr. Powell.*) I presume that the Commissioners of Sewers and the Drainage Board have an eye to the drainage of estates which they assume to be drained, field by field, independently of their action?—Yes, by pipe drainage. That is a question which surveyors have been a good deal confused about with respect to rating. They have generally thought that they ought not to tax those fields that are already pipe-drained to the same extent as other fields that are not pipe-drained; but I do not think that that ought to be. I think that they ought to be taxed at the same rate as fields that are not drained.

1532. But where this Act of Parliament to which you have referred is in operation is anything done by the authorities thereby created with reference to the drainage by pipes or otherwise, of individual fields?—They do not interfere with the pipe drainage.

1533. All that they have to do with is the getting off the water from the fields, assuming the fields to have been drained?—Yes. It is only the arterial part of it, not even the ditches and tributaries in some cases, they merely make an outfall.

1534. Then your answer of course covers the case of cottages and houses. By your authority under the Act you do not regard the case of individual houses or individual cottages in any degree?—No, I do not. One of the reasons why I exclude them is that they should not tax the dwelling as an hereditament; and in some cases it has happened that they have taken the annual rental of the house instead of rating the land upon which it stands, it and its garden.

1535. But I presume that if there be a house, whether a large house or a small house, standing upon an area that is dealt with under this Act, the owner

of that property may drain his houses into the drains constructed under the Act?—Yes, he may.

1536. He is in the habit probably of doing so?—Yes, and his farm buildings, and so forth, are drained into the arterial drain.

1537. And the houses for the farm labourers, and the like?—Yes, and all that comes within that area; there is no doubt that they make the best of it when they get it.

1538. Will you read the 26th section of the Land Drainage Act, which shows the manner in which the powers of the Lands Clauses Act are arrived at?—The marginal note is "Provisional order by Inclosure "Commissioners to be confirmed by Parliament." Then the section enacts that "upon the completion of "such an inquiry, the Inclosure Commissioners may, "by provisional order empower the commissioners to "put in force, with reference to the land mentioned "or referred to in such order, the powers of the said "Lands Clauses Consolidation Act, in relation to the "compulsory taking of land; and it shall be the duty "of the Inclosure Commissioners, as soon as con-"veniently may be, to take all proper steps for the "confirmation of such provisional order by Act of "Parliament, and when so confirmed it shall be deemed "to be a public general Act of Parliament, and to "take effect accordingly, but previous to such confir-"mation it shall not be of any validity whatever."

1539. Then there is no power to purchase land otherwise than by agreement, except by a provisional order confirmed by Parliament?—No.

1540. The Act of 1861 gives the same power, does it not, to the Drainage Board as is possessed by the Commissioners of Sewers?—Yes, it does.

1541. I observe that the elective body for the Drainage Board is composed of those who during the year preceding have been rated to the sewer rate of the district, and have paid all the sewer rates?—Yes.

1542. And likewise that voters have a number of votes according to a scale, the number of votes increasing with the value of the property with reference to which they pay rates?—Yes.

1543. In answer to another member of the Commission you suggested the storage of water; can you point to any section of the Act which gives the Commissioners of Sewers or the Drainage Board any power to store water, and, having stored it, to dispense it?—There is no other power except what is implied in the words "supply of water for cattle" and "irrigation." They may do such works as will provide for irrigation, and this storage could in a manner be made available for irrigation.

1544. But not for domestic consumption?—No, not for domestic consumption. It would be merely amongst themselves that they would do it in a country place.

1545. Supposing that works were erected under the power that you hint at rather than fully describe for the purposes of irrigation, and that water was used for the purposes of domestic consumption, and that rates were actually levied with a view to the construction or maintenance of those works, do you think that those would be considered good rates under the Act?—No, they would not; they have no power to rate for such purposes.

1546. You have not made any allusion, I think, to the latter part of this Act of Parliament, which contains important provisions, enabling an owner under certain circumstances therein set forth to make drains over portions of the property of others?—No, I have not.

1547. Could you very shortly give the heads of that part of the Act?—I will give you the reason why I did not state that to the chairman before. I did not think it was exactly connected with the object of your Commission as a sanitary matter; it was merely as between two private parties, and not to get rid of sewage. There have been, I should say, no proceedings under that part of the Act yet that I am aware of. The Land Drainage Act of Ireland certainly has copied it verbatim, but I daresay that you are aware of another Act which has been used for the same purpose, that is to say, the 10 & 11 Vict. c. 38, commonly called Lord Lincoln's Act. That was intended as an Act for arterial drainage, to enable persons to drain through other lands than their own, and to clear watercourses, and so forth, to enable owners to get rid of their own water; but from some reason or other it has been very little used. I have been appointed assistant commissioner in one case, which is one of the very few which have been appointed under Lord Lincoln's Act. It was that of a person who was a minor, and who could not give consent to another person cutting a drain through his property, and there was a good deal of contention about it. Lord Lincoln's Act enables a person to drain through any land between his own and the outfall, belonging to a person who objects or is under disability, by applying to the Inclosure Commissioners. After public notice parties may object. The Inclosure Commissioners can appoint an assistant commissioner to make inquiries and report, and if they approve they issue an order authorizing the execution of the proposed works as allowed by them. If any land is taken the value is to be ascertained under the Lands Clauses Act. The Act provides also (sec. 14) for cases of occupiers of adjoining lands neglecting to cleanse and scour existing drains and watercourses, or to join others in doing so. It also provides (sec. 18) that persons interested in lands authorized to be drained under any local Act may have the same drained under the provisions of that Act. There have been only seven cases in which any of the powers have been applied for, and only three orders have been given.

1548. I am not clear whether your answer which you have just given us refers to Lord Lincoln's Act or to the Act of the 24th & 25th of Victoria?—The last part of my answer was as to the 10th & 11th of Victoria, chapter 38.

1549. The 10th & 11th of Victoria has chiefly reference then to persons under disabilities?—Yes.

1550. But the Act of the 24th & 25th of Victoria has only reference to the case of reluctant owners as I read it?—Yes; but the other Act refers to reluctant owners as well as to persons under a disability.

1551. Is it the fact that Lord Lincoln's Act, although an older Act than the one of the 24th & 25th of Victoria is found more practically useful?—I should recommend it in preference to the later Act.

1552. Could you point out any defects in the Act of the 24th & 25th of Victoria which have rendered it less useful than the former?—Except with respect to what I conceive to be the cost I really do not know what the reason has been.

1553. There is nothing in the machinery of the old Act, is there, which appears more convenient and in any respect more tempting than the provisions of the more recent Act?—No, I think not; we have had no experience under the third part of the Act at all.

1554. Can you explain the process under the 76th section in the case of the adjoining owners dissenting?—I have had no experience upon that part of the Act; but it provides that a person requiring a drain and outfall through the property of an adjoining owner may apply for leave, and, if the adjoining owner dissents, two or more justices in petty sessions, or an arbitrator, are (sec. 76) to determine, (1) whether the proposed drains will cause any injury, and (2) whether such injury (if any) can be fully compensated by money. If it is decided (1) that no injury will be caused the applicant may proceed with the works; if (2) that injury will be caused which can be fully compensated by money, then the justices or arbitrator are to assess the compensation, and on payment the applicant may proceed; but if (3) that injury will be caused which cannot be fully compensated by money, then the applicant is not entitled to execute the proposed works.

1555. Does any preference exist in your mind in favour of the old Act as compared with the more recent one which may have been the cause in some

R. B. Grantham, Esq.

3 May 1869.

indirect manner of the action of the old Act and of the inaction of the more recent statute?—No, I cannot tell you that.

1556. (*Mr. McClean.*) Has a District Board the power to interfere compulsorily with the rights of millowners?—No, they have not; only under certain conditions; see sections 17, 18, 19, 20. They cannot remove any obstructions in streams, such as mills, and so forth; they are obliged to have the Lands Clauses Consolidation Act put in force to purchase them compulsorily.

1557. Would it not be essential to any general scheme of drainage in the country that there should be compulsory powers in that respect?—Yes, I think there should, and I can just explain why I believe there was not. When I was with Mr. Thring, with reference to this bill, we had a good deal of discussion upon the power of removing mills and obstructions in rivers, he thought that Parliament would not accede to anything like the arbitrary dealing with mills. I suggested that mills under a certain rental or a certain value should be removable by appealing to the Inclosure Commissioners to their inspectors to value them, but he said that that would perhaps embrace a very wide question as to large mills and so forth. Of course my idea was that no Drainage District, we will say of 4,000 or 5,000 acres, would attempt to remove a large paper mill or a silk mill, or anything of that sort, because the expense would be so large that they would never attempt it; and it could only be in cases which are innumerable in the country, namely, of small mills, such as small grist mills, and bone mills, small things of perhaps 50*l.* or 60*l.* a year rental, that it could be done within the scope of the Commission.

1558. Is there no power at present to remove any mill?—Only by an Act of Parliament confirming a provisional order.

1559. (*Dr. Acland.*) I think in answer to the noble Lord you stated that you saw no objection to there being one board over an entire river basin?—Yes, only I qualified it in this way, that I did not see my way to deal with those very large river basins such as the Thames. I daresay that you are aware of the Fisheries Act map, which gives the watersheds and the comparative areas of the watersheds very fairly, but how we are to deal with such areas as those 3,000 or 2,000 square miles, and so forth, and of course the enormous inspection which that would involve, I am at a loss to know. I should find it very difficult to agree to such very large bodies being formed.

1560. But it may be possible. I understood that one reason for your objection was that you thought there was a difficulty in joining the management of ordinary agricultural waters, if I may so call it, with the management of the sewage of a town district?—Not so very much as that the agriculturists would not like the mixture with the town areas.

1561. Do you think from your experience that there is a real objection on the part of suburban landowners to receive the sewage?—Yes, there is a considerable objection in many cases; I know of several.

1562. Then, supposing that towns found it to be necessary to cast their sewage by way of irrigation upon suburban lands, what are they to do?—They must only take it further off, till they find a place to put it.

1563. Do you think that they could find landowners who would take it?—No; it would not do to leave it in that way, because no one would have it if they could help it near their residences. I daresay the Commission are aware of the Act of 1867, which enables local boards to get land for sewage purposes out of their district compulsorily.

1564. Are there compulsory powers at present in the possession of local boards by which they can compel the suburban districts to take the sewage?—Yes, there are, through the means of the Home Office.

1565. But not in any other way?—No, not in any other way that I am aware of.

1566. Have you had any opportunity yet of judging whether the proper value is paid for such land, or whether the towns are compelled to pay above a reasonable value?—I think that the towns are compelled to pay above a reasonable value.

1567. How would you propose to arbitrate in such cases?—My experience is so very small that I do not know how to answer that question.

1568. At present it is only through inspectors, I believe, under the Home Secretary, that these matters are settled?—That is all.

1569. Have they power to fix the sum?—No, I think not. I think that is done by valuation.

1570. Could you suggest how such power should be given?—No; I cannot suggest how the value can be fixed, which is what I understand your question to refer to.

1571. You have laid down some principles for the valuation, namely, that the sum paid should be in proportion to the benefit to the landowners; do you think that the landowners are likely to benefit by receiving the sewage?—When I was stating those principles of rating, I alluded entirely to the removal of water from land by drainage, but not to receiving sewage, and, as we suppose, thereby improving land to the extent that it does or will do.

1572. Surely there must be in your knowledge many valleys, both suburban and otherwise, in which the landowners would benefit by receiving pure water in the way of irrigation?—Yes, I am aware of that. I have stated already, and I repeat it, that I think it would be very desirable in any scheme that there should be provision for irrigation where a district or county or person should wish to have it, but he should pay an extra rate for it.

1573. But does not that apply with more force, if our present knowledge is correct, to the reception of sewage water supposing the quantity of water is not excessive beyond the agricultural wants of the district?—The question which enters into that of sewage irrigation is the nuisance or rather the dread of nuisance. I do not think it would be such a nuisance as people apprehend, but the apprehension is so great that they would attempt to defeat almost anybody who proposed to carry it out. There has been a very strong effort made lately at Kingston to irrigate some place. I do not know exactly where it is, but I know the parties were defeated in it, the Home Office did not sanction it.

1574. At all events now there is no power of arbitration in matters of this kind?—Not with respect to value, the value must be an arbitrary matter to a certain extent, in fact whatever they can get the land for. I have been just reporting upon a district in the neighbourhood of London—Wimbledon—where I was applied to to report upon the plans of the surveyor of the local board, and they have got some land; and they informed me that if they had gone anywhere else they would have had to pay 1,000*l.* an acre for it. It is a common right; the lord of the manor is letting it to them at a very moderate rate, but they informed me that from the enormous quantity of building going on in that neighbourhood they could not get land elsewhere under 1,000*l.* an acre, and they wanted 130 acres for their purpose. I believe that state of things to prevail very extensively, and the same question has arisen at Surbiton, where they erected their sewer works into the Thames and were going on very well until the Thames Conservancy Act came into operation to prevent their polluting the river, and now that they are compelled to find land, they do not know what to do, it is a most difficult matter; they must take the sewage miles away.

1575. When you have used the word irrigation you have referred to the irrigation of land by clear water and not to the irrigation of land for the purpose of clarifying the sewage?—No; I have referred to clear water irrigation only, under the powers of the Land Drainage Act, and not so much to sewage, although I have had some little experience in that.

1576. (*Mr. Powell.*) The Kingston case is a case of sewage irrigation, is it not?—Yes.

1577. (*Chairman.*) From your experience, which

would you say is the most effectual body, a Commission of Sewers or a District Drainage Board?—The parties have the power of electing which body they will go under; the Inclosure Commissioners do not profess to exercise any control over that. When I have been asked which they should go under, where there are large proprietors and a few of them, and the lands are held largely in the area, I have recommended a Commission of Sewers, but in the case of lands that are very much subdivided, and are held in all sorts of areas, from 10 acres up to 200, I have recommended a District Drainage Board.

1578. Then the main difference between the two is not in their operation but in their constitution?—Yes.

1579. And where there are several persons interested, you prefer a Drainage Board because it is representative?—Yes, and because they are elective. They can change their governing body when they choose, whereas in the case of a Commission of Sewers, as I already said, they are for life, and they can only be removed by the sign manual.

1580. They can be put an end to, can they not?—No, I think not.

1581. Have there been in your experience any appeals to the Quarter Sessions?—Yes, there have on questions of rating. Under the powers of the Land Drainage Act the court of Quarter Sessions can refer it to any person, upon the parties agreeing, and I have had two or three of those cases referred to me where the parties have felt aggrieved as to the amount of rates. In one case in which I had an inspection, when the plans, and so forth, were laid before me, they represented that a large area was to be properly drained and proper works done, and everything of that kind, but in this case they had done all the works near the outfall, they had done nothing to the upper part of the district, which was represented to me as requiring it, as much as the rest of it, and one of the owners appealed against the rate which had been put upon him, he being rated at the same rate as those persons whom the works benefited very much, and when it was referred to me I altered the rate considerably. In another case where there was a district which could be divided into three portions the lower people where the works were heaviest did not want to pay as much as those who were above in another part of the district where the lands were really benefited by those expensive works, but they had done it so clumsily altogether, that I quashed the rate.

1582. Are the appeals restricted to questions of rating?—Yes, they were so in all those cases.

1583. In both cases the appeal was satisfactorily dealt with by the quarter sessions, was it not?—Yes, it was referred to me by the quarter sessions and I have never heard anything about it since.

1584. You have no reason to suggest any alteration in the body at all?—No, I have not.

1585. (*Earl of Romney.*) Did the parties agree to the reference?—Yes, they agreed to it before the quarter sessions, and it was referred to me. I have had three or four appeals of that kind, and those two cases I remember.

1586. (*Lord Robert Montagu.*) You have put in a paper containing a list of the Commissioners of Sewers appointed under the Act of the 23d of Henry the Eighth, chapter 5; they are only selected for 10 years I believe?—That is all.

1587. Had they got any borrowing powers?—I believe they have exercised them, but they cannot exceed the 10 years; nobody would give them credit beyond 10 years.

1588. They have got very few powers altogether, have they?—Very few powers.

1589. Have they any defined boundaries?—No defined boundaries; they range over any counties or any place; and I should also mention as connecting the new Act and the old one, that when an application is made for the formation of a district area under the Act of 1861, the Inclosure Commissioners require the consent of the Commissioners of Sewers and the local boards where those districts would interfere or override, they require that their consent should be given to giving up that portion of their district to this new body. I prepared that table because, as I said just now, they seem to be so connected with the management of large districts, and you would have to remove them or do something with them. If the Land Drainage Act were to be continued as an Act of itself, I would suggest that all the Commissions of Sewers should be done away with, and that all their powers should be carried on under the second part of this Act of 1861 by District Drainage Boards by provisional order and Act of Parliament.

1590. (*Mr. Powell.*) Are the areas large under the Act of the 24th & 25th of Victoria?—They vary from 400 to 11,250 acres.

1591. I presume that the districts are in all cases very sparsely populated?—Yes, very.

The witness withdrew.

(9.) William W. Willink, Esq., examined.

1592. (*Chairman.*) What is your office?—I am secretary to the Public Works Loan Commissioners.

1593. Could you state under what Act your board was formed, and its general object?—I am not prepared to give you the chapter of the Act; it was the Act of 1817, the 57th of George III.

1594. Was not an Act passed in 1853 for altering the mode of repayment of advances by the Public Works Loan Commissioners, under the Public Health Act of 1848, and other Acts?—Yes, by section 108 of the Public Health Act of 1848 the Public Works Loan Commissioners were empowered to make advances to local boards, for the purposes of that Act, repayable in 30 years, but the Act of 1853 reduced the term for repayment to 20 years.

1595. Section 113 of the same Act of 1848 provided, did it not, that interest shall be paid half-yearly, and the mortgage debt paid off by means of a sinking fund, that section being repealed by the 57th section of the Act of 1858, which gives power for raising money on the credit of the rates?—Yes, the Local Government Act does that.

1596. Will you state generally what are your powers of advancing money to local boards?—The powers of the board as regards lending, in so far as regards the terms on which the loans are advanced, and the repayment, are such as require the repayment of the principal by annual instalments during a period not exceeding 20 years, with interest at 5 per cent. upon the principal from time to time remaining unpaid. The limit of the period to 20 years, as regards local boards, will be found in the Act of 1853 (16 & 17 Vict. ch. 40 sect. 1).

1597. Have you any discretion as to the expediency of the works for which the local boards borrow money from you?—The board lend with the sanction of the Secretary of State for the Home Department.

1598. Is there any limit in your Acts as to the nature of the objects for which you may advance money to local boards?—To this extent; we are authorized to lend for the purposes of the Public Health Act, and the limit would be the limit of the objects described by that Act.

1599. Will you state the amount which you have advanced to local boards for works under the different Acts?—Under the Public Health Act, 1848, and Local Government Act, 1858,—690,129*l.* Under the Sewage Utilization Act—19,550*l.*

1600. Have you had any difficulty in getting repayments made regularly upon your advances?—Not any difficulty whatever; there are, so to say, no arrears whatever. I think there was one single loan made of about 700*l.*, in which there was a difficulty, but only one.

W. W. Willink, Esq.

13 May 1869.

1601. If that is the case, can you express any opinion of your own as to whether money might be advanced to local boards upon easier terms, if the law were altered to give that authority?—That ought to be the opinion of the Commissioners, and not of their officer.

1602. But, so far as your experience goes, there has been nothing to reflect upon the security, that is to say, there has been no difficulty found in getting the repayment regularly made?—None whatever. It is a security upon the rates, and, consequently, if there is a sufficient assessable value, I do not apprehend that there would ever be any difficulty in recovering the sums advanced.

1603. What is the whole payment which the local boards have to make to you, including both the interest upon the money advanced, and the sinking fund, which is to pay off the advances in 20 years?—The payments are not made in that manner. The principal is repaid by 20 equal annual instalments, with interest at 5 per cent. upon the principal, from time to time remaining unpaid.

1604. Are not those high terms, upon perfectly good security?—I do not myself apprehend that they can be considered high terms, because the local boards who borrow have had an opportunity of obtaining money in the open market at a lower rate if they could get it; consequently it is not to be supposed that they would take the money if the terms were otherwise than favourable.

1605. It is possible that public opinion may not be sufficiently acquainted with the nature of such securities in the market, and therefore the rate may be higher than the real value of the security would justify?—That may be, but we have no authority to lend at any other rate.

1606. Will you state to us what inquiry the commissioners make before they decide on applications for money?—It is the practice with the board, when application for a loan is made, to issue queries with a view to elicit the information, which the commissioners require, in consideration of the application. Those queries go partly towards ascertaining the nature of the works which are intended to be executed, whether the sanction of the Secretary of State has been obtained to the borrowing, and whether the requirements of the Acts of Parliament have been so complied with, as to make it certain that there will be no question as to the validity of the rates to be assigned as the security. In the next place a return of the assessable value of the property proposed to be rated is required, with the view of enabling the commissioners to judge as to the sufficiency of the security.

1607. Have you a blank form of the queries usually issued, which you can put in as your evidence?—I have such a form with me which I will put in. It will be understood that those forms are not applicable to all cases exactly; they may vary, but in the majority of cases they are applicable. The application might be for purposes of drainage only, or it might be for waterworks; but you can see from the forms what the general character of them is.

1608. Can you give us two blank forms, one of queries relating to applications under the Local Government Act, and the other to applications under the Sewage Act?—Yes. (*See Appendix*, p. xiii.)

1609. (*Earl of Ducie.*) The rate of interest which those boards pay to your board is five per cent., is it not?—Yes.

1610. Considering the goodness of the security, have they not any means of borrowing money in the open market at a lower rate than five per cent.?—The commissioners are not authorized to advance loans at a lower rate than five per cent.; but the Treasury have the power to reduce the rate of interest on loans advanced by the Public Works Loan Commissioners after the loan is issued.

1611. Do they ever get that authority?—The Treasury of late years have declined to exercise their power.

1612. Then practically they have no means of getting money at a lower rate?—Not from the Public Works Loan Commissioners; but they are at liberty at any time to pay off any loan or any part of the loan.

1613. (*Mr. Hibbert.*) Do you know whether the Treasury allow a lower rate of interest to be paid for the public works loans in Lancashire?—Those loans were advanced under special Acts, the Public Works Manufacturing District Acts of 1863 and 1864, which fixed the rate of interest under those special circumstances at 3½ per cent., and gave 30 years as the time for repayment.

1614. But that was done with the consent of the Treasury?—It was done by Act of Parliament. My impression is that the Act of Parliament provided that the commissioners should have power to make the loans at that rate without the consent of the Treasury.

1615. Was that rate of interest specified in the Act?—Yes.

1616. What was the term of repayment under the Act?—I think it was 30 years.

1617. Do you know whether in the repayment of those sums borrowed they are repaid in the same way that the other loans are repaid from the public works loan, that is to say, by a certain number of instalments?—Just in the same way.

1618. Would not it be easier for the places borrowing the money if it was paid back in the way of a sinking fund than under the present principle?—The board have power to advance loans repayable by way of an annuity.

1619. But would not it be easier for the place that it should be paid back in that way, for this reason, that the place borrowing the money has the largest amount to pay the year just after the money has been laid out?—Of course that would be easier for them at the commencement of the period during which the loans are lent them and more onerous towards the close.

1620. Upon the present plan is it not the case that it is more onerous at the commencement?—Under the present plan it is more onerous at the commencement and easier at the conclusion.

1621. Would not it be easier for the place altogether if it was put on the principle of number of equal instalments extending over the whole of the time?—That is rather for the consideration of the borrowers as to whether it would be easier for them.

1622. The borrowers have no voice in it as I understand; it is the Treasury or the Public Works Loan Office which fixes the principle of repayment?—The Act fixes it.

1623. Do not you think from your own experience that it would be easier for borrowers to make a number of equal instalments than upon the present principle?—As I say, it would be easier for them at the commencement, but not at the close; that is to say, they would have a smaller amount to pay at the beginning, but they would have a larger amount to pay towards the end of the period.

1624. That would not be the case if you fixed it at a given number of equal instalments?—Of course not.

1625. You mean that it would be harder at the end in comparison with the present plan?—Yes, the present plan is harder at the beginning, and easier at the end; the other would be easier at the beginning, and harder at the end.

1626. Should not it be rather the reverse?—I do not know; my own idea is that looking to the possibility of repairs, and the wear and tear of works, it is rather preferable that the burthen should be lighter towards the end when the repairs are likely to be heavier.

1627. Is it not the case that very large amounts are laid out for certain works which do not begin to repay for the outlay at the commencement of the term, which take say seven years before they begin to repay for the outlay?—Those works are however, I apprehend, not works of a productive character as to repaying.

1628. Take the case of waterworks?—Yes, to waterworks of course your observation would apply.

1629. Are there cases in which the Public Works Loan Commissioners vary from the mode of paying by annual instalments?—Yes, and in those cases instead of the money being repaid by annual instalments in 20 years with interest on the principle from time to time remaining unpaid the payment is required by way of an annuity, but still within a period not exceeding 20 years.

1630. Could you give the amounts which you lend out from the Public Works Loan Office for local boards in proportion to the whole of the amounts lent from the office?—I cannot give it all out of my head, but it will be all found in the finance accounts.

1631. Is it a large proportion?—It is not a very large proportion.

1632. (*Mr. Lambert.*) A large sum was advanced under the Public Works Manufacturing Districts Act, was there not?—The entire sum authorized to be advanced was 1,850,000*l.*, and I think that the whole, with the exception of about 80,000*l.* or 90,000*l.*, was advanced.

1633. And it was advanced, repayable by instalments not extending over a period beyond 30 years?—It was 30 years.

1634. And the rate of interest fixed by the Act of Parliament was 3*l.* 10*s.* per cent.?—It was.

1635. Has there been any difficulty in obtaining repayment of those loans?—None whatever; they pay very regularly on the whole.

1636. Do you remember whether there was any question raised as to the solicitors' fees on securities?—Yes, there was a question raised at the time at which the Act was brought into operation.

1637. Are you aware whether or not any of those local authorities objected to borrow on the ground that they considered that the fees at that time were excessive?—To the best of my recollection it was rather that there was an apprehension that such would be the case, and that prior to any issue, or at all events, very early in the stage of operations under the Act an arrangement was made by which a sort of scale was fixed of the fees, which the board's solicitors should be authorized to charge.

1638. There was some objection in the first instance raised, was there not, to the solicitors' charge?—Yes; my impression is that the board's solicitors, according to the usual practice, would have required a separate mortgage for each advance, and the arrangement which was made was that the first mortgage should be so worded as to provide for a simple receipt for the subsequent advances being sufficiently full, and that was acceded to.

1639. Was not there also another objection on the ground that the parties considered the fees for the original mortgage excessive?—No, I think not.

1640. There was a scale of fees for mortgages afterwards agreed upon, was there not?—There was a scale of fees for the advances after the first, but no scale for the first.

1641. Then the matter went on pleasantly?—Quite so; we have had no difficulty, nor any complaint whatever.

1642. (*Mr. Powell.*) Will you, in addition to the information which you have given in answer to a previous question, inform the Commission what sums have been advanced under the Labouring Classes Lodging Houses Act, 1851, as amended by the Labouring Classes Dwelling Houses Acts of 1866 and 1867?—Under the Labouring Classes Dwelling Houses Acts 48,500*l.*

1643. Will you also give the same information with reference to the Artizans and Labouring Classes Dwelling Act of last session?—Nothing has been advanced under this Act.

1644. Will you give the same information with reference to the advances under the Baths and Washhouses Act, the 9th & 10th of Victoria?—Under this Act 81,546*l.*

1645. And likewise with reference to the advances under the Recreation Grounds Act, the 22d of Victoria, chapter 27, and the 23d & 24th of Victoria, chapter 30?—Nothing has been advanced under this Act.

1646. If there be any other Acts relating in any sort to the public health or the physical condition of the people will you state the Acts and inform us whether you have made any advances under them?—Under the Burials Acts 765,446*l.*

1647. You stated that the Treasury may reduce the rate of interest; have they unlimited powers of such reduction, or are their powers defined by some statute?—I believe the power is unlimited.

1648. Have there been any returns made to Parliament showing the amount that you have lent, with the conditions of the repayment?—Returns of the amount lent year by year from the time at which the commission was first appointed, are published every year in the finance accounts.

1649. Have there been any cases of long arrears in the repayment of advances?—Not as regards local boards of health, or for sanitary purposes.

1650. But with regard to baths and wash-houses?—No, I imagine not; but I have not inquired.

1651. What remedies have you in case of default?—The remedy in case of default upon the rates I cannot say. If rates were not made there would be a *mandamus* to compel the making and levying of rates, and there would be the ordinary process against a defaulting ratepayer, if he did not pay.

1652. You would have occasion to resort to the circuitous process of *mandamus* in case the authority, whatever it may be, in any instance did not pay with regularity?—I apprehend so, but I am not the law adviser of the commissioners, and I could hardly say positively.

1653. Have you any advantage as compared with private lenders, as regards priority of charge?—Not on the rates.

1654. Have you on anything else?—Not under the Acts to which reference has been made.

1655. (*Mr. Cave.*) Do you ever refuse to lend for the purposes of local boards in cases in which the security is good?—Never, that I am aware of.

1656. Have you not refused to lend in analogous cases, such as those under the Pier and Harbour Acts?—I hardly consider cases under the Pier and Harbour Acts as analogous.

1657. Are not those cases in which the Act authorizes borrowing from the Public Works Loan Commissioners?—Yes, but the purposes are by no means such as to be analogous to the loans which are made for sanitary objects.

1658. Of course the objects are not similar; but what distinction do you draw between your power of refusing in the one case and in the other?—We might consider that applications made for loans under the Harbour Acts might not come sufficiently within the scope of the Acts to justify their being taken into consideration.

1659. Have you not refused in some cases where recommendations have been made by a department of the Government?—No department of the Government has authority to make a recommendation in the case of the Harbour and Passing Tolls Act, 1861. You are referring to cases recommended by the Board of Trade; the Act of Parliament provides that the Board of Trade shall approve of the borrowing, but there is no single word as to their recommending.

1660. You stated, did you not, that in other cases the sanction of the Secretary of State would guide the commissioners in their lending?—Excuse me; what I intended to convey was that the board requires to be satisfied that the sanction of the Secretary of State has been given, because the Act makes the sanction of the Secretary of States a condition of the advance of the loan. The recommendation of the Board of Trade in the case of the Harbours Act is not required, because all that they have to give is an approval.

1661. You do not consider that that approval exonerates you from going yourself into the question?—No,

W. W. Willink, Esq.

13 May 1869.

certainly not; it is only the approval of the borrowing by the parties; it has no reference whatever to the lending.

1662. Of what use is such approval of the borrowing if it does not carry the approval of the lending?—That is a question which Parliament should answer, as it was Parliament that made the enactment.

1663. Then you think there is some fault in the legislation on the subject?—No, I do not pretend to say that there is a fault, I merely tell you what the statute provides.

1664. I want to get at the distinction between the two classes of cases?—In the case of harbours the lending is at the discretion of the Public Works Loan Commissioners, without any sanction on the part of any other Government Department, whereas in the case of lending for the purposes of the Public Health Act, the sanction of the Secretary of State is a necessary condition to the lending by the Public Works Loan Board.

1665. Then in one class of cases you consider that you have a veto upon the lending and not in the other, is that so?—It is not a veto upon the lending, because the lending is the act of the commissioners, and they can hardly be said to have a veto upon their own acts.

1666. Perhaps that is not the proper expression; but in the one case you consider yourself justified in refusing to lend, and not in the other?—I did not say we should not be justified in refusing to lend in the other, but we should not be justified in lending without that sanction.

1667. In the other class of cases also you consider that the recommendation and the sanction of the Secretary of State is not final, but that you have the power of exercising a discretion in the matter?—Yes, we should have the power of exercising a discretion in the matter undoubtedly.

1668. In fact there is no real distinction between the two classes of cases then?—I think there is, because I can see a distinction between the approval of the borrowing, and the approval of the lending.

1669. In either case the board have a right to exercise their own discretion, and to refuse to lend?—In either case they would have that right.

1670. And there is no distinction between the two classes of cases in that matter?—As I understood your question you were seeking to ascertain the distinction which might exist with reference to the powers of other departments in cases of applications for loans.

1671. I want to know whether your board have the entire discretion in matters of lending?—Yes, they have the entire discretion in matters of lending.

1672. And you could refuse to lend in any case to any one of those local boards, even if it had the sanction of the Secretary of State?—Yes, quite so.

1673. Is your decision in such a matter guided in any particular year by the amount lent in that year?—The board, like any other lending institution, would necessarily take into consideration their ways and means. The amount placed at their disposal is limited to a certain sum annually, and they have to satisfy themselves that the state of their funds is such as will enable them to meet the demands upon them. There are cases in which applications for loans are refused owing to the insufficiency of the funds to make the advance.

1674. Do you know on what principle the amount of that sum is fixed in the estimate?—I may state that the amount which the board have at their disposal for advances for ordinary purposes is 300,000*l.* each year.

1675. Is that a fixed sum?—That is a fixed sum for their ordinary purposes. Then there are several of those various other Acts which have been referred to from time to time, as in the case of the Public Works Manufacturing Districts Acts; there are special funds for those and special funds also for harbours.

1676. When was that 300,000*l.* fixed as the sum which was to be intrusted to you for the purpose of lending every year?—I believe it was fixed by the 5th of Victoria, chapter 9, and has been continued by subsequent Acts; lastly by 29 & 30 Vict. cap. 17. sec. 1.

1677. It was by Act of Parliament that that sum was put at your disposal?—Yes.

1678. Then of course under those circumstances you do not send in an estimate every year as to the amount which you think you will be likely to want?—No.

1679. Supposing you do not lend the whole of that sum, is the balance paid into the Exchequer, or do you keep it toward the next year?—We are authorized to draw it all.

1680. If you only lend 200,000*l.* this year you would have 400,000*l.* next year?—Yes.

1681. Do you know that the local boards and public bodies of that kind have considerable difficulty in borrowing in the open market notwithstanding the goodness of their security?—No, I have no knowledge of that, but I can imagine that it might be the case.

1682. Would that be in consequence of the principal not being payable back in one sum?—Yes; there are many lenders whom it does not suit to lend their money to receive it back by instalments.

1683. I suppose that almost the only source from which local boards could borrow money would be insurance offices in fact?—Yes; insurance offices would be the only source, I suppose. I am not aware whether the Bank of England would lend them any money.

1684. Are there not drainage companies and other companies which lend money for those purposes?—I do not know; there are so many of those financial companies now that I really cannot say, or at least there were a great many.

1685. (*Chairman.*) Does not it appear by the first section of the Act of the 16th & 17th of Victoria, chapter 40, as though local boards used to be able before that Act to repay the advances by way of a sinking fund in 30 years?—Yes; local boards may still borrow, and repay in 30 years, but by the 16th & 17th Vict., chap. 40, the Public Works Loan Commissioners can lend only for 20.

1686. (*Lord Robert Montagu.*) Does the Commissioners Clauses Act of 1845 apply to your board?—I cannot say. No doubt there are cases in which it would, but there are so many Acts in which that Act is incorporated that I cannot answer precisely.

1687. But the Act which you have spoken of is the 16th & 17th of Victoria, chapter 40, is it not?—Yes.

The witness withdrew.

C. Wilson, Esq.

(10.) Charles Wilson, Esq., examined.

1688. (*Chairman.*) Are you connected with the local board of health of West Ham?—I am clerk to that board.

1689. Under what Acts does the West Ham board conduct its local government?—Under the Public Health Act of 1848, the Local Government Act of 1858, and the various Acts which have passed since, which are supplementary to them, but those are the two leading Acts.

1690. You have, in fact, adopted the Public Health Act?—We are constituted under the provisions of that Act.

1691. Have you no special West Ham Act?—Yes, we have one, but very little affecting the general question. There was an Act of Parliament passed in the session of 1867, principally with a view of enabling us to build a town hall, by arrangement with the parish officials, and there are a certain few clauses of the Metropolitan Acts incorporated with ours; but in the main we are under the general law; we can hardly be deemed exceptional.

1692. How have you found the Public Health Act work with respect to your construction of sewers at West Ham?—The 69th section of the Public

Health Act, the 11th & 12th of Victoria, chapter 63, provides that in case any future street be not sewered (and then follow certain technical words about making up streets) to the satisfaction of the board, the board may do it, but previous to that notice is to be given in writing to the various owners of the property fronting that street, calling upon them to make up such parts as abut upon their own individual portions. The effect of that is, that if such notices were complied with, you would have a very great piece of patchwork when you call upon 100 people to make up various parts of the road. I thought that perhaps the Commission would understand it better if I produced the working plans which I have with me with regard to two roads which we are now forming, where there are at least 100 properties in each street; we have to find out first the owners of those various properties, some of which occasion a great deal of trouble, as I will explain in a moment; but having found them out, and served them with notices, we call upon them, under the law, to make up that particular portion of the road fronting their own place. In practice not one man in 100 ever does it, and if they did the Commission would see see that it would be, as to the roads, a terrible piece of patchwork; they would not be using the same description of granite, and probably one would make it up in one way, and another in another; but the effect of it is this, that they never do it, as I say, in one case out of 100. The only result therefore of the notices served upon them is to leave the board to make them up themselves, and then in the event of there having been (and it is almost impossible to avoid it) any difficulty in the service in finding out the owner, or if we have been deceived, the owner or the occupier of course gets the benefit of it, and he escapes payment.

1693. Is there anything in West Ham and that suburban district which renders the Act less applicable to West Ham than it would be to ordinary towns in that particular?—No, I think not. In the metropolis it is different; and I happen to know, from being connected with property at Leeds, that in their Local Act all that is required is that when the body, whoever they may be, that are charged with the carrying out of the Sanitary Acts, wish to make up streets in this way, all they have to do is to stick a notice at the end of each street, and if those notices are not complied with the body does that work. If that course to which I called the attention of the Commission is objectionable with regard to the roads, it is doubly so with regard to sewers. In this very road we have called upon about 50 or 60 people to make up their sewers; that is to say, each party would be called upon to make a sewer in front of his own place. Of course it would be utterly impossible that any effective sewers could be made in that way, when you bear in mind that in order to carry out the work the owners of the property on each side must combine. Of course if the owners on both sides combined, they would make the sewer in front of their houses; but then you would have the difficulty of levels, &c., in connecting them with other houses. But when you consider that you have two parties owning opposite houses, you practically call upon the man on one side to make a sort of half sewer, and the result would be that the two parties would most probably overlap each other, so that it must be a complete piece of patchwork, and in point of fact it is never done.

1694. Can you suggest how that section might be amended?—If it is a board with whom it is left entirely, it is at their option to decide what is proper to be done, and if they so decide, I would enable them by advertisement to give notice that it is their intention to do such or such a work. It might, perhaps, be a matter of justice to permit any person objecting to appeal to the magistrates within a given time, but that would not necessitate the calling upon the various owners to make good each particular part in that way which leads to nothing except the possibility of their escape from ultimate payment. I should add that there has been extreme difficulty in doing it in this very case. A great quantity of the land is mere building land now lying vacant, as to which we have no possible proof of ownership. We cannot get at them, and in order to affect the owners, as we cannot serve them with notice, we have to stick up notices upon the land; it must be on some conspicuous part of the particular land. One plot, very likely about 150 feet long, may all belong to one owner, or it may be carved out in various parcels. We have no means of knowing that, and if we do not set up posts upon that particular portion belonging to any particular man, he escapes from payment; and if we do it as we have done, the extreme probability is that the poor people in the neighbourhood go and get hold of the posts the very next night and burn them away to light their fires to heat their kettles with. That is what we generally find.

1695. Are there no powers under the Act of 1858 as to streets and sewers which give local boards the means of carrying out such schemes?—None whatever. There are some clauses in the Act of 1858 which tend to simplify the matter, and which direct how the notices are to be served, and they also point out who is to be deemed the owner at the time the works are completed, which was in doubt before this, because those works must occupy some months, and very often the property is in a state of transition; it is always changing hands. The Act of 1858 defines who the owner is to be, and also in some degree removes one or two difficulties, but not of that character to which I have been alluding.

1696. Is there nothing upon this point in the provisions of those different Acts of 1848 and 1858 and others which give local boards the means of carrying out the general schemes which you suggest, more particularly the Act of 1848?—It was to the Act of 1858, the Local Government Act, that I alluded in my last answer, that it in some degree simplified matters inasmuch as it defines who the owner is, and provides within what time we could recover before the magistrates.

1697. Have you found any particular difficulty in construing those two Acts together?—I cannot say that I have with regard to those two Acts, namely, the Public Health Act and the Local Government Act; but there are difficulties in construing some of the other amending Acts with them.

1698. Are there both cases of repetition and also of conflict in the provisions of those various Acts?—I have not had my attention particularly called to any direct conflict. I think I can point attention to this, that in consequence of this mode of amending and constantly adding to Acts some things escape attention. There is a very prominent case with regard, I think, to the Sewage Utilization Act of 1867, to which I would call the attention of the Commission with reference to ditches in the neighbourhood of and the boundaries of places. The Commission is probably aware that where the Public Health Act is in force the nuisance authority and the sewage authority are the same, but with regard to many of the recent Acts, the Nuisances Removal Act, and those which have been applied in places where the Public Health Act is not in force, the nuisance authority has not been the same with the sewage authority. Under the Nuisances Removal Act the board of guardians were constituted the nuisance authority, but under the Sewage Acts, the Sewage Utilization Act of 1865, and its amending Act, the Sanitary Act of 1866, various powers were taken from the nuisance authority and given to the sewage authority; but in doing so some of the powers given by the Nuisances Removal Act have been transferred to them and others have not been transferred. Not seeing myself, or not understanding any reason for the distinction, I can only suppose it to have been an oversight. I may be wrong, but it appears to me that there is no sense on the face of it why certain powers should have been transferred from the nuisance authority and others which certainly justified as

much the action of a nuisance authority should not have been conferred upon the same board.

1699. What is the constitution of the local board of West Ham?—It consists of 21 members, 18 elected by the people; six go out of office every year, and three of them are appointed by the Havering and Dagenham Level Commissioners, who are commissioners appointed under one of the old Commissions of Sewers which are still extant.

1700. This is the board which in West Ham exercises all those various powers of which we have been speaking?—Yes, all of them.

1701. Do they not conflict with other authorities in the neighbourhood of West Ham?—Slightly. With regard to the body that I have spoken of, the Havering and Dagenham Level Commissioners, they have the control of all the matters connected with the surface drainage of Havering and Dagenham Level, which extends far beyond West Ham. It was found necessary to reserve their powers when the local board of health was constituted, and in some two or three instances we do come a little in to conflict, but not to any great extent; and it is a case so exceptional that I suppose it requires altogether exceptional treatment.

1702. What suggestion have you to make as to the mode by which local boards are to raise the sums necessary for their expenditure in the shape of general district rates?—The suggestion that I should make would be that local boards should generally be put upon the same footing as burial boards and boards of works are in the metropolitan districts. At present in our large parish we have to make separate rates. This is one-third of our rate book (*producing a book of considerable size and showing it to the Commission*); it now consists in our large parish of something very nearly 400 pages, and inasmuch as our board has thought fit to make quarterly rates, the effect is that about 12 of those books have to be made every year with corresponding items, receipts, and checks, and we have to employ another series of collections, all of which is done in other districts by simply making an order upon the poor law authorities and the overseers. The board of health say, "We want so much money," and the overseers raise it at the same time as the poor rate, and the effect is that one class of collectors collect it all, and that all this enormous trouble which, as to a great part of it is merely copying, is avoided. It is so in the metropolitan districts entirely.

1703. (*Earl of Ducie.*) Do I understand you to say that the local boards should do the work instead of calling upon the individual owners to do it?—The effect is that they do so now; but I would let them do the work without first calling upon the individual owners to do it, because I say that the effect of their calling upon them, if they did it, would be only a piece of patchwork; but they never will effectually do it in sewers, I never knew an instance of it; and with regard to roads not one case out of 500. The effect therefore of serving those notices is simply to give the parties a loophole for escape under some technicality or another.

1704. You would do the work without giving any notice, but merely charging the parties when it is done?—Yes. I would, if it was necessary, have a notice put up, or an advertisement, and let any person who chooses object to it, giving him some period during which he might appeal to the justices to show that it ought not to be done.

1705. (*Mr. Hibbert.*) You were suggesting that the rate should be paid out of the poor rates; would not there be a difficulty in that, in this way, that under the Local Government Act you assess a smaller amount upon agricultural land, and, therefore, if you pay it out of the poor rate you would be taking it upon the full assessment; how would you meet that?—That is easily met in practice by the parish officials putting one fresh column in their book, as we do.

1706. Would not it be necessary to make a separate collection of the rate?—No.

1707. How would it be paid out of the poor rates?—When I say paid out of the poor rate, perhaps the words are not strictly accurate. It would not be paid out of the poor rates, but the collectors would collect it at the same time as the poor rate. It would be simply to introduce that one column to meet the objection.

1708. The poor rate collector would collect it for the local board?—He would collect it for the overseer, and the overseer would hand over to the board the amount of money. It is the plan which is adopted in Islington and many other metropolitan places.

1709. I understand you to suggest that it should be collected by the poor rate collector?—Yes, to save all this amount of needless and useless expense of labour; but not having my attention at the particular moment drawn to the latter question, why I think we could get rid of one-fourth of this process I have not explained how it is carried out; but it is carried out in practice, and it is extremely simple.

1710. Will you explain exactly how you would carry it out?—Take a case in the metropolitan districts adjoining our own, namely, Poplar and Bow. In both of those cases you find there are different boards of works, but their practice is the same. When they require money they make an estimate of what they require, and then instead of directing their functionaries to levy a rate themselves, they send a *precept*, stating how much they want, to the parish officials, and the parish officials raise that amount for them and hand over to them the money.

1711. But do they raise that amount upon a separate assessment, or upon the same assessment as the poor rate?—Upon the same books; but not having had to fight them I cannot say what the particular form is, except that I know that they have a separate column when they make the demand for that amount, stating that the collector called for so much for the poor rate, being an assessment of say 1*s.* in the pound for the poor, and also for the general district rate of 3*d.* or 4*d.* in the pound, as the case may be; and also there is the same column in their receipts.

1712. Do you really mean that the poor rate collector should collect the rate for you?—Yes, undoubtedly.

1713. But not that it should be paid out of the poor rate?—Not that it should be paid out of the particular sum raised, but that it should be always collectable at the same time; therefore, when the collector goes round he goes round for both, and he gives the receipt in the usual form.

1714. Supposing that the collector were to collect both the poor rate and the district rate, would both rates have to be approved by the justices?—No, ours are not approved by the justices. The board makes them, and the board is perfectly arbitrary in this matter. For instance, this rate book has never been approved by the magistrates at all. It is not necessary with the district rates. It is expressly provided that it should not be.

1715. Here is a paper showing the mode in which the rates are collected in Marylebone (*handing a paper to the witness*). Is that similar to what you suggest for West Ham?—Yes; the board here instead of making rates for itself issue a *precept* to the parish officers requiring so much money, leaving them to collect it in the same way and upon the same principles as I have suggested.

1716. (*Lieut.-Col. Ewart.*) With regard to your suggestion about the question of the inhabitants making good the portion of street and the portion of sewer in front of their own houses, if your suggestion were carried out you would still leave the inhabitants to make their house connexions, would you not?—Yes, that is not affected by the system at all, they still have to do it. The inhabitant of each house, or the owner, still has to make his connexion with the sewer, but the section in question refers to making the trunk sewer down the street.

1717. You would not alter the system of each

house making its own house connexions?—No, not at all; it would be quite needless to alter that.

1718. How would you propose to assess the proportion that they should pay?—That must be as at present, so long as the duty is cast upon the surveyor, after the work is done, of estimating the cost and apportioning it amongst the various owners. But there is one other practical difficulty in connexion with that. The Act expressly says that the surveyor, in apportioning the expenses, is to do so including the portion at the intersection of streets, and a large portion intersects cross streets where there is no house exactly abutting upon the sewer. If nobody does that portion of the street it, of course, will be for the surveyor to apportion the expense in making it among the whole; but if this man does his little bit of work, and that man does his little bit of work, he has done all that the law requires that he should do, and when the surveyor therefore goes to apportion the expense of that intersection of the street, he is of necessity compelled to throw it upon the man who has not done the work; and the other man gets scot free, because he has done what the law requires of him. The general form of the notice is given in the Local Government Act. You require him to make good the road in front of his own house; he does it, and then the surveyor is left to apportion the expense of the intersection, and you do not call upon each to do anything towards the point of intersection of the street. Then, supposing that one half of the people do the work, and the other half do not do their part, the surveyor is of necessity called upon to apportion the cost of making good the roads at the intersection of streets, among those who have not done the work.

1719. You would do the work, throw the expense on the rates, and leave the house connexions to be made by the individual owners?—Not throwing it upon the rates. I would still lay it upon the owners; but I would never give the owners, in the first instance, an opportunity of doing it themselves, because if they do it, it is the most prejudicial thing that can happen. They cannot do it as cheaply as any public body, a hundred men each employing his own men to do his share.

1720. You would have to assess it, would you not, according to the frontage?—Yes, quite so, as at present. I only propose to abolish the opportunity which is, practically, seldom made use of, of giving the parties the option of doing it in this patchwork form themselves.

1721. (*Dr. Acland.*) Are we to understand that those difficulties would occur in all the districts in London?—I apprehend that they would; but in few parishes to such an enormous extent as in ours. We have that enormous district called London over the border, known by the name of Canning Town, and we have had all those roads to make up, and the amount of labour has been fearful in getting back the money.

1722. (*Mr. Lambert.*) With regard to the rates which you spoke of just now, on what basis are they made; are they made upon the same basis as the poor rate?—Upon the same basis as that assessment; indeed, we are expressly directed to follow the poor rate; but all land of railroads and some other properties and land covered with water, is only rateable at one-fourth of what other property is.

1723. Then do you, in point of fact, adopt the poor rate valuation for the purpose of your assessment?—We do. We are directed by an express clause in the Public Health Act to do so; but there is a provision that if the board think that the assessment by the poor law officials is not a correct one, the board are enabled to amend it; but in practice we never do that, we follow the poor rate assessment.

1724. If persons are dissatisfied with your assessments, to what tribunal do they appeal?—They simply come to us, and, as a matter of practice, we say that whatever the overseers will do we will do; that is the view adopted in the statute, the law clearly contemplates that there shall be only one assessment.

1725. Is there any appeal to the sessions from your assessment?—Yes, the same as for the poor rate.

1726. Have you known persons avail themselves of that power?—Never; because in fact we have never given them occasion. What we have said is, if the poor law officials will alter it, whatever they do we will do. The only case that we ever had of an appeal to the sessions with regard to our rate, which was a very large one, was from the London and Victoria Dock Company; but it affected a question that could not arise under the poor rate upon this very question of valuation which we are speaking of. It was a nice and intricate question. Assuming the Victoria Dock Company to be properly rated at 16,000*l.* a year, which they were to the poor rate, it being land covered with water, how much of those profits were deriveable from land covered with water. It was a very nice point, and we were about five or six years about it, and could not get anybody to tell us. Of course the dock company told us immediately that out of the 16,000*l.* 15,900*l.* and some odd money was derived from the water, and that the only profit got from their enormous warehouses was some 97*l.*

1727. There is power to compound for rates with you, is there not?—Yes, we have the same power as existed under the poor law till lately.

1728. Do you exercise that power?—Yes, we have exercised that power.

1729. In the same manner as the overseers have done?—Yes, precisely the same; we follow entirely in the wake of the overseers.

1730. What you propose is a separate assessment column for your rate in the rate book?—Yes.

1731. With a collecting column?—Yes.

1732. You would propose to make use of the same rate and receipt book as they do in London?—I would propose to adopt the same mode as in the case to which my attention has been called. Never having been in office in any one of those districts, I am not able to say whether that particular mode works well or not. I know nothing against it, and those who have to do with it tell me that it works very well.

1733. It would be necessary to make the two rates at the same time, would it not?—It would be very desirable, because, as will be seen, the number of people in those large parishes is enormous.

1734. You have mentioned another authority in your district, a sewer authority?—They are scarcely the sewer authority for the town; it is not a sewer for sanitary purposes; they have the surface drainage of the valley of the Lee.

1735. Do they act under a local Act?—No, under the old Commissions of Sewers.

1736. The district over which they exercise jurisdiction is much larger than your district?—Yes, very much larger.

1737. Are you able to say how much?—In point of area it is three times as large, because the very name implies that they go down to Dagenham and Havering Bower, which is 14 miles from London, and therefore they must include the whole of that area.

1738. I think I understood that their jurisdiction was with regard to surface drainage only?—Yes, that is so.

1739. Do they exercise that authority?—Yes.

1740. Have you ever come in conflict with them?—Yes, we are rather so at this moment. Our district is rapidly losing the character of an agricultural district, and becoming swarming, in fact, with manufactories and small houses, which spring up after manufactories; therefore land which was only arable land a year ago is now covered with small houses. The effect of it is, that ditches which are under the control of the Havering and Dagenham Commissioners for the purposes of surface drainage, and for the purposes of marsh land, and so on, for cattle, immediately houses get into the neighbourhood of course become nuisances. We do get into conflict. We say it is the fault of their system, and I am sorry to say that they retort and say it is the fault of ours.

1741. And between the two very little is done?—No, I cannot say that.

1742. Who does the work of the two?—I do not go down personally to see, but I know that our people are so thoroughly looked after, that I do not think there is any default on their part.

1743. Am I to understand that your people do the work which the Commissioners of Sewers ought to do?—The Havering and Dagenham Commissioners of Sewers say that they have nothing to do with nuisances, that that is not their business, and that the nuisances arise from our people not looking after them.

1744. Practically such a double jurisdiction is inconvenient?—It is inconvenient, but I do not know how in this instance it can be got rid of consistently with the duties which those Commissioners have for such a large area. They would be perfectly willing that we should be cut off, and that the whole of the sewers control in our place should be vested in us, if it were not that if our people failed to do their duty it would affect the whole district with regard to letting in water from the Thames and looking after the river banks, which are part of their jurisdiction.

1745. But supposing that they had the power to require you to do the work, would you see any objection to it?—I know it would be very unpleasant to our board. Perhaps I have not sufficiently called attention to the fact that three members of their body sit upon our board as delegated members to look after their own interests.

1746. *Ex-officio?*—Yes.

1747. Under their Act?—Under an order in Council, and a further Act of Parliament incorporating that order.

1748. In your Act are there special provisions to meet their case?—Yes, as far as the delegation of three members at that board who sit as members of our board.

1749. Do those Commissioners of Sewers levy a rate over all the district?—Yes.

1750. Do they make a separate assessment or not?—I do not know at all.

1751. Have you paid it yourself?—Yes.

1752. Have you paid it to the same collector?—Not to our collector, but to a collector appointed by the Board of Commissioners.

1753. They would make a separate rate themselves, would they?—Yes, they would make a separate rate themselves entirely over the whole district.

1754. There are, in fact, for sanitary and drainage purposes, two distinct bodies over your district?—I would say that they were not for sanitary purposes at all; their appointment is a very old one; certainly long anterior to anything like the passing of the Sanitary Act; it is for surface drainage purposes and to protect the banks of the river Thames and the banks of the river Lee, and keep back the water.

1755. Do you yourself see any objection to giving them the power of requiring you to do the necessary works of surface drainage, and in default of your doing it, that they themselves should do it?—No, I see no objection to it.

1756. (*Mr. Bircham.*) You had considerable experience in 1867 of the epidemic in your district?—Yes, we had.

1757. Did that bring under your notice any defects in the working of the Public Health Acts?—No, except this, that at that time the body specially appointed were the guardians, and that brought us a little into not hostile contact with them, but there were awkard questions arising as to jurisdiction. We set our men, for instance, at work, and we got as our inspectors appointed by the guardians some of their officials, in order to justify them in taking the steps which that legislation provided for, such as going into houses and rapidly burning affected things.

1758. Then there was some conflict of authority between your body and some other body at work in the district as to what was necessary to be done with reference to the public health?—Undoubtedly in the sense that one body had certain powers, and another body had certain other powers, but there was no conflict in the sense of being in opposition, because both bodies acted very harmoniously together.

1759. Have you anything to suggest which would induce greater convenience in the working out of those matters?—I think I might, but I should say that I did not know one word about giving evidence before this Commission until about 10 days ago. There were a great many thoughts that flitted across one's mind occasionally, but I have not had the opportunity of putting them into any shape.

1760. Have you a great many small tenements in your district?—Yes, a great many.

1761. And a great many not receiving an adequate water supply?—I fear that is so; but then we have great complaints to make against the East London Waterworks Company. We are constantly at issue with them.

1762. Have you any experience of the working of the 75th section of the Public Health Act, which gives the local board power to require houses to be supplied with water?—No. We have thought of it several times, but our rates are so heavy at present that we have always been frightened at the idea. It has been suggested to bring the Grays water to our place.

1763. I wanted rather to call your attention to this, whether there was anything defective in that section which you could suggest the amendment of?—That is a point which has not been brought under my notice, and I could not off-hand give an opinion upon it. I may say one thing certainly which has been brought under my notice in connexion with it. The Board of Health has the power, where a supply can be obtained not exceeding 2*d.* a week, to order the owner of the premises to have it laid on; but it is much like the case of roads. We have to give him notice to do it, and if he does not do it we have to do it at the public cost with the chance of recovering it from them. There ought to be the power given, I think, as we now have by our Local Act taken from the Metropolis Act, that in case the owner does not do it we should summon him before a magistrate, who should inflict a penalty upon him for not doing it. Our only remedy at present is to do it ourselves, and then look to a man who may turn out to be practically a pauper to recoup us for improving the man's own property.

1764. Have you been brought in contact with cases where houses unfit for human habitation are inhabited?—A few, not many.

1765. Is it your opinion that any inspection with a view to the licensing of houses before they are inhabited would be useful?—We have that practically now under our byelaw; it is not in the general law, but we have a byelaw.

1766. How does the byelaw affect that?—A certificate by the surveyor is necessary before any house can be occupied, and if any house be in occupation and it is reported by the medical officer or the surveyor to be unfit for human habitation, we then can give notice requiring it to be closed, and that any person occupying it after a given time is liable to penalties.

1767. Is there a penalty upon the occupier?—It is a penalty upon the occupier for occupying, as well as on the owner for letting.

1768. Do you think that any legislation to prevent the recovery of rent in cases of houses certified to be unfit for human habitation would be salutary?—In a measure it would, because of course it would be the interest of the landlord, who at the present moment is not very desirous to get rid of his tenants; we have found in the case of cholera a great difficulty in getting rid of tenants.

1769. (*Mr. Powell.*) You spoke of the Commission of Sewers; can you inform us what was the origin of that commission?—No; but I know that it is certainly an ancient one. I cannot give any information of a reliable character upon it.

1770. What is the date of your Local Act?—1867.

1771. Can you inform us whether there is in your

district a considerable attachment to that Local Act, and a corresponding reluctance to fall under the general Act of Parliament dealing with sanitary matters?—Perhaps I have rather over-stated the character of our Local Act; it was only an Act for the purpose of getting rid of certain technical difficulties for the erection of a town hall; and also we then took an opportunity of getting a few of the clauses of the Metropolitan Act incorporated with our own Act.

1772. The byelaws to which you made reference were simply under those clauses?—Under those clauses simply.

1773. Have you found any difficulty in the working of the local authority from your near neighbourhood to the district of the metropolitan board, you yourselves being outside the board?—No.

1774. You were anxious to be taken into the main drainage system, were you not?—We were placed in a very considerable dilemna last year, and to get taken into that system in one degree tended to relieve us. We were therefore anxious that we should be taken into that system simply because it got rid of still greater difficulties. I believe now it will be thought perhaps to be the most economical mode, but they have always repudiated it, and have told us that their system was not large enough for themselves.

1775. Did you go so far as to bring in an Act of Parliament with a view to being admitted to that system, or did you only make application to them?—We have only made application to them.

1776. One part of your district is called Silvertown, is it not?—Yes.

1777. Did not that locality make some effort last session to be separated from you?—Yes, they did. They had applied to us to drain them for a long time, but our difficulty lay in the fact, that in order to do so we should have had to have brought their drainage at a cost of at least 10,000*l.* to our present pumping station on the river Lee. We practically had got notice to quit that station, and we therefore said to those people it is great folly our expending that 10,000*l.* in draining your district, because, for aught we know, we may be compelled to remove our pumping station, and the pumping station may be removed very near to your district; we, therefore, want you to wait a year or two until that question is practically settled, and then we will drain you. The people would have waited willingly, but there were a variety of building societies who had purchased up the land, which was rather swampy, and who could not get it drained without our draining it, to whom it was therefore of great importance to get an Act passed as speedily as possible, perfectly reckless as to whether it cost 10,000*l.* or 20,000*l.*, and they were the promoters of that scheme.

1778. Was that a scheme to discharge their sewerage into the Thames at Barking Creek?—Their scheme was to enable them to unite with North Woolwich, and to have a scheme of drainage of their own.

1779. You had a strong objection to that part of your district which paid you a considerable amount of rate being separated from you?—Exactly.

1780. And you opposed their Bill in Parliament?—Yes, we opposed their Bill in Parliament.

1781. And was the expense of that opposition charged upon the local rate?—Yes.

1782. Should you be of the opinion which has been expressed by previous witnesses, that before a district goes to Parliament to get powers of that exceptional character it should have the consent of the Secretary of State?—I certainly should; but in this particular instance I should mention that they did go before Mr. Gathorne Hardy under the 49th section of the Sanitary Act of 1856 to enable them to be constituted a sanitary district, and Mr. Gathorne Hardy told them that they had not made out their case, upon which they went to Parliament for a Bill, which was referred to a committee, of which you were the chairman. We were united so far as our interest was concerned, but the committee introduced clauses into that Bill enabling us to continue on our then pumping station on the banks of the Lee, provided we clarified the discharged sewage. The effect of this was so great a benefit to to us, that we immediately gave an undertaking to drain Silvertown, and we are now in progress of carrying it out. There was one difficulty, that if the committee had passed that Bill in the shape in which it was introduced, the effect of it would have been to have removed the pumping station at West Ham entirely somewhere further down, in which case we should have taken Silvertown on our way; so that until the question was settled we might be incurring an expenditure of 10,000*l.* for draining Silvertown in this way, when within a year or two afterwards we should have wanted to have gone the other way. That was our objection.

1783. (*Mr. Cave.*) Do you pump now into the Lee?—Yes, we pump into the Lee.

1784. At the end of two years you will have to clarify your sewage, will you not?—At the end of two years after receiving notice.

1785. Will you state a little more distinctly the amendment which you propose in the law with regard to water supply?—It was merely as to a point of detail. I was asked whether I had any suggestion to make upon the subject, but it was not a point to which I had addressed my attention before coming here, and one suggestion only occurred to me, which was to alter the law in that particular respect, namely, that at present where water can be supplied at a price not exceeding 2*d.* a week the board can call upon the landlord to have that supply laid on; but if he makes default, all that the board can do is to do the works for him and charge him with them; but frequently in the case of this small property the owner is a poor man himself, so that in fact the money of the ratepayers has been expended in improving his property. The provision which I would seek to apply is this, that if the owner does not comply with the order I would have him summoned before the magistrates, and give them the power to impose penalties, and not that the parish should improve his property at their own expense.

1786. How would that affect the object of getting a water supply?—Inasmuch as the owner being subject to penalties if he did not lay on the water, he would lay it on for fear of those penalties.

1787. Do not you start with the idea that he is insolvent and incapable of doing it?—No, I do not start with that idea; but I know that very often in those cases he may not be so poor, but we cannot get hold of him; we have a difficulty in finding him, and a difficulty in serving him with those notices and in getting the money from him.

1788. Would not that same difficulty arise with regard to the penalty?—No; we have found that very often when people are compelled to do a thing under a penalty they do it, when they would not do do it if the only consequence was that we had to do it for them; they would leave us to do it for them, and would take the chance of being afterwards compelled to recoup us.

The witness withdrew.

Adjourned to Monday the 31st instant at 1 o'clock.

Monday, 31st May 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The Right Hon. LORD ROBERT MONTAGU, M.P.
The Right Hon. STEPHEN CAVE, M.P.
Sir THOMAS WATSON, BART., M.D., F.R.S.
Lieut.-Colonel EWART, R.E.
SAMUEL WHITBREAD, Esq., M.P.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
JAMES PAGET, Esq., F.R.S.
HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
FRANCIS THOMAS BIRCHAM, Esq.

J. Simon, Esq., F.R.S.

31 May 1869.

(11.) JOHN SIMON, Esq., F.R.S., examined.

1789. (*Chairman.*) Will you state what your present office is?—I am medical officer of the Privy Council.

1790. How long have you been so?—I have been in that office since 1858, when by an Act of Parliament, for which you, sir, were particularly responsible, I was transferred from the then expiring Board of Health, with which board I had been connected for the three previous years, having been appointed to the Board of Health in 1855.

1791. Whom did you succeed in the Board of Health?—There had previously been no such official.

1792. You were the first government medical officer, both under the Board of Health and subsequently under the Privy Council?—I was; but, perhaps, to prevent a misunderstanding, I should say that for a part of the duration of the general board of health, though there was no person holding an office similar to mine, there was a medical member of the board, Dr. Southwood Smith.

1793. Did he cease to be so when you took your office?—He ceased at least a year before I took office. I think in 1854.

1794. Will you state generally what changes your office has undergone?—There was a period of four years during which the Board of Health was moribund. In 1854 the constitution of the Board of Health was altered, and the responsibility to Parliament for the proceedings of the Board was vested in a President. In 1855, as I have stated, I was appointed under the new constitution. The first President of the Board of Health was Sir Benjamin Hall. The office was filled by Mr. Monsell, and afterwards held, as an unsalaried office, in conjunction with the Vice-Presidency of the Education Office. Mr. Cowper holding the latter office, held also the presidency of the Board of Health, without salary, and that led the way to the transfer of my office to the Privy Council, which was made in 1858. At first Parliament probably had not quite made up its mind whether there should be any permanent arrangement for the supervision of public health, and the Act of 1858 was a temporary Act, but in 1859 it was made permanent. Then I worked on until 1861 without change, but in 1861 Lord Granville and Mr. Lowe, who had then been two years in office, thought it desirable that the work should be thus far changed, that I should become their administrative officer for health purposes. They passed a minute for that purpose, and I have been acting consequently for the last eight years in a considerably larger sense than was anticipated when I took office in 1855, or when the office was changed in 1858.

1795. When that change took place, making you an administrative officer, did it enlarge your functions?—Very much indeed; that is to say, I have been acting as secretarial officer in addition to acting purely medically.

1796. In that change you retained all your former functions with new ones added?—Yes.

1797. Except that by the Act of 1858 the expiring Board of Health's functions were transferred to the Council, is there any other reason that makes the Privy Council a suitable office for your functions?—I suppose one office would do as well as another, and provided that the subject matter gets well represented in Parliament, it scarcely matters whether it is in one or in another of the other offices that have to do with home affairs. But perhaps there was this special reason for the transfer to the Council Office, that the Council Office had in old times been supposed to look after the public health and was the quarantine authority.

1798. Do you suppose that the reason of that was that proceedings relating to quarantine are generally done by Order in Council?—Yes, I suppose that must have been the reason.

1799. You know no other reason to make the Privy Council a specially good office for your functions?—No. At the time there was a belief that the Home Office was too over-burthened to undertake it.

1800. Do you act in conjunction now in any way with the local government department of the Home Office?—In no regular way. I am of course frequently in communication with the Local Government Act Office, and on other Home Office business papers are occasionally referred to me.

1801. Do you mean in case of epidemics?—No, the Home Office has nothing to do with epidemics.

1802. What sort of papers are referred to you by the Home Office?—For instance, I have on my table, at the present moment, a paper, referred to me from the Home Office, on the question of the constitution of the general council of medical education.

1803. In fact, I suppose Bills which are originated in the Home Office, if they refer to medical subjects, are referred to you?—Latterly that has been so.

1804. Have you any inspectors under your orders?—First there are inspectors whom I may in short call vaccination inspectors, as employed almost exclusively in vaccination. I do not call them exclusively vaccination inspectors, because it is part of the understanding of the office that if they are wanted for any other purpose they shall be utilised for that other purpose; but in point of fact they are employed very nearly exclusively with reference to public vaccination, except that the senior of them, Dr. Seaton, acts for me in my absence. Then, there are, secondly, two inspectors for general sanitary purposes, who have nothing to do with vaccination; and there is an inspector of the lymph supply of the Vaccine Establishment.

1805. What total number of inspectors does that make?—Seven. There are two general sanitary inspectors, Dr. Buchanan and Mr. Radcliffe. The inspectors specially for vaccination are Dr. Seaton, Dr. Stevens, Dr. Wiltshire, Dr. Hunter, and Mr. Wagstaffe; but the last two give only half time, so that you might add them up and they become only one inspector; thus we may say four inspectors for vaccination; besides whom there is the inspector of the National Vaccine Establishment, Mr. Tomkins; and there are the two general sanitary inspectors.

1806. Are all of your inspectors medical men?—Yes; all of them.

1807. Have you any occasion from time to time to use in any way the inspectors of the Local Government Office in investigations?—Not often; our provinces of work are very distinct, and it is rarely that a case arises for concurrent action.

1808. The distinction generally is that yours are medical inspectors and theirs are either engineering inspectors or inspectors for general purposes?—Engineering essentially.

1809. Will you state what you consider are the faults of the present system of Sanitary Law and

administration?—There are faults of incompleteness, but they are small faults in comparison with the faults of confusion. The state of the law, in relation especially to local authorities, is chaotic.

1810. Will you state in what instances the law is so confused?—On the most favourable construction of the law at present, I suppose we may say that in all country districts there is one authority for every privy, and another authority for every pigsty; but I also apprehend, that, with regard to the privy, one authority is expected to prevent its being a nuisance, and the other to require it to be put to rights if it is a nuisance.

1811. What are the two authorities that you allude to?—The vestry for the privy and the guardians for the pigsty.

1812. The one being under the Nuisances Removal Act and the other under the Local Government Act?—Certainly the pigsty is under the Nuisances Removal Act; of that there is no doubt; and then the privy is to some extent, but, as I read the law, not entirely, put under the vestry by the Sanitary Amendment Act of last Session.

1813. Can you give us any other instances of the confusion of the law?—Perhaps if I read a letter that I received from Watlington this morning it may illustrate the case. Watlington is in the Henley Union. We had to inspect it on account of complaints made of danger to public health, and the local sanitary administration was about as bad as anything could be. A vestry meeting had to be called, it being a question whether proper drainage and proper water supply were required; but the anterior difficulties were considerable. We wrote but got no answer. We wrote, of course, to the vestry clerk, and we presently found that there was no vestry clerk; then we addressed a letter to the vicar, and at last the vicar got a meeting, and here is his answer.

1814. Will you first state under what Act you made those inquiries?—Under the Public Health Act of 1858, the 21st and 22nd of Victoria, chapter 97, the Privy Council may cause to be made, if they see fit, inquiries upon any matter concerning the public health. Here is the vicar's letter:—"Objections were raised by Mr. Viret and Mr. W. Wiggins as to the meeting being a vestry within the meaning of the Acts of Parliament, which were answered by Mr. Gover from a circular issued by the Poor Law Guardians, bearing upon the subject. After much discussion it was moved by Mr. Viret, and seconded by Mr. W. Wiggins, 'That all the correspondence and papers, including Mr. Gover's letter to the Privy Council, be 'referred to the Board of Guardians at Henley, as 'the sanitary authority for the parish of Watlington under the existing laws, with a request that 'the Board will call upon their Medical Officer and 'the Inspector of Nuisances to inquire into and 'to report upon the matters complained of.' An amendment was moved by Mr. Gover, 'That a 'committee of twelve ratepayers be appointed to 'carry out the duties of the vestry as a sewer 'authority;' but no member offering to second this amendment it was not put to the meeting. The original motion was then put and carried. In explanation of the above account, I must add that Mr. Viret, who is a magistrate and *ex-officio* member of the Henley Board of Guardians, stated to the vestry that he was himself in communication with your office, and had been informed therefrom that the guardians were the proper authority to act, or something to that effect," (we had stated the contrary,) "and in presence of this seeming conflict of authorities it was difficult for the vestry to know how to proceed. The great majority of those present did not vote at all upon the question. Under the circumstances I am myself perplexed as to whether it is my duty to carry out the intention of the resolution passed by the vestry." That is a paper which came in this morning, but we have been constantly having before us cases of this sort, more or less illustrating the chaos. We are asked questions which we are totally unable to answer, as to what are the limits of duty of the two authorities.

1815. The Act you refer to under which this correspondence proceeded was an Act which gives power generally to the Privy Council for sanitary purposes, and transfers to them the powers of the Public Health Board which expired that year?—Yes.

1816. Is there nothing in the Public Health Act which would make it clear what was the local authority responsible in that case?—Under Mr. Lowe's Nuisance Act of 1860 the board of guardians was made the universal nuisance authority of last resort, namely, the authority, in all places which were not special health districts, with local boards of health, or municipal bodies; but then in 1865 there was started a new authority, a sewer authority, distinct from the nuisance authority, and that sewer authority was to be the vestry. Some uncertainty of jurisdiction was probably inherent even in 1865 in the creation of the new sanitary local authority, though this did not reach its climax at once; but after a while further legislation completed the difficulty by giving to the new sewer authority nuisance functions superadded to its constructing functions. In addition to being the authority for sewers and water supply it was made by the Act of last session the nuisance authority to a certain extent—I can not understand to what extent, but to a certain extent, for privies. And that is the position in which matters now stand.

1817. Am I not right in saying that under the Act of 1858, there would, in country districts, have been no authority, but that authorities have been created by the Nuisance Removal Act, and under the two Acts, of 1860 and 1865, which alone have created any authority at all in a country district, and have produced a conflicting authority?—The confusion culminated under the Act which vested a certain quantity of nuisance authority in the vestry. That Act was the Act of last session; but some confusion may have begun as far back as 1865, when the duplicate authority was first created.

1818. Was not the confusion to which you allude created by the Acts subsequent to 1858?—Yes.

1819. And at the time when that Act of 1858 was passed there could have been no dispute whatever?—None.

1820. So that the confusion in this case has arisen from the multiplicity of Acts which have been passed since?—Yes.

1821. Is there any other signal instance of the conflict either of law or of authority which you would wish to state to the commission?—There are many difficulties in the law, which no doubt would be better put before the commission by a lawyer than by me. For instance, it is difficult to know who are the local authorities in parts of parishes when other part is under the Local Government or the Public Health Act.

1822. Do you refer to combined districts?—No, not to combined districts.

1823. Do you mean where the district takes in a town and a portion of the country round?—Where a parish is in part under the Local Government Act, but in another part is not under it.

1824. Have you formed any definite opinion yourself generally as to which is the best rural sanitary authority, the board of guardians or the vestry?—That question seems to have been to some extent answered by experiment. We began with parish authorities; the Act of 1855 had parish authorities, and they slipped through the fingers, you could never catch them; and then in 1860, under Mr. Lowe's Act, the law was altered to make the board of guardians the local authority for places that had not special health districts. That was a tangible and permanent authority, an authority that had a clerk, that had a regular place of meeting, that had medical officers and so forth, and it was felt to be a great gain. Under the parish system it had been obligatory that every parish should appoint a sanitary inspector, but this obligation

had remained a mere dead letter, and when the House of Commons ordered a return as to how many parishes had appointed sanitary inspectors it appeared doubtful whether a large number of parishes had even heard of the law, or had any notion of its existence. A large proportion of them did not answer the circular at all, and all appeal from the Government to them was so much shooting in the air.

1825. Is it your opinion that for two reasons the board of guardians is preferable to the vestry; one, that it is a more definite body, and secondly, that it represents a larger area and is therefore more likely to be cognizant of the law, though both are corporations for this purpose under the 29 & 30 Vict. c. 90. s. 46?—Its covering a larger area is perhaps in itself a disadvantage. If you could hope that the parish authority would be really a tangible authority, I should say that there was an advantage, for many purposes, in the smaller area; but I am afraid that that is hopeless, and if hopeless then I think clearly that what one must aim at is to get the board of guardians (subject to the very important qualification which I will state directly) to be the local authority; but its power of acting through committees would require very great development I think, and to be very well considered and made very complete. But I said that there was a qualification which I would ask to put in as regards the board of guardians being the sanitary authority, and it is this: that the board of guardians should not be that authority *ex officio*. I think it a great misfortune to have so very important an interest as that of health administered *ex officio* by people who are appointed for other duties. And if it is the opinion of the Commission that the board of guardians should be the common authority for health purposes where there are not special health districts, I would suggest that their constitution as a board should be for all purposes of local government; that they should not be elected as a board of guardians and act *ex officio* for health; but that their election should be as a compound board for health and poor law relief.

1826. When you use the word *ex officio* you are not alluding to the *ex officio* members of the board, but you think that the board being elected for one purpose, namely, the administration of the poor law, are not therefore fit for another purpose, namely, the superintendence of the laws of health?—They may be quite fit for it, but they are not elected for that purpose, and I think that the purpose of health ought to be contemplated in their election, and that they ought not to be able to say, as boards of guardians over and over again have said "We are not elected for these "health affairs; we do not know anything about them. "We are elected for something quite different, and "it is very hard that this should be thrust upon us in "addition to our primary duties." And what I would aim at, if a board of that sort is to act for health, is, that it should be part of its original appointment so to act.

1827. You have very strong views, have you not, as to the importance of a central authority in London?—Yes, I have the strongest views about that.

1828. Will you state to the Commission first your opinion as to any intermediate authority being constituted between those boards of guardians and other local boards, and the central authority in London?—I do not think that there should be any intermediate authority. I think it quite possible that for certain health purposes, other than those of the Nuisance Law, there should be a different class of authorities. We have a local authority for lunacy in the magistrates, and it is quite possible that that same authority might advantageously act for some special health purposes, and also where the administration is to be over a larger area than that of unions. It is possible, for example, that they might be the best authorities for a good many commercial interests of health which require to be attended to. But for the administration of the Nuisance Law as it is, or in the more developed form which I hope it will take, it seems to me that there ought to be no successive local authorities, that there should be but the one responsible local authority and the central government authority to look after it.

1829. It has been suggested to the Commission that the county financial boards which are in process of formation, the Bill being before Parliament, which would be partly an elective and partly an official body, might be a useful intervening authority between the local boards and the office in London, but you are decidedly of opinion that no such intermediate authority is necessary?—Very strongly; it would be a mere buffer, and you want to act as directly as you can if you are at all.

1830. Will you describe what you think the central organization should be, which, according to your views, would be able to preside over all the kingdom, and yet be efficient in each locality?—The central organization would involve that the minister should thoroughly know the state of health in all parts of the country.

1831. By the minister do you mean the Home Secretary of State?—What minister is to have charge of the matter, is, perhaps, a separate question, but the minister, whoever he is, should be in possession of knowledge scientifically and properly interpreted as to the facts of health and disease throughout the country. We are a long way from that at present.

1832. Do you mean that he should be informed by means of a body of inspectors?—Not in the first instance by inspectors. Inspectors would in certain cases be necessary, but first of all he should have before him returns. We have at present returns which are very admirable to a certain extent. Although there are deficiencies which I will refer to, there is an admirable organization for returns of death under the Registrar General; but we have no returns of sickness. Then the returns of death made to the Registrar General are necessarily imperfect. The law does not provide that the cause of death shall be medically certified, and in consequence of that defect of the law all sorts of cock and bull stories are told about the causes of death. We had to make an inquiry on one occasion as to the supposed very large prevalence of phthisis in some of the South Wales counties. We had been inquiring about phthisis in many parts of the country, and had been able often to trace its prevalence to particular industries; and since then we have been able to trace a good deal of the local prevalence of phthisis to the influence of soils; but on this occasion we were told that there were no particular local influences which we could suppose to be concerned in producing phthisis. An inquiry was made, and it turned out, that this great appearance of phthisis in the death registers depended upon the fact, that the causes of death were only exceptionally certified by medical men. I remember that in one case only 15 per cent. of the deaths had been medically certified. The non-medical certifiers of death thought that "consumption" was a good word to cover death generally, so that any one who died somewhat slowly was put down as dying of "consumption," and this appeared in the Registrar General's returns as phthisis.

1833. Do you think that the Secretary of State would be equally able to enforce other sanitary laws of local government, as well as those specially relating to medical subjects? By other sanitary laws I mean such as nuisance removal, smoke consumption, and all the various subjects which are under the local government office?—I think that the administration of the nuisance law in the largest sense of a nuisance law, and including everything that you could properly call a nuisance, might properly be with him, if he were medically advised.

1834. Is your proposition in fact to revive the old Board of Health?—No.

1835. What would be the distinction between the central authority, which you propose, and the old Board of Health?—It seems to me that there must be a medical department like the one that I have to look

after; a separate department of which the chief officer is medical, acting as superintendent general for health; acting immediately under the minister, to whom he is responsible, whichever minister it is, whether the heads of the council office or the Home Secretary; not fused with any other office. You may remember that in the old Board of Health the engineers to a considerable extent dealt with matters of medical opinion; there was very little medical inspection, except in times of epidemics.

1836. When you recommend one central consolidation of authority, and also deprecate any intermediate bodies, in both those recommendations you are principally referring, are you not, to medical subjects, and not to all local government powers?—As regards the locality I think there should be a consolidation, and I think that all improvement powers relative to health should be in the hands of the nuisance authority. I think it would be well if all local government whatever could be in one local authority, but I suppose that is not to be expected at present. I suppose that in towns at present the destitution authority is likely to continue separate from the local improvement authority, but the local improvement authority ought, I think, to have in its own locality all improvement powers; that is to say, it ought to have the burials, the baths and washhouses, the lodging houses, the labourers' dwellings, the sewers, &c., as well as the removal of nuisances; all those matters ought, I think, to be under the one local improvement authority; and, as I said, I should think it still better if the local improvement authority could be the destitution authority, but that may not be very likely. Then as regards the centre, I think that one chief ministry, either the Home Secretary or the Privy Council, should have under it all those subjects in their largest sense, and that there should not be, as there is at present, a division of sanitary responsibilities between the Home Secretary, the Privy Council, and the Board of Trade. There is the Board of Trade looking after the water supply of the Metropolis. In times of cholera epidemic, when there is every reason to suppose that the water supply is of the very utmost importance to the lives of thousands and tens of thousands of people, it is not in the Health Office, it is not in the Home Office, it is in the Board of Trade that that interest is supposed to be superintended. I think that both sorts of subject-matter, the subject-matter of the medical department, and the subject-matter of the Local Government Act Office, should be under one minister, but with two separate offices. I suppose that Mr. Tom Taylor's office, the Local Government Act Office, may be developed, and have more matter given to it of the sort that it now deals with; but it would still be essentially a Local Improvement Act Office, an office having to deal with local authorities in respect of construction and finance; that would not blend in the least with the medical work that we do; there is no homogeneity, no similarity of work or of material, between the two offices. But in the medical department there would be the supervision of health, an essentially medical supervision; the supervision of the returns of sickness and mortality, and advising on them; supervision of the administration of the Nuisance Law as tested by its results; the supervision of the working of the Acts relating to epidemics and all preventable diseases, to public vaccination, to commercial offences against health in adulterations of food, and other like offences, to the medical profession, to the practice of pharmacy, &c.; and various other like purposes.

1837. Do you think that one single minister in London would be able to be more than an appeal in such a variety of cases arising all over the kingdom; that is to say, would himself have the means both of being cognizant of all cases where the law was inactive in any parish in the kingdom, and also of enforcing the law where it was inactive?—I think so.

1838. What sort of machinery would he have to enable him to become cognizant of all cases in all the places scattered all over England where the law was inactive, and what machinery would he have to enforce the law when he found it to be so?—I suppose the proper form for the law to take, or the spirit of it, would be that he would interfere with local action only when the necessities of the public health made it necessary that he should interfere. At present the law is unfortunately so worded that he may be appealed to upon any individual dustbin; that of course is not a desirable state of the law, but if the form of the law were that in any case where it seemed to him that the public health was in danger by the maladministration or the nonadministration of the Nuisance Law he could take such and such steps, then the medical superintendent acting under the minister would look after all those matters in detail, and in all extreme cases would bring the matter up to the minister for action.

1839. Is there not a danger on the other hand that he might not be cognizant of the cases at all, and that nobody would bring them before him?—I think it would not be very difficult to organize a system which would enable him to know of all considerable outbreaks of fever. I take that as one case. There ought to be an obligation on the local authorities to report cases of that kind. I believe there is such an obligation with regard to diseases of cattle.

1840. Will you state generally what you think is wanted in the way of reform of the Sanitary Law and its administration?—The Public Health Law in the larger sense of the word has plenty of defects in it, but I believe that the Commission are not intending to go into the Public Health Law altogether. At any rate I confine myself to the Nuisance Law. I want to see it perfected. I think that it wants to be extended to some cases which hitherto have not been effectively dealt with; and that the authority ought to be simplified I have already sufficiently stated.

1841. In what sense do you think the Nuisance Law wants extension?—The pollution of rivers and the obstruction of rivers I think ought both to be made subject to the Nuisance Law. Again I should like to see a number of things that are matter of special legislation and of special prohibition brought into the statutory list of nuisances. For instance, in the Sanitary Act certain exposures of persons with contagious diseases are prohibited, and I would bring cases like that within the word "nuisance." I think a great simplification of the law would be produced if the list of nuisances which now include some half dozen sorts of things should be extended by much further enumeration. As I said the pollution of running water should be made a nuisance, and the injurious obstruction of running water should be made a nuisance, and the exposing of persons contagiously diseased should be made a nuisance. One could enumerate many such cases, but with this restriction; that for at least a large number of such nuisances there should be an appeal. At present trade nuisances admit of appeal. Any one can proceed under the Nuisance Law against a trade nuisance as a common nuisance; but the person proceeded against has the option of appealing to a superior court; and I suppose that that would be a plan on which one could greatly extend the summary jurisdiction power, reserving certain sorts of cases for appeal.

1842. When you say that the pollution of rivers should be added to the subject of the Nuisance Law that would be referring a larger subject to the nuisance authority, or would you extend the authority to meet the larger subject?—I think that the local authorities must have an almost unlimited power of combining, limited only by the sanction which ought to be requisite from the minister; and I think that the minister also ought to have power to enforce combinations for particular purposes. I do not see very well how a good system can work unless the minister has that power of requiring the authorities to combine for certain purposes.

1843. Combining both the areas and of course the authorities and the rating power?—Yes, of course.

J. Simon, Esq., F.R.S.

31 May 1869.

1844. Are there any other new subjects with regard to which you would suggest an extension of the Nuisance Law?—Under the Nuisance Law not any more occurs to me at present; but the Public Health Law generally, looking at it beyond the matter of nuisances, is extremely defective in regard of our unprotectedness against commercial frauds. I should like very much to see the law strengthened in that respect against commercial misbehaviour, especially against water companies; the irresponsibility of water companies for what they do is something abominable Also I should most earnestly wish to see in operation a General Buildings Act, with good sanitary provisions, both as to new buildings, and as to buildings which have become unfit for habitation.

1845. What do you mean by the irresponsibility of water companies?—That if they give us impure water, if they give us sewage polluted water, and in consequence create or greatly increase some epidemic some cholera epidemic, or typhoid fever epidemic, they are virtually unpunishable. Of course, no amount of punishment could make up for the harm done in such cases; and perhaps the mischief ought to be prevented rather than punished; but still, when it is done, one would wish also that it should be punished.

1846. That last suggestion of yours is rather an extension of the law in degree to a subject under it already, is it not?—I doubt if the water companies, except in London, are subject to much law, and the law in London is a very imperfect one.

1847. With regard to the subjects which are already under the law, have you any suggestions as to extended powers, such as the subject of sewage, drainage, the removal of nuisances, the control of buildings, overcrowding, and other subjects?—I think generally the powers are sufficient. If I were going over the list very critically there would probably be some additions that I should make, but generally, I think, the ground is pretty well covered. I was rather thinking in the direction of the adulteration of food laws, and questions like that. Of course, in any large dealing with the public health law one wants to see those matters dealt with, because they concern the public health very much.

1848. Have you any other suggestion as to the authorities being better informed for the purpose of sanitary administration as to births, deaths, and sickness further than you have already alluded to in the improvement of the registration system?—The medical officers of the local authority of course ought to have access to whatever information is in their district, in public or quasi public institutions, as to sickness; but that would usually be a matter of personal arrangement rather than one requiring absolute law. But it seems to me that it is as much or more with reference to the central government than with reference to the local authorities that this wants consideration. We want an improvement in the system of registration and returns of deaths, and we want a properly established registration of sickness. I am very strongly of opinion that all sickness which is treated at the public expense ought to be made known, and that we ought to know how much of each sort of sickness is so treated. At present we cannot know that, because there are no returns made. I am also very strongly of opinion that institutions purporting to be charitable institutions for relief of sickness or infirmity should be required to give an account of what they do; to keep records and make returns.

1849. What sort of charitable institutions do you allude to?—Any hospital, any asylum, any medical charity.

1850. The returns at present are defective, but do you think that by process of penalty you could make them more perfect?—There are none of a systematic kind that I am aware of. In some of the larger London hospitals of late years they have taken to publish annual reports, but those annual reports are done by each hospital as it likes; there is no concert between the hospitals, and the respective reports cannot well be collated with each other. Other hospitals than the London hospitals very rarely, I think, publish a record of what they do. What I think should be the case is, that all charities should supply a return annually in such form as the health minister, whoever he might be, should direct, of the cases treated and the results of the treatment.

1851. Have you any other remark to make upon the subject of the central authority?—The relation of the central authority to the local authority I suppose should be that of stirring it up when apparently it is in default of action, and in extreme cases to apply for a *mandamus* against it. That seems to be the essence of the action of the central authority in relation to the local.

1852. Did I rightly understand you to say that you did not think that they would want more inspectors for that purpose?—I think that they would want more inspectors.

1853. What sort of staff of inspectors do you think you would want to carry out your plan?—As I have stated I have just had two new general inspectors appointed, and I do not know yet how much ground they will be able to cover; but, as I have stated, our vaccination ground, which is a very detailed inquiry indeed, is covered by four inspectors. For general sanitary purposes, if there were four inspectors a great deal of work would be done, but I do not know that all would be done, probably not. I am speaking only now with reference to the nuisance law—it would be some such number as that. There might be six or eight, no very vast number, who would no doubt see very well to the administration of the amended nuisance law.

1854. I think most of your suggestions have reference to medical subjects; have you considered the possibility of uniting your department to that of the local government?—Yes, I have considered it, and I am satisfied that it would be impossible.

1855. You think that the departments must be kept separate?—I am sure they must be separate. There is no matter about which I have a more decided opinion than that.

1856. Do you never travel over the same ground of inquiry now?—Yes, but only in this way. Here is an epidemic of fever—we inquire into it, and we say this epidemic of fever depends upon the pollution of the water, or depends upon the absence of means for the removal of excrement. We are able to satisfy the local authority of the connexion of cause and effect; we trace it up to that point, and then the local authority is challenged to show how it can get rid of that nuisance. If they are prepared to employ an engineer, a skilled person, to advise them on the matter, there is no occasion for any engineer from the Government to interfere at all.

1857. Who in the first place challenges them to move at all?—The Health Office, who are able to connect the fever with the cause, and to affirm what must be the principle of the remedy. To attain the result there may be many different ways; there may be earth closets, or there may be scavenging, or there may be pipe drains, or other ways which I will not pretend to limit; and the Government I apprehend must be satisfied with the attainment of the end, whether by one of those ways or by any of the others. It is the absence of the nuisance that the Government has a right to claim; it has no right I apprehend to claim that the nuisance should be abated by pipes, or abated by carts, or abated by earth closets; it has simply to claim that the nuisance shall be abated. Supposing that the nuisance is not abated, Government enters on the second stage of the transaction; the Government then is empowered specifically to say, as you have not got rid of your nuisance, you must do such and such things.

1858. When you say the Government, what department do you refer to?—At present, the Home Office. I should address the Home Secretary, saying, This local authority does not abate its nuisance; will you take skilled advice as to the agency to be employed and order accordingly. The business then directly

becomes the work of a different office and a different class of officers.

1859. The object being precisely the same, is there any distinction in the process further than that you investigate the case medically, and that the Local Government Act Office, which is under the Home Office, has the power of compelling action and also has engineering agency? Why should not it be all in one office?—On that point, about the conjoint engineers and doctors, or engineers replacing doctors, I speak with a very vivid recollection of the inconveniences of the old system. When I came into the office, the health inquiries had been I must say very much discredited, and people who were pressing sanitary improvement had been accused of gross exaggeration. Inquiries had been made by persons not accustomed to medical work, and knowledge of those subjects was far less complete then than it is now; inquiries had been made by engineers, and diseases had been spoken of as preventable diseases, diseases that drainage would get rid of, which educated medical men would certainly not have ventured to tell the local authorities that drainage or any such thing would get rid of. The local authorities constructed works at great expense, but presently there would come one of those diseases; and then, in newspapers or in letters to the central authority, they would express themselves loudly and indignantly as to having been led into great expenses under false promises; that they had been led to believe that their mortality would fall 25 per cent., or whatever it was to be, at all events that it would fall very greatly; that they had done all that they were told, but in spite of their doing all that they were told, here they had got small-pox again, or scarlet fever again, or measles again, or whatever it might be; and a very uncomfortable feeling was excited throughout the country by those statements. The real underlying truth of the good which can be obtained through preventive medicine was for years in discredit. I think if that sort of thing is to be guarded against, each department must do its own work; the doctors must do their work, and be responsible for correctness in their department, and the engineers similarly must do their work and be confined to it. It must be remembered too that only a limited portion of my work adjoins the engineering province of the Local Government Act Office.

1860. For instance, speaking of yourself and Mr. Taylor, might you not both follow your own particular line, one the scientific medical line and the other the engineering line, independent of each other, but in the same office, and by that means very much economise the machinery?—I do not see what machinery could be economised, for the two systems are essentially different, But, as I have said, I am entirely of opinion that our two offices, though separate from one another, ought to be under the same minister, and I think it is common sense that we should be so.

1861. Do you not very constantly have to consult each other upon the same subject, and having the same subject of inquiry, ought you not, not only to be under the same minister but under the same roof?—That also, I think, is an advantage, and certainly a pleasure.

1862. Would there not be great economy in correspondence, and in fact a saving of a good deal of official work by your both being in the same building and under the same Office, namely the Home Office?—I think that sometimes there would be. I hope thatI have made myself clear as to this point, that I thoroughly assent to our being under the same minister. I think that that would be a great advantage. I think that there are three departments which ought to be under the same minister. The Local Improvement Office, (for I use a larger word than the Act of Parliament word for that office, because I suppose in the long run it will be the central office for all local improvement purposes) the Local Improvement Office, the Medical Department, and the General Register Office ought to be all under the same minister. Of that I have no doubt at all. But they could be managed separately as departments under different chief officers, just as they are managed now; the chief officer of each department coming into immediate relations with the minister.

1863. Under the head of medical subjects, do you include quarantine?—Of course I include quarantine in theory, but in practice our English quarantine has scarcely more to do with health than any other Custom House affair. Our quarantine system has to do essentially with commercial considerations. We do not have quarantine in any hope or expectation of keeping yellow fever out of the country; we have quarantine because if we did not keep up the show of the quarantine system other countries would quarantine us. I have nothing to do with it myself, at least nothing of importance to do with it. I am occasionally asked questions about it.

1864. Are you not the responsible officer on the subject of quarantine?—That is a very difficult question for me to answer.

1865. But is there any other officer?—There is no other central medical officer.

1866. Have the Board of Trade anything to do with quarantine, except incidentally?—The Board of Trade is, I believe, habitually consulted by the Council Office on all quarantine questions.

1867. But the Orders in Council of course emanate from your office?—From the Council Office; that is to say, from the parent office as officered by the Clerk of the Council, not from the Medical Department of the Council Office. I have pointed out how difficult it is for me answer anything about quarantine, because all that is done in that matter is, I believe, without medical significance; it is done essentially for commercial reasons. There is sometimes active correspondence between the Council Office and Southampton, where there is a medical superintendent of local quarantine, and there is active telegraphing when ships arrive, and so forth; but I believe what is done has reference to the exigencies of commerce, and not to the exigencies of the public health of England.

1868. (*Mr. Whitbread.*) Are we to understand that you do not see that any alteration is necessary in the constituent bodies of guardians who should be in your view at the same time officers for the relief of destitution and officers for improvement purposes?—I do not know that any alteration is desirable.

1869. And you wish a certain number of *ex officio* members still to remain with a certain number of elected guardians?—Yes; the *ex officio* members would certainly be indispensable.

1870. About this central authority which you desire to see established over the area of improvement, do you think that that office should be an office of advice merely or an office of action?—For certain purposes it must be an office of action, that is to say, an office of regulation; but the ultimate compulsion to do the things that are wanted I think must not be with the minister, but with the Court of Queen's Bench.

1871. Is not that rather a roundabout way of getting an improvement made that the minister has to apply for a mandamus, as I understand you, to force any local authority to proceed? You have had some experience of ministers, do you think that practically the Home Secretary would apply for a mandamus to compel any local authority to proceed?—It seems to me that he would be more likely to do that than himself to construct drains. The knowledge of the existence of the power and the establishment of the precedent of a mandamus, would influence all the local authorities in the country very quickly. They would not willingly incur the expense of being proceeded against, and being brought into the Court of Queen's Bench, and they would be more disposed, I think, than in the absence of any such power, to listen to suggestions from the minister. Of course a mandamus would only be applied for in the last resort.

J. Simon, Esq., F.R.S.
31 May 1869.

1872. The Government at the present moment has certain compulsory powers in the matter of drainage and health, in your experience have they been often put in force?—Very seldom, I believe. Mr. Taylor, through whose office the Home Secretary exercises that power in relation to drainage, would of course be able to tell exactly in what cases they have been put in force, but I believe the cases have been very few. But then the law is hitherto very imperfect.

1873. When you say a few, have there been any at all?—I know that in cases which I have myself brought under the notice of the Home Office pressure has been put on the local authorities, and I believe that in various cases the local authority has begun to act under that pressure, without the Government having itself to construct the works. I am not aware that the Government has in any case constructed works. It has made orders, and if any such order is not obeyed, the Home Office can proceed to make the works. I believe that it has not yet in any case actually had to make works, but I am not certain. Mr. Taylor would of course know that better than I.

1874. You think that the health and the local improvement should be under the same local authority, but that they should correspond in two different channels before they reach the Home Secretary, that is to say, your office and Mr. Taylor's office could not be amalgamated?—If my department were subject to the Secretary of State, instead of to the Lords of the Council, the form of every outgoing letter, whether from the medical or from the local improvement department, would always be that it was written by the direction of the Home Secretary, and the replies of the local authority would be addressed to the department which had written.

1875. Precisely so; but the local authority whom you wish to combine for the purposes of health and improvement is to correspond through two different channels, and ultimately with the Home Secretary?—Yes; just as when two different under secretaries sign letters for the same Secretary of State.

1876. Those two secretaries are under the same roof and in daily communication with each other, and can take up any part of each other's work, but as I understand you think that your office could not be so amalgamated with the Local Government Office?—I suppose that in every Secretary of State's office there is a division of work amongst the under secretaries, and here there would be a similar division of work. The public would only see the Secretary of State, but by an arrangement interior to the office the Secretary of State would correspond always up to a certain stage in the transaction through the medical department, and, when it came to actual compulsion, would correspond through another branch of his office.

1877. *Chairman.*] Will you state under what conditions you think that the two offices of Health and Local Government might be amalgamated under the same roof?—We are under the same roof now, but our relations are not so very frequent.

1878. But you are in such relations to each other, are you not, that you can communicate virtually at any moment you wish?—Yes, at any moment. Here would be the difference; at present, if we correspond on the same subject, I write directed by the Lords of the Privy Council, and Mr. Taylor writes directed by the Home Secretary. If the transfer were made either way, we should both write by the direction of the same minister; and of course we should then have, as we now have, free personal communication whenever necessary.

1879. And also the places communicating with you again would communicate with you two through the same Minister?—Yes, quite so. It would all be Home Office business, or all Council Office business, as the case may be.

1880. *Mr. Whitbread.*] It would be a separate branch of the same department?—Yes; separate branches of the same chief ministry. And as regards local arrangements let me add this; I distinctly contemplate that if boards of guardians are to be the health authorities, the Poor Law would require amendment as regards the elections of guardians. Future elections should be not elections of Poor Law guardians, who would then *ex officio* act for health, but should *ab initio* be for a double purpose; namely, to act in the relief of destitution and for the public health. Of course it is understood that I am speaking of country districts which are not special health areas.

1881. You think that under the removal of nuisance law the damming of running water should be specified as a nuisance; do you mean all running water under any circumstances?—I am very well aware that the thing could not be put into law in that unconditional form; it would want a good deal of qualification; but the principle which I would aim at is, that any damming of water which causes inhabited upper land to be water-logged should be a nuisance.

1882. You say that exposing persons contagiously diseased should be a nuisance; have you ever considered to what extent you would carry that?—The words in the Sanitary Act of 1866, at section 38, are "Without proper precaution," I think. Some such words as those, one would use. The words of the section are, "Any person suffering from any "dangerous infectious disorder, who wilfully exposes "himself without proper precaution against spread- "ing the said disorder in any street, public place, or "public conveyance, and any person in charge of one "so suffering, who so exposes the sufferer, and any "owner or driver of a public conveyance who does "not immediately provide for the disinfection of his "conveyance after it has, with the knowledge of "such owner or driver, conveyed any such sufferer, "and any person who without previous disinfection "gives, lends, sells, transmits, or exposes any bed- "ding, clothing, rags, or other things which have "been exposed to infection from such disorders, shall "on conviction of such offence before any justice be "liable to a penalty not exceeding £5." Then the 39th section says, "If any person knowingly lets any "house, room, or part of a house in which any person "suffering from any dangerous infectious disorder has "been, to any other person without having such "house, room, or part of a house, and all articles "therein liable to retain infection, disinfected," he shall be liable to certain penalties.

1883. There are considerable penalties, are there not, for any such action?—Yes.

1884. Do you propose to strengthen the Act in that respect?—Not necessarily so; but I would take the offence as stated here and make that offence one of the several "nuisances" under the Act. In my notion, the amending of the nuisance law in an important particular would be this,—that the local authority, with the approval of the Secretary of State, or the Secretary of State acting for himself, should have power to make regulations with regard to nuisances that are apt to recur or be habitual. Cases of this kind are very difficult to be dealt with in Acts of Parliament; but regulations might, I suppose, be very easily made applicable to them.

1885. Do you think that the country is likely to give the Secretary of State power to make regulations of that sort without the sanction of an Act?—The country has given him that power for protection of money interests in respect of cattle.

1886. With regard to those two clauses, have they been operative or not?—Certainly not much. I have lately heard of some proceedings, but not of much. The Commission cannot but see at what disadvantage all this health-legislation has been in regard of organization and authorities. It has all been in a most desperate state of confusion. Principles are affirmed, and the principles that are now affirmed in our sanitary law are invaluable. Nearly all the great principles that one wants to have affirmed are there, but the neeessary organization and authorities are non-existent.

1887. In the 40th section you will see that the guardians are to be the local authorities for executing

this very Act which you said in your last answer is one to which you attach real importance, although hitherto you have found no means of putting the authority in motion?—The authority is not bound to have any sanitary officers.

1888. The law is sufficient, but you cannot get it at present administered?—That is about the state of the case.

1889. (*Sir Thomas Watson.*) Is not the department of knowledge which relates to public health a branch of medical science quite distinct from that which relates to the cure of diseases?—Yes.

1890. Would you not expect that the solution of the problems which arose out of that department would be more easy to those who have had an ordinary medical education?—Undoubtedly.

1891. And it is with this public health, or as sometimes it is called State medicine, or *hygiène publique* in France, and with this alone, that the Privy Council concerns itself?—Exactly.

1892. Has that science of public health been long recognized or cultivated as a district science in this country?—It has been cultivated under the auspices of Government only very recently. Of course there were important contributions to the knowledge of public health before the year 1848, but it is only since 1848 that the Government has taken much interest in the matter, and the more important investigations have been, I think, of much later date than that.

1893. Is not this branch of medical science hitherto in a rudimentary, or, at least, in an incomplete and imperfect condition?—Certainly.

1894. The proper and sole object of all legislative enactments relating to the public health should be the carrying into effect, in the most direct, effective, and economical manner, the teachings of medical science?—Assuredly.

1895. It is the business of the medical philosopher to furnish the principles of the science of public health; it is the business of the law maker to apply them?—Yes.

1896. Should you not expect, in fact, should you not feel certain, that the intelligent study and supervision of the operation of those sanitary enactments,—those which exist now and those which may be enacted hereafter,—would unquestionably lead to the detection of a still greater number of defects?—Yes, I think that that cannot be doubted.

1897. And to the suggestion of continual improvements in the science of public health?—Yes.

1898. I will ask you whether the supervision and the direction of those sanitary laws could be so efficiently performed by any other kind of person as by an educated medical man?—I am afraid that I am hardly in a position to speak impartially upon that subject, but I can very honestly say that if I did not think so I would be very happy to vacate my present office.

1899. Supposing that an office of so much trust and importance were allotted to a properly qualified man generally throughout the country, should he not be relieved by a suitable remuneration for his services from the necessity of providing for the exigencies of his daily life by the exercise of his ordinary profession, rather should he not be precluded from any distraction from his official duties, and be bound to devote himself entirely to those duties?—You are asking me with reference to local service. There are some very difficult questions of adjustment that arise here before one can answer that question. If the man is to act for a small area he will not have enough to do within that area in public functions to fairly earn a good livelihood from those who employ him. If he has a very large area his services would be worth a handsome salary, which would enable him to dispense with private practice; but then of course his services would be far less local, that is to say, they would be given far less in detail to each place.

1900. In large towns probably such an officer would be sufficiently remunerated for his official duties to render it desirable that he should have no other duties?—Yes, I have no doubt that it would be so in very large towns.

1901. Could it not be so contrived that certain districts within the reach of large towns should be included in those functions of his, so as to remove the difficulty that you spoke of, of employing a local functionary, who has not much to do officially?—Yes, I think that could be done; but however the difficulty remains of the appointment, and unfortunately that is a very great difficulty; the difficulty of patronage, and the difficulty of payment. There is no authority that I am aware of in existence acting over those larger areas, and it would be necessary to create an authority almost for the purpose of creating the officer.

1902. One thing has been forcibly impressed upon my mind since I have been attending this commission, namely, that in carrying into execution the existing sanitary laws one great difficulty has been the dread on the part of the ratepayers and others of the expensiveness of those laws. I would ask you whether you would not confidently expect that the beneficial effect of the official and instructed administration of what I would call state medicine upon the well being of the community would in no very long time much more than repay any expense which might be incurred by such medical supervision and administration?—I suppose that there would be a very great saving in the amount of sickness, if there were a good health administration throughout the country.

1903. Is it not likely that the prospect of obtaining such an office as I have alluded to, in which a man might make a decent reputable income, would produce a succession of skilled men, thoroughly qualified to discharge such professional duties?—It would tend in that direction, especially if at the same time security could be taken that the authorities would always appoint officers who were competent.

1904. There is a body of officers now existing, as we all know, whose business it is to watch over the interest and welfare of lunatics throughout the kingdom, is it not at least as desirable and necessary, while from the numbers concerned it is of immensely larger importance, that similar care and protection should be extended to the poorer classes of the community with respect to health, about which they are really as helpless as lunatics?—I certainly take that view.

1905. You have given some evidence with respect to hospital reports, and you are desirous that there should be information collected from them; the hospital reports that have hitherto been published have not been statistical reports, having any bearing upon the question of public health, but rather they have had relation to the treatment of particular diseases, is not that so?—Where they have in other respects been good their want of uniformity of plan has been an immense drawback from their usefulness.

1906. With regard to some of the difficulties which occur in practice, I should like to have the benefit of your experience. Taking for granted that a very large amount of disease and also a very large number of deaths are annually produced by what you have called excremental poisoning, and that this amount of death and suffering is produced by the pollution of the air and of the water used for drinking with human ordure, are you of opinion that the present laws for preventing this great evil are sufficient for the purpose?—To a great extent certainly they are not.

1907. Would you say that the laws are not sufficient, or is it that the enforcement of them is at fault?—If the enforcement is at fault, still that is a defect in the law, because the law ought to make the enforcement necessary.

1908. There were two or three very remarkable instances, which came before the Privy Council within a no very great number of months, of the prevalence of typhoid fever at Winterton in Lincolnshire, at Guildford in Surrey, and at Terling in Essex. Will you state to the Commission how and by whom, and

how soon, or how late after the commencement of that evil the Privy Council Officers had any cognizance of it?—Winterton had for seven years been almost always suffering more or less from the presence of typhoid fever, and for the last two or three years the disease had been of great local importance, before the facts were known to my department. Of the Terling epidemic we did not hear till it had reached its height. Very many epidemics either never become known to us, or are known only when they are ended. I can tell the Commission that when diphtheria came to England it had been prevailing in an epidemic form in parts of the country for two years before the Government knew anything about it.

1909. Then it appears from that that no reliance could be placed upon the knowledge and aid of medical men practising at certain places for the necessary information or alarm being given to the central authority?—In the present state of the law, none. There was to the best of my belief no public knowledge of the existence of diphtheria in England until it had been an epidemic for two years.

1910. Could you point out any way in which the early detection and extinction of those formidable diseases could be secured?—First, as regards sickness returns, I think that the sickness treated at the public expense ought to be reported quarterly to the Health Office. Secondly, I think that all medical charities ought to keep records to some extent on an uniform plan prescribed by the central authority, and to report summarily their statistics every year. Thirdly, as regards deaths, I think that the quarterly returns of the Registrar-General might be improved, so as to give the same information for the whole country once a quarter as is now given for the three millions of the Metropolis every week; that is to say, that the Registrar-General might give quarterly returns for each of the sub-districts of the country, as he now gives every week for each sub-district of London, stating in a tabular form how many deaths there had been during the previous three months from each of the more important zymotic diseases, typhus, typhoid, scarlet fever, small-pox, &c. I think that that would have a very important influence for good.

1911. You expressed a wish that there should be a registration of disease as well as a registration of deaths throughout the country; the registration of deaths is performed through the medium of medical men throughout the country, who receive no remuneration, I believe, for that duty; is not that so?—That is so.

1912. Would you impose upon them, without any remuneration, the additional duty of reporting the manifold cases of disease?—Certainly not; but I propose only to have the returns of those who are treated at the public expense; and of course great improvement in the health system of the country is not possible except at some additional cost. As to the Poor Law Officers of the country, I think it must be expected from them that they will, and they do in fact at present, make their returns to the boards of guardians; and the boards of guardians ought to be required to have certain broad results of these returns put in a tabular form every three months for the information of the Central Office and of the public. Thus we should hear every quarter with regard to each union of the country how many new cases there had been of this disease and of that of the more important zymotic diseases.

1913. I presume there would be some necessity for inspection arising out of your view of what would be the proper administration of the public health of this country?—Certainly.

1914. In your opinion, ought the inspectors to be, as in the case of the Lunacy Inspectors, itinerant, or stationary?—Itinerant, certainly. Not itinerant necessarily from London, but they would always be moving about in their districts. England might be divided into a certain number of inspecting districts or circuits, and the inspector of each district would be moving about from place to place in it, systematically as far as he could, but liable of course to be drawn off in particular directions if there happened to be any sudden necessity for his presence.

1915. (*Dr. Acland.*) You describe, in one of your valuable reports, five sanitary objects which should be incorporated in a Health Act; that was before the Sanitary Act of 1866, was it not?—Yes.

1916. Are you satisfied with the results of the Sanitary Act in these respects, and do you think that all the objects that in your public capacity you desire are incorporated?—Nearly so.

1917. You specially spoke, did you not, of the absence of special provisions for the regulation of such work-places as are not under the Factory Law?—Yes; the Sanitary Act of 1866 did a grand thing in that respect. I am better pleased with that being in the Statute than with any other one thing that has been done since I have had to do with public health. The provision has hitherto, I dare say, been almost inoperative; but there it is; the principle is nailed, and the thing will be properly worked presently.

1918. The next subject is the want of precision and efficiency relative to over-crowded dwellings?—There again immense progress has been made. Overcrowding as such is declared a nuisance, and the local authority, with the approval of the Home Secretary, is able to regulate the occupation and keeping of tenement houses. There is thus immense progress in principle, but we have been in chaos since then, so that it has not yet borne fruit. After the report of the Commission, we may hope to get an effective working of those things.

1919. The next matter is the absence of provision generally in the country against the construction of houses unfit for habitation; what has been done in that respect?—There the defect remains. There is a great want in the public health legislation. We want the conditions of building regulated.

1920. The next, I think, is the absence of reasonable restriction on the frequenting of public places by persons suffering from dangerous infectious diseases?—Yes.

1921. Then the absence of convenient local jurisdiction over the sanitary state of ships coming into relation with populous places?—That has been dealt with to some extent, but not very skilfully, and it will require, I think, to be dealt with again. The principles are all well affirmed. The ship is made subject to the nuisance law and the nuisance authority, but the thing does not work well.

1922. In truth those points require revision, do they not?—Yes, they do.

1923. In that same report, which is dated the 7th of November 1864, it appears that the medical officers of health of the metropolis sent you in a list of points in which they thought the law was deficient; do you happen to know if they are now satisfied, or if they still make complaints with respect to their powers?—I know that a large proportion of their objects were attained. One of the ablest of them is in the room, Dr. Buchanan, who was also secretary for a long while to the Association of Officers of Health, and he would be able to inform the Commission upon that point.

1924. I ask you that question specially on account of the last clause in that memorandum which had reference to the relation of the officers of health, but here called sanitary officers, to the Poor Law Commissioners. I notice that in that document it seems to be considered that the health officers or sanitary officers should be distinct from the poor law officers. From your experience in this matter, do you consider that a desirable separation?—In special sanitary districts, such as the metropolis and other large towns, you may expect to get a more developed sanitary officer, and a more specially instructed man altogether, than the poor law medical officer can generally be expected to be; but when you come to the country districts, I suppose that almost universally the health officer and the poor law medical officer must be one person. That point was missed before, and it is one of importance. Perhaps I may be allowed to

explain myself. I will start from the point that I took, about causes of death not being medically certified. I think that for all cases that do not fall within coroner's inquests a medical certificate of the cause of death should be legally required. It should be required by law of the medical attendant if there has been a medical attendant, and if there has not been a medical attendant, it should be required of some public functionary. Where there is a special health district I think that the law ought to require that a special health officer should be in action; but in places where there is not a special health officer, functions of that kind or the rudimentary functions of an officer of health should be discharged by the poor law medical officer of the district. I think that in the absence of any special sanitary officer the poor law medical officer should be the sanitary officer. That would apply to country districts where I propose that the destitution authority and the nuisance authority should be one. There the poor law officer in his district should, I think, be the sanitary officer as well as the destitution doctor. But when you come to large cities, where there is a more developed, a more accomplished, and a more special sanitary officer, you ask what is to be the relation of that man to the poor law officers. It must I suppose to a great extent be the relation of voluntary co-operation; but the sanitary officer ought certainly to have access to the books and records of the poor law officers, or else their records ought to be published; they ought to be accessible to him specially, or else they ought to be public documents, so that the whole world should have access to them, as to the quantities and localities of illness. I can speak very particularly about that subject, from my own experience. Before I entered the Government service, I was for seven years acting for a local authority. I was officer of health for the City of London, and when I was appointed the first necessity that came to my mind was, how am I to know what illness there is in the city; and the first official memorandum I wrote was on the necessity of information from the poor law officers as to the diseases under their care. After some difficulties they were kind enough to give me that voluntarily and gratuitously, and for the seven years continued to do so. I am sorry to say that there were difficulties made at first; for very naturally, reasonably, and properly, they expected to be remunerated for the trouble which I asked them to take. Those who held the purse strings would not remunerate them; but there was a great deal of kindliness and generosity on the part of the medical officers, and they threw that consideration overboard, and gave me systematic information every week of the illness prevailing in their districts.

1925. It would appear then that you have in every parish and in every union a medical officer employed by the State for what you call "destitution" purposes?—Yes.

1926. And in all districts excepting great districts or large areas, as they are called, you would propose to superadd to them certain sanitary duties, or, as Sir Thomas Watson called them, duties connected with State medicine, was that your proposition?—The rudimentary duties only. I do not think it would be reasonable to expect any very extensive and elaborate duties from them, nor in the present state of affairs could one, I think, expect that they would have all the requisite attainments for such duties.

1927. Still has not the law of the land occasionally imposed upon the guardians in places where epidemics have raged, or been expected, the administration of those State medicine duties under the Diseases Prevention Act?—Yes.

1928. So that in fact while medical men have been appointed under various Poor Law Acts to discharge the particular duty of the care of the pauper class, they in point of fact have also been called upon to perform important duties in the administration of State medicine, whether they were appointed for the purpose or whether they were qualified for it or no?—The question probably refers to such functions as they have occasionally been called upon to discharge under the Diseases Prevention Act. Its main object has been to extend medical relief at times of severe epidemics beyond the limits of the pauper population, as far upwards in the social scale as emergencies might make necessary.

1929. And they might have to advise for instance upon hospital arrangements and provisions for the sick to any extent, especially in cases of cholera?—There has not in fact been much of such action I think. However, the responsibility has existed, no doubt.

1930. Supposing this large body of men were utilized as sanitary officers, would you have them under the Poor Law Board?—That is a very difficult question to answer, if it means whether medical relief should be separated from the general relief of destitution.

1931. In one of the observations which you made just now, I think that you said that those sanitary duties do fall under the care of the guardians very often, and that in fact they must be combined in the same person. Referring to the proposition of having the health department of the country under one Cabinet Minister or under the Home Office, do you think that all sanitary duties should necessarily be under his supervision? Supposing that the sanitary officer were under the payment of the Poor Law Board as a pauper relief officer, he might be also a public sanitary officer under the Home Office. Would you wish to see the superintendence of these double functions combined under one chief?—I do not think that at present it would be possible to combine them under one chief, that is to say, to make the medical relief of paupers a part of the health administration of the country. That question, however, is an immensely difficult one, and I speak at present with hesitation about it.

1932. That probably bears upon another point about which I will ask you, under the subject of inspection, but how do the local sanitary grievances generally come to your knowledge?—In various ways, and very imperfectly. Sometimes there is a note from a registrar to the Registrar General, which the Registrar General communicates to me. Sometimes the Local Government Act Office gets a report of a fever, or the Home Office gets a report of a fever, and sends it to us. Sometimes the Poor Law Board hears of a fever and tells us; or sometimes a complainant writes to us, it may be mainly about the absence of drainage, and he incidentally mentions fever, or he may write expressly to tell us of an outbreak of fever; it is in very various ways, and sometimes, as I said, we do not hear at all. There are localities that are interested in suppressing the fact that they have got attacks of disease. Sometimes they do not like to be overhauled from the centre with reference to their shortcomings; and at other times they are afraid of having visitors frightened away, and so forth; and registrars are given to understand that they must not communicate awkward facts.

1933. Would efficient inspection or some complete system of inspection obviate a concealment of that kind?—It would do a great deal, but the law of course ought to make the concealment an offence. The communication of such facts should be obligatory.

1934. We have a good many inspectors at this moment appointed by law for different purposes relating to the public health. Sir Thomas Watson mentioned the inspectors for the purpose of lunacy, who are partly medical and partly legal inspectors, are they not?—Yes.

1935. And they inspect hospitals; that is to say, hospitals for the insane?—Yes.

1936. I do not propose to suggest, but still the suggestion arises in one's mind, would they be competent authorities to inspect other hospitals in the country. If they inspect, for instance, a hospital for lunatics outside a town, would they be competent judges of the condition and statistics of the hospitals for other diseases in the town?—They might or

J. Simon, Esq., F.R.S.

31 May 1869.

might not be, it would be a chance in the system; for they would have been chosen for other qualifications.

1937. Then in addition to those lunacy inspectors there are highly skilled poor law inspectors, are there not?—Two of the poor law inspectors are members of the medical profession.

1938. I did not presume to ask of their qualifications to be inspectors, but as a fact there are inspectors examining large areas to which they are respectively assigned, part of whose duty is to report upon all the hospitals and infirmaries belonging to one class of sick in the country?—Yes.

1939. So that you have inspection of hospitals for lunatics and you have an inspection of hospitals for paupers going on at this moment?—Yes.

1940. Then there are inspectors under the Factory Acts?—Yes.

1941. Are they medical inspectors?—I think not. Mr. Baker is in point of fact a medical man, but his appointment bore no particular reference, I think, to his medical attainments.

1942. They are called certifying surgeons, and there are several hundred persons at this moment, are there not, engaged in that kind of medical inspection over all factories?—Yes.

1943. Under another Act are there not medical gentlemen appointed to examine workshops which are not factories under the Workshops Act?—Not, so far as I know, by Government.

1944. The Privy Council send out medical inspectors, do they not?—Yes.

1945. And you have supreme power to send those inspectors from your own office, as I understand, for any medical purpose to any part of the country?—Yes.

1946. Then in fact there are at this moment many inspectors examining the country for different purposes: do you consider from your experience that anything can be done by re-arranging or re-organizing the duties of that kind of inspection: at this moment there is a staff for various purposes, and I am not aware that it has been hitherto considered how far some of their functions might be combined?—That question forms part of the larger one, whether the Lunacy Commission could be merged, or partly merged, in the general health administration of the country, and whether the Factory Inspection could be merged, or partly merged, in the general health administration of the country, and so forth: meaning by "partly merged," merged so far as their subject-matter is medical. Those are questions which I am not quite prepared to answer, but I am not aware that the factory inspectors consider themselves to be acting medically, except in a very qualified sense. The employment of the certifying surgeons has borne reference chiefly to the ages of children; for none under eight years of age were to be employed, and these officers have also to inquire into factory accidents; but there is a wide difference between that kind of work and the work that our medical department did in relation to factories during the four years 1861–3, when we studied all the chief industries of the country in their relation to health, and went into the influence of industries in producing lung diseases. That was a purely medical inspection, which is a very different matter.

1947. Still, under the idea which you have so clearly expressed in the former part of your evidence, that there should be a central office of some kind, it would be a matter for consideration, would it not, first, what kind of duties you would assign to the inspectors, and, secondly, over what areas, large and small, you would appoint them?—If I look at that matter from the point of view of the Home Office, supposing all those matters were in the Home Office, I cannot say that it would not be necessary to have special lunacy inspectors. I should think that on any system lunacy inspecting would be a very convenient unit of inspection; that is to say, that men who inspect for lunacy purposes should not also inspect alkali works or burial grounds. I think it would be a convenient speciality, employing, as at present, a certain small number of men exclusively for that duty.

1948. Have you formed any opinion as to the best kind of organization in the Health Office for all sanitary purposes; are we to understand that you would wish to have them combined, if not in the same persons yet under the same administration, that is to say, in a general health office of some kind?—As a general principle I think that, so far as medical inspections have to be made, they should be made from one office; but special consideration would be wanted for branch offices, with mixed functions.

1949. There is one other point which has not been touched upon to-day, but it is of sufficient importance to ask a question about it; when you have understood that water is probably unfit for use, you have the means, have you not, of analysing it, and reporting upon it?—Yes.

1950. Is there a scientific laboratory connected with the Privy Council Office?—We send the water for analysis always, or nearly always, to King's College, to Professor Miller.

1951. In a district in the country where the water is supposed to be unfit for use, you would not suppose that the local chemist or the local medical man would be necessarily capable of giving a correct opinion as to the condition of that water. Is there any recognised means of testing whether the water is fit for drinking in every district of the country; or would you rely upon the scientific opinion of some one in any parish that might be named?—It would hardly want much of a scientific opinion. The state of the case too generally is that the well is sunk close by the privy and cesspool, and that the soakage is from a very few feet. A chemical analysis perhaps would sometimes be an imperfect addition to the judgment of taste and smell. One could arrive at a conclusion very easily; measuring the distance or tasting the water, it would not want analysis.

1952. As a matter of fact is not great stress laid upon the chemical analysis of water?—Sometimes too much.

1953. The Home Office will undertake, will they not, to analyse water?—In some cases, I believe.

1954. It is the fact that water may be sent up to the Local Government Office, and whether necessarily or no I do not say, but they will furnish an opinion upon that water?—I believe so.

1955. Do you think that laboratories either in the metropolis or elsewhere are necessary for sanitary purposes?—Undoubtedly laboratories are necessary; using the word laboratory of course to include all means of scientific observation, for the adulterations, and diseased and other unwholesome states, of animal and vegetable food, for unwholesome state of water, and so forth; but at the same time we must not disguise from ourselves, as regards water, that in cases where the utmost mischief has been done by water, the real test of the poisonousness of the water has been in the killing of the people, and not in what the chemists have been able to demonstrate.

1956. But at the same time you would say that as an administrative principle it is essential that the Government Health Officers should be able in some way to get reliable analyses of foods and drinks and the like?—Yes, certainly.

1957. And that you would consider as part of the administrative duties of some central health office?—I hesitate to say that it ought to be the duty of the central office to undertake ordinary analyses for localities. No doubt on many occasions they have so done, but supposing the thing to be on a large scale, I am disposed to think that, for instance, Liverpool, Manchester, or Birmingham ought to be able, as part of their municipal government, to look after adulterations and quality of food, the quality of water supply, and so forth; and that they ought not I think to have to come to the Government for it.

1958. They need not come to the central Government, but I understand that you think that some, so to say, recognised or competent laboratories, either private or public, must exist in the country for such a purpose?—Yes, certainly.

1959. And that it is desirable that those delicate scientific operations should be conducted by persons of good known competence?—Yes, of good competence.

1960. Have you anything that you would wish to say to the Commission concerning the extension of the Contagious Diseases Act to the civil population?—I have not prepared myself to speak to the Commission upon that subject, but I have been considering it a good deal lately, and I am not prepared, as at present informed, to recommend it. I think that it would be unwise for the Government to undertake that immense responsibility, unless it saw its way to make a very great difference in the quantity of those sorts of venereal diseases, in which alone society is greatly and permanently interested, I mean *true syphilis*. I think there prevail exaggerated impressions about true syphilis. I have come across statements in print that certainly are likely to convey very exaggerated impressions even of the total quantity of venereal disease which is current. Then the public has translated those statements, which convey a very exaggerated impression of the quantity of venereal disease in the mass, into meaning true syphilis. The belief results that a disease hereditarily transmissible, and spreading among the non-fornicative parts of the population, is prevailing to an immense extent, to an extent very greatly beyond the real facts of the case. I have been looking up the subject, and here is an illustration of the want of sickness returns. We unfortunately have got no returns that we can appeal to on this matter, as extending over long periods of time, and concerning the whole civil population; but last year I had an inquiry made as to the quantity of venereal disease then under treatment among the sick poor in London, and what came out was this. Amongst the sick poor, as far as we could make out, in London, at any one moment, about seven per cent. were venereally diseased; and of that seven per cent., at any moment, about half were under treatment for true syphilis. Impressions had previously been given that the quantity of syphilis under treatment among the sick poor was an amount very greatly beyond this—even up to about ten times as much. Then we looked up the prevalence of congenital syphilis at the children's hospital in Great Ormond Street. I had seen a statement which could hardly have been meant to say so, but looked as if signifying that every fifth child of the sick poor was syphilitically diseased. We looked up about 120,000 cases that had been treated during the last 10 years; and we found that the proportion recorded as syphilitic was only one and a half per cent. These are great differences. So that I think that the public has got exaggerated impressions of the quantity of the disease; but be that as it may, I have a very strong impression of the extreme difficulty of making a great difference in the quantity of syphilis by a sanitary supervision of prostitutes. The promoters of legislation in this matter only present, at present, the very thin end of the wedge. They talk of permissive legislation, and the mildest form of permissive legislation, but they show us what is wanted if the thing is to be effectual. We are told that every third prostitute is diseased, and I have very little doubt that it is so. I think it is suggested that in London there are something like 18,000 women who get their living by prostitution. This would mean that we should want 6,000 beds in London alone to work such a system as is talked about; but say that accommodation is only required for 3,000 or 2,000 beds, it is a very formidable requirement, especially when you consider what people are saying now about the poor law asylums for the sick. Then there would be a great organization necessary, and an amount of supervision of prostitutes required, that would be very difficult. And what would be the result? I have not the least doubt that you would make a great difference in the prevalence of gonorrhœa, and in the prevalence of pseudo-syphilis; but the State has not, I apprehend, to trouble itself much about preventing these forms of disease. I do not suppose that the Government needs take very much to heart that a considerable quantity of clap is current in society, or that a considerable quantity of pseudo-syphilis is current. Hereditarily transmissible true syphilis is the only very important question; but to prevent true syphilis to any great extent is incomparably more difficult than to prevent the other forms of disease. It eludes discovery to a very considerable extent, it is very little complained of, and it is very recurrent, in the women who are the subjects of it; and thus I fear that any result to be got by law in relation to venereal diseases would be got least of all in the only part of the catalogue of such diseases in which society is permanently interested. In short I do not see my way at present to recommend any extension to the civil population of such measures as have recently been in force at certain military and naval stations. Of course the case as regards military and naval prostitutes is quite a special case; special as a matter of finance, and special in another point of view; special, because the country loses so very much in the effectiveness of the army and navy by venereal diseases, that it is worth while to pay, and even to pay a very long sum, to diminish their chances of catching even the unimportant venereal diseases; and special also in so far as that the State which keeps large masses of men unmarried has a sort of responsibility for the moral and physical consequences which are involved in that state of things. So those are special cases. But when you come to the civil population I think the case is different. As far as I can see my way, I do not think that the good to be attained is by any means large enough and sure enough to justify the Government in departing from the principle that it recognizes in analogous other cases, the principle of *caveat emptor*.

1961. Do you think, in consequence of the discussions which have taken place of late, that it is or is not desirable to have special education or special examinations for a class of sanitary officers, or would you leave that to chance?—I think it is in the highest degree desirable. The subject of course is difficult. Originally the Board of Health had to approve of the appointment and to approve of the removal of the officers of health, but that control was given up in 1858, and I suppose it was given up because it was found to be really inoperative. But I think the Government might very usefully be empowered to lay down regulations as to the qualifications for sanitary offices; and, indeed, I would extend that principle to the poor law appointments also.

The witness withdrew.

Adjourned to Thursday next, at 12 o'clock.

Thursday, 3rd June 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.
The EARL of DUCIE.
The Right Hon. LORD ROBERT MONTAGU, M.P.
The Right Hon. STEPHEN CAVE, M.P.
Sir THOMAS WATSON, Bart., M.D., F.R.S.
Lieut.-Colonel EWART, R.E.
SAMUEL WHITBREAD, Esq., M.P.
JOHN TOMLINSON HIBBERT, Esq., M.P.
EVAN MATTHEW RICHARDS, Esq., M.P.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
JAMES PAGET, Esq., F.R.S.
FRANCIS THOMAS BIRCHAM, Esq.

imon, Esq., F.R.S.

June 1869.

(11.) JOHN SIMON, Esq., F.R.S., further examined.

1962. (*Mr. Bircham.*) You expressed at our last meeting a strong opinion as to the chaotic state of the law. Your illustrations were principally, I think, with reference to the law in its application to rural districts; may we infer that in your opinion the Local Government Acts provide generally for health matters in those districts where they are applied?—I think they do fairly.

1963. Subject to amendment in detail?—Yes.

1964. You would break up that part of the country which has not taken upon itself the Local Government Act, or is not under any special legislation, into areas something in extent, as I understand you, similar to the poor law unions?—I would accept those divisions as existing.

1965. You would accept the poor law division as the health division?—Yes.

1966. Does it occur to you that physical questions, such as water and drainage, ought to enter considerably into the formation of districts for health purposes?—It does, and very strongly; but the requirement which you suggest could only be directly fulfilled by mapping out the country *de novo* on the basis of drainage affinities, and making this the leading principle in the constitution of local authorities. And it seems to me that the object would be better attained in this other way, namely, that taking, to start, the poor law division of the country, each health authority should be amply enabled to act by committees; and this, either for divisions of district, or for divisions of subject matter; and that either totally or by its committees it should be able to co-operate with adjoining health authorities; and more than that, I would propose that the central authority should be able to require such combinations to be made. That is how I would meet the large drainage question, which no doubt is one which ought to be met.

1967. The country has been largely divided for the purpose of highways. Does it occur to you that it is desirable, in analogy to what obtains in the Local Government Acts, that the highway boards and those who have jurisdiction over sewers and drains should be the same?—Yes, it does occur to me as an advantage; but there are advantages also on the other side, counterbalancing advantages, as I think. It is very important that the local health administration of the country should be identified with the system of medical relief of the poor. There is a medical staff existing everywhere throughout the country for the purpose of that system, and therewith are ample facilities for knowing what is the state of health of every poor law section of the population; and it would be inconvenient, I think, to totally dissociate that machinery from the local health administration of the country.

1968. Do that and other considerations induce you to think that without more inquiry the poor law union districts might be and should be accepted as the health districts?—I think it on the whole better; observing also, that, as far as I understand the highway board system, it would be no better adjusted than the poor law union system to drainage exigencies and so forth.

1969. Would it not be better that the country should be mapped afresh for purposes of health (including sewers, &c.) and highways, there being no particular necessity that the highway districts should remain as at present?—I have no doubt it would be by far best, if attainable, that the country should be reviewed altogether, and intelligently re-mapped for all modern purposes of local government; but this would be a work of immense duration.

1970. The poor law districts have been formed solely with reference to poor law administration,—water supply, or drainage, or any consideration of that sort having been quite out of the question?—Yes.

1971. Assuming districts formed, if I understand you aright you would leave the local board without any authority intermediate between it and the central London board?—I do propose, as I will hereafter explain, that, for certain special health objects, there should be a second set of local authorities—authorities of larger areas; but between these authorities and the nuisance authorities there would be no community of business. I do not propose that there should be an authority intermediate between the nuisance authority and the central government in respect of nuisance action.

1972. You would place the nuisance action and the health action, if I understand you aright, in the same hand?—Yes, a certain health action. There are some sorts of health action for which I should not propose to vest authority in common local boards. There are certain health actions that have to be discharged over large areas, and perhaps in a somewhat different spirit to that on which we can always reckon in elective local boards, and those I think would be better exercised, as the lunacy action is now exercised, by the magistrates of the country.

1973. Nothing is to go between the central authority and the local board for bringing what the local board is doing under the notice of the central authority?—I think that it would be inexpedient; it would intercept communication rather than promote communication, and diminish the force of stimulation rather than give it effect.

1974. Have you had much experience of the manner in which health questions are treated in rural districts?—Yes, indeed I have.

1975. Assuming unions of rural parishes of a purely agricultural character for health purposes, do you think they would act without pressure from outside?—No, I am sure they would not; but hitherto, as of course the Commission knows very well, what we have been able to do in my department, in the way of pressing local authorities for common health administration, has not been very much. Public vaccination is the only matter of health administration where we have had ample power, and there we have had an organization through which we have been in constant communication with boards of guardians, giving them skilled advice, and I must say that it has worked very well. Of course the agricultural mind, as represented in country boards of guardians, is not always that quality of mind which is likely to be very well up in such subjects as vaccination. We have had to bring a good many new thoughts before them; we have had to change their system very much indeed, and to interfere in details; but they have accepted that interference and have altered their modes of action; and now, within the last two or three years,

the improvements which have been made in the system of the vaccination of the country are enormous, by the action of those boards accepting the suggestions given them for their mode of action.

1976. Is that a matter which has caused any increase of rating?—Yes.

1977. Any large expense?—Not such expense as would be caused by new sewers.

1978. Then you would interpose nothing between the Health Minister and his staff in London and the local authority created, whatever it might happen to be?—Nothing.

1979. How would you gain a knowledge of what is going on in the country?—The Commission will remember that I laid a good deal of stress on an improved system of records and returns of the deaths and the sickness of the community.

1980. You said something of a staff of itinerant "state-medicine" inspectors; do you propose to assign to them any duty of communication between the local boards and the central authority?—Yes, certainly; such as is now the duty of our vaccination inspectors for vaccination purposes. They inspect every vaccination district in detail once in two years.

1981. What kind of qualification do you propose that those itinerant inspectors should have?—Quite recently two such inspectors have been appointed by government, and their qualifications are these: One of them, Dr. Buchanan, has for many years been acting for us as occasional inspector, and has written reports which are of very high reputation. He had been for years physician of the Fever Hospital. He had also long been one of the metropolitan officers of health. Thus in various ways important for our purpose he had the qualifications of great experience and special study, not qualifications that one could very easily define on a schedule of professional titles, but qualifications that made him exactly the kind of inspector that was wanted. The other is Mr. Ratcliffe, who had similarly done a good deal of occasional work for the office, and had written a number of valuable reports, and had been generally occupied in the study of epidemics for many years.

1982. My question was rather more general, not as to the qualification of individuals now filling particular offices, but what you might propose as the qualifications of those itinerant inspectors—for instance—should they be medical men?—Yes, certainly.

1983. I understood that you stated in answer to a question which was put to you in your former examination that some officers possessing "state medicine" qualification and education would be set going as itinerant inspectors?—Yes.

1984. I understood you to say that you would rely on the Court of Queen's Bench to put in motion the local boards, by means of mandamus or otherwise, in case of neglect of duty?—I of course cannot venture to speak very confidently on points of legal practice. I speak subject to the correction of men who know much more of these matters than I can pretend to know myself, but it seemed to me that to rely on the ordinary apparatus of mandamus was the best course.

1985. Do you see any reason to withdraw from the Health Minister the power to make the order in the first instance, instead of going to a court of law to make it?—I am rather disposed to think that it should not be the Secretary of State's order, but the order of the Court of Queen's Bench.

1986. You would suggest that the Secretary of State should appear before the court as a relator of certain mischiefs going on, and suggest to the court some remedial action?—Yes, that is just it.

1987. Until 1866, when the 49th section of the Health Act gave the Secretary of State the power to execute works in default of the local authority, there was no such power?—That is so.

1988. Do you know what the history of that addition to the health power was?—Yes, I know something about it, for I myself very strongly advocated that the form of the law in relation to local authorities acting for health purposes, in certain cases, should be "shall" instead of "may." That view was particularly argued in my seventh and eighth annual reports. It was accepted by my masters, and the proposal was, in consequence, made to Parliament. In the original form of the 49th clause it was not proposed that the Secretary of State should exercise such a power as was eventually given to him, but strong representations were made from some towns that they would generally prefer this form of legislation, and that if pressure was to be put upon them they would rather that it should be put by the Secretary of State. So, late in the session of 1866, after the change of ministry which then occurred, the clause was altered to its present form; I do not know exactly what the steps were.

1989. You think it unsound legislation?—The intention is of course entirely at one with my recommendation, but the exact form is not such as I think best. I thought it inexpedient, and I still think it inexpedient.

1990. Would not the knowledge that such a power existed frequently prevent the necessity of its exercise?—Yes, but, still more, I feel that with respect to the mandamus power.

1991. If in a few instances the Secretary of State interfered, and the consequence was a larger expense to the particular district than would have been incurred if they had attended to their own business; do you think that a few examples of that kind would have a salutary influence upon other boards who were inclined to neglect their duty?—Certainly.

1992. You have had experience, I daresay, of health being affected by the habitation of tenements unfit for human habitation?—Yes, unfortunately to a great extent.

1993. Has any remedial legislation on that subject occurred to you as desirable, such for instance as requiring new tenements to be licensed by some authority before they could be inhabited?—Yes, I am of opinion that such ought to be the state of the law.

1994. And that there should be legislation enabling the local authority to enforce in all tenements a proper supply of water, and proper privies, cess pits, and so on, before the house should be inhabited?—Yes.

1995. Are you also of opinion that with regard to existing tenements there should be sharper legislation than there now is, with a view of bringing about changes where proper conveniences do not exist?—Yes.

1996. You said something, if I understood you aright, as to the irresponsibility of water companies. Did you use that phrase with reference to a general failing of duty on the part of water companies?—I think it is only now that water companies are beginning to understand what an immense influence for good or bad is in their hands; I should therefore hesitate very much to speak as imputing criminal negligence to some of the things which water companies in past times have done; but, not to mention the excremental stuff that some companies have distributed at times when they were ignorant of what might come from such distribution, I think that at least henceforth they ought to be made subject to control.

1997. What legislation would you propose in the matter?—In the first place, I think that water companies should be subject to certain general rules, such as the London companies are, in a very mild form, subject to, as to the filtration of the water, and so forth. No new water company should be establishable without being required to show that it had satisfactory means of supplying pure water. Some sort of preliminary certificate should be necessary, such as the Board of Trade now gives in the case of new lines of railway. And here one must also look a stage further back. First of all, the sources ought to be protected from pollution; and then the water companies should be required by law to take proper precautions for keeping their water clean; and failing that proper care, they should be punishable at law, punishable by indictment. Further it seems to me that the way ought

to be made as clear as possible at law for persons injured by the water companies obtaining damages from them. In my last two official reports I have endeavoured to show how much some such remedies as these are wanted.

1998. In the suggestion that the sources should be protected from pollution, of course all the water companies would be well pleased by legislation upon the subject; that is a matter a good deal beyond their control, is it not?—Yes.

1999. Have there occurred to you any special matters that you could suggest as corrective of any general neglect of duty on the part of the water companies? I would draw your attention to the jurisdiction which exists with local boards under the 75th section of the Act of 1848 and the 51st section of the Local Government Act; I mean those sections which give the local board power to lay on water when it can be procured at certain prices; are those clauses much availed of, in your experience, by local boards?—I cannot offhand accurately state to what extent local boards have acted under these sections.

2000. (*Mr. Shaw.*) As to mandamus being a really efficient remedy. Suppose, for instance, that the Act said that the local authority shall see that every house is drained by a sufficient drain, you could not have a much more peremptory clause than that?—No.

2001. Then if you had a mandamus upon that, the local board might already have done something, but something which to your eye and to the eye of the Secretary of State might be insufficient, and do you not think that there would be great difficulty in the Court of Queen's Bench judging upon the mandamus of what was or was not sufficient, seeing that the probability is that they would not try it upon affidavit, but would have a jury trial at a great deal of expense and complication? would not it be very much simpler that the Secretary of State should have the power of saying that such and such drain is sufficient or insufficient, and you must make it better, and if you do not you shall be liable to a penalty for contravening my order?—No doubt that does look much easier to work than the pure mandamus arrangement; but I presume the law could conveniently combine the two modes of procedure, so that details to be embodied in a mandamus should have been advised by a public officer, and the mandamus should require the works to be done to this officer's satisfaction.

2002. The rule as to a mandamus is that the court will never grant a mandamus against any party who has a discretion if he has once exercised that discretion honestly, however mistaken it may have been; would not that be a great bar to the practical remedy by mandamus?—Perhaps hardly so. If the law were well constructed the local authority might be allowed large discretion as to means and modes of action so long as the result should be attained.

2003. There would be no difficulty, would there, in the Secretary of State making the order, and the Act inflicting a penalty upon any party who disobeyed that order?—I presume not.

2004. That would not involve the Secretary of State doing the work himself; he would send the order to the parties to do it, and if the parties contravened it, or did it ineffectually, they would be liable to a penalty to be recovered in a simple form?—Yes.

2005. Would not that be equally in *terrorem* as the remedy by mandamus, besides being much prompter?—Yes, for a large class of cases I think it would.

2006. You mentioned in your evidence that the guardians as the local authority ought to have very ample power of acting by committees. I presume you meant by that the sort of power which exists under the Nuisances Removal Act of 1855, under which the local authority may appoint a committee of their own body, issue notices, and take proceedings, and in all those, or in any other specified respects execute this Act, with power to delegate their authority?—Yes. There is similar provision in the Act of 1860, and a very good clause in the Sewage Utilization Act of last session, with respect to the powers of a committee.

2007. You merely meant generally the power to delegate their authority to committees?—Yes.

2008. Will you tell us why you attach so much importance to that?—Because of the very large extent of the unions. If the area of the union is to be the area of the nuisance authority it may be an area extending over a great many miles in all directions.

2009. Then would you have them appoint several committees?—Yes, but there would still remain the one original, tangible governing body for the Government to address.

2010. Do you think that the power to guardians to appoint committees would have any operation in inducing persons having special aptitudes for health questions to serve upon the board of guardians, in order to be put upon such committees, whose duty would be principally sanitary?—I think it might.

2011. Is there not great difficulty in getting a sufficiently high class of men to serve on those local boards?—I believe that that is one very great difficulty, and another very great difficulty unfortunately is that people of an opposite sort are sometimes very anxious to serve.

2012. Is that for the sake of a job?—Owners of house property procure themselves to be elected on boards for the protection of their personal interests.

2013. Would you not regard the interposition of a county board as a means of getting a higher class of persons interested in the subject, and, so to speak, educating a higher class of men into sanitary knowledge?—That would of course be good; but then, as a set-off, you would have so much less intimate knowledge of particular places that I fear the administration of the law might fare badly.

2014. Do you not think that they might form an intermediate court of appeal, so that if a person complained that the local board was not doing its duty the county board might step in?—I confess that I think not. I think it would be inconvenient.

2015. You were mentioning that you thought that the nuisance law was tolerably complete as it stood, and that there were not many excepted cases; there is no power, is there, to close a source of water supply which is found to be injurious to health?—No, and I have often very much wished for that power, but one cannot shut one's eyes to the fact that there are difficulties in the way. A man has a well in his garden close by his cesspool, and it is polluted, and must be polluted as long as the contiguity exists; but when you propose to shut it, he says, "It is very hard to shut "up this well. I never drink it, and my people never "drink it; we only use it for watering the garden, "and purposes of that sort." That may be true or untrue, but if it is untrue you do not easily prove that it is untrue.

2016. But there is no power, is there, to close even a public well to which notoriously persons have access for drinking purposes?—I think there is. That is to say, the property in public wells is vested in local authorities.

2017. Has it the authority to close such a well?—I suppose no one can effectually dispute the right.

2018. The question was put to a witness the other day, and he was under the impression that there was no such power?—I have never witnessed any difficulty on that score; I have known plenty of cases of public wells being closed.

2019. Considering the condition of cottages in the country, and considering the class of persons who inhabit them, who are generally of a low class, and have no real remedy against their landlords for want of repair, do you think it would be advisable to bring such cases under the law; for instance, where the roofs were not water-tight, do you think it advisable to give a summary remedy for those cases?—Yes, I do think that very desirable, but I am disposed to think that the condition of cottage property, apart from questions of nuisance, might be less well dealt

with by the ordinary nuisance authority than by magistrates in quarter sessions.

2020. That power does not exist exactly at present, does it?—No.

2021. Have you found any instance in which the provision, which for the first time was introduced into the Act of 1866, of the local board being obliged to give notice before taking proceedings and summoning a party for a nuisance, has operated badly?—That has certainly been represented to me as a blot in the law, and as interfering with the promptitude of proceedings, and I therefore think it to be regretted.

2022. Have you directed your attention at all to the question whether sanitary reform should be made by byelaws or by clauses in Acts of Parliament, and whether there are not a number of minor things which require to be treated by byelaws made by some authority?—Yes. The notion which I have of a nuisance law is this: that a law made with the view to summary proceedings, but of course subject in certain cases to appeal to a superior court, should be made to cover as far as practicable all influences that endanger public health, and with the word "nuisance" used to cover as large a number of such influences as possible; and then that in respect of all "nuisances" liable to be recurrent or to be habitual, either the central authority, or with the consent of the central authority the local authorities, should be able to make regulations or byelaws enforceable by penalties. That is my notion of the plan of the law.

2023. You mentioned, I think, in your evidence that overcrowding is declared a nuisance, and that the Home Secretary is able to regulate the division of tenement houses; is it not the case that he has no power of that sort until the local authority applies to him?—Yes, that is so.

2024. Then the local authority may render that power perfectly inefficient by refusing to make that application?—Yes.

2025. Would you conceive it to be advisable that the Home Secretary should have that power without requiring any application on the part of the local authority?—Yes.

2026. That it should be a compulsory part of the Act, instead of a part which the parties might or might not put into operation?—Yes, compulsory for cases requiring it, and enabling the Secretary of State of his own motion to judge whether a case had arisen.

2027. There is a clause in the Amendment Act of 1868 (clause 10) which says this, "the sewer authority, or in the metropolis the nuisance authority, shall have the like power to make provision for the temporary supply of medicine and medical assistance for the poorer inhabitants, as it now has to provide hospitals or temporary places for the reception of the sick under the 37th section of the Sanitary Act, 1866; but such power to make provision for the temporary supply of medicine and medical assistance shall not be exercised without the sanction of Her Majesty's Privy Council." That is rather a new kind of clause, is it not, because without proclaiming the district, as is done under the Act of 1858, the Privy Council obtain under this clause the power of sanctioning extra expenditure?—Yes, I knew nothing of that clause until I saw it in the Act. I do not know where it came from, nor anything whatever of the history of it.

2028. Would you consider it advisable that that sort of power should be increased, that some central authority, either the Privy Council or the Home Secretary, should have power to sanction additional measures being taken by a local board without going to the alarming process of proclaiming the district in the Gazette?—Yes, certainly; I think altogether that the machinery of the Diseases Prevention Act might very advantageously be reviewed in that sense.

2029. And that the central authority should have power to give increased authority to a local board in special cases in a quiet way?—Yes, at various times such increased authority has been asked for, but it could not be given without such a fuss that it was on the whole not desirable that it should be given.

2030. That clause does provide for its being done in a quiet way?—Yes.

2031. (*Mr. Powell.*) You suggested, in answer to Sir Thomas Watson, that the inspectors of the Government should be itinerant. Do you mean that they should go over the country making examinations day by day, moving at their own discretion; or that they should go from place to place when sent for under some circumstance or other?—They would of course be acting under central directions, and those central directions would be given according to the requirements of the districts. An estimate of the requirements of the districts would be formed in one of two ways—special representations made to the central authority, or the death returns and sickness returns of the quarter. The central authority might receive no representation from the local authority, who might be fast asleep as to its duties, but the mortality returns or sickness returns of the quarter might show that there was an epidemic of preventable disease going on in the district, and then the inspector would be directed to go there.

2032. He would go when moved by the authority in the district, or under the direction of the central authority, when there seemed to be something remarkable in the circumstances of the district, or when the authorities of the district asked for his attention?—Quite so.

2033. And you would likewise enable the central authority to listen to private complaints, and to send an inspector in case private complaints were made?—Yes, certainly. All that is our present practice; it is very imperfect at present, because the system of returns is so imperfect; but that is our system.

2034. And would the inspector, whom you have described as itinerant, under the circumstances which you likewise described, be a medical gentleman?—Yes.

2035. Supposing that circumstances were to occur leading the Government to think that some engineer officer, or some one acquainted with engineering, ought to visit a district, he would come subsequently and independently?—Yes.

2036. There would therefore be a second visit?—Yes, in such cases there would be a second visit.

2037. Could you define in any manner when the inspector so sent should consider that he ought to take any steps; for example, if he saw in a district that there was a cesspool or two, or some trifling things of that kind, he would probably not think it necessary to do anything himself?—He would advise the local authority.

2038. Then you would place him in those itinerations in communication with the local authority?—Yes.

2039. But you would not give him any power to act?—Certainly not, in the first instance. In the first instance it would be mere inquiry and advice; that is the principle on which we act now.

2040. Should you think it expedient that a medical officer so acting should have some little knowledge of the materials of construction, so as to be able to give sound advice; to give an illustration—a naval officer might fairly be expected to pass an examination in steam, but you would not suppose him to construct a steam engine?—I suppose that every well-educated officer of health has such general knowledge of construction as you speak of.

2041. Would you expect that officer to devote himself to that subject, and to arm himself with knowledge, so as to be competent to advise?—Certainly, to a limited extent. You of course will understand that I should not expect him at all to take the place of an adviser on building.

2042. But you would expect him to be acquainted with the ordinary appliances to improve drains, and so forth?—Yes, but never to pretend to speak as a skilled person on the subject-matter of any profession but his own.

J. Simon, Esq., F.R.S.

3 June 1869.

2043. Would you still retain and reserve some power for special occasions analogous to, but not necessarily the same as, the Diseases Prevention Act, or would you suspend that question of legislation altogether?—Looking at it from a purely medical point of view, I do not see much use in the separateness and occasionality of the Diseases Prevention Act. That Act makes a very abrupt line of demarcation, in which I do not see any advantage, between ordinary and what are called extraordinary occasions. I think that abrupt line of demarcation is inconvenient. But, speaking from a different point of view, I believe it is necessary that the local authority should be strictly limited as to the classes to whom it shall give medical relief without pauperising the recipient. Under the Diseases Prevention Act the authority, if it chooses, can give medical relief not only to the pauper class, but any height up in the scale, at its discretion; and I am told by those who know this part of the subject better than I do that it would be inconvenient to alter that state of the law. I believe it to be the view taken by the Poor Law Board that that line of demarcation is desirable, and that the power of giving medical relief above the pauper class should only be for extraordinary occasions definable by Government under that Act.

2044. Do you think that the powers given to all the authorities should be so widely extended as to render unnecessary any special legislation of the character which is to be found in the Diseases Prevention Act; in other words, should no power be kept in reserve by the central authority to be exercised on a special occasion?—I think that simplification would be desirable to this extent, that putting a special Act in force by Order in Council should not be necessary; that the ability to confer special powers on local authorities for somewhat extraordinary purposes should be exerciseable by the central authority as a transaction of everyday life, if necessary; that the minister should be able to do it by letter, without gazette, and without any formal order. But it seems convenient that the discretion should be with him, and not with the local authority, as to when that extension of powers should be made.

2045. Then, in other words, there should be certain powers conferable on the local authority by the central authority which the local authority is not possessed of, except when specially authorized in some much simpler sense?—Yes.

2046. Pursuing that line of examination, could you state in a few words what those special powers should be?—The power to extend medical relief in its largest sense to persons not paupers.

2047. There is a provision in the Diseases Prevention Act with respect to speedy interment of the dead which touches persons' susceptibilities very much, would you have a power of that kind?—Not as an extraordinary power. I am not aware that it is more wanted in relation to cholera, for instance, than in relation to small-pox or scarlet fever.

2048. Do you think that each community ought to be authorized to have a disinfecting apparatus to disinfect clothing, or bedding, or the like?—Yes, I think every health authority ought to be required to have such apparatus.

2049. And do you think that there ought to be a power to compel people to resort to this apparatus?—Perhaps not quite in that form, but in substance I should say yes.

2050. Could you explain your views on that subject for the guidance of the Commission in suggesting an amendment of the law in that case?—I have no doubt that contagious diseases are very much spread by slovenliness in the way in which things soiled by the discharges of the sick are dealt with; and such slovenliness is now punishable; it is treated as a nuisance for anyone to deal in a slovenly manner with such things—to send them about without precautions, and so forth. That in my opinion ought to be strictly worked, and it cannot be strictly worked unless the authority has properly established arrangements for disinfecting; but if the authority has such arrangements it can then, I think, enforce the provision strictly.

2051. And the authority would probably have special carriages to convey those articles, so as not to spread infection by the very fact of their being conveyed through the streets?—Yes, under a good system of local administration the disinfection by the local authority would form a very important part of the local proceedings. And in respect of the poorer classes of the population, proper officers would be in communication with houses where infectious disease prevailed, and would give disinfectants for the disinfection of discharges (as, for instance, in the case of typhoid fever), and for other purposes, and would collect soiled things and have them disinfected, and would advise generally on precautions against the spread of disease.

2052. You stated in answer to a member of the Commission on a former occasion, that there was still some defect in the law as to the construction of houses unfit for habitation, and you stated to-day that you thought no house should be occupied except after a licence by the local authority—is that the only defect in the law which you are aware of as regards buildings?—It seems to me that the fitness of original construction might be sufficiently provided for under a system of first licences.

2053. But you would not give the local authorities a capricious power, would you, of refusing a licence, provided that their byelaws were complied with?—No, certainly not.

2054. Is it your view that in every rural district the plans should be submitted to the local authority and be approved of by them?—Yes.

2055. There is one point of great importance, and that is the ventilation of sewers; without travelling over the whole of that difficult ground, would you express your opinion as to the ventilation of sewers by rain pipes. I observe in the model byelaws and in other byelaws which have been applied to different localities, there is this byelaw, "Proper ventilation "shall be provided in the drainage of every house by "means of the rain waterpipe by special pipe or shaft, "or such other method as the local surveyor may "direct," do you think that that is a satisfactory state of the law?—That is a very good rule I think.

2056. Then do you approve of ventilating the sewers by means of rain pipes?—Yes.

2057. You think that satisfactory?—Not as the whole of the ventilation, but as part of the ventilation. They may want a good deal more than that.

2058. Do you think that there is no danger of conveying disease to a house from some defective construction or some decay of the rain pipe?—That ought to be guarded against.

2059. Supposing that a mandamus was issued against the local authority, have you considered how the person armed with the mandamus would exercise it, what would he do with the mandamus after he had got it; you remember that the Home Office has the power to construct works itself, but what is the Court of Queen's Bench to do beyond issuing the formal instrument?—I suppose it would be requisite that the Court of Queen's Bench should have power to authorize a public officer in default of the local authority to proceed instead of the local authority in the particular case.

2060. Is the Court of Queen's Bench to keep watching and observing and seeing that all those things are done?—I suppose that the appointed public officer would do that, and in case of need would apply a second time to the court.

2061. Then you come back to this, that you interpose the Court of Queen's Bench, and all that complication of the process of applying and gaining a mandamus, between the local authority and the Home Office?—I think there would be more security for the thing being firmly worked if it were worked by the ordinary judicial tribunals of the country, and according

to their ordinary forms of procedure, than if it were worked by a government department.

2062. Is not the Home Office sufficiently difficult to move without another buffer, as you term it?—But the Home Secretary in relation to local authorities may sometimes have a timidity in moving that the Court of Queen's Bench would not feel.

2063. You would still retain, would you not, the authority with the magistrates to make orders, and so forth?—Yes, I do not propose to alter that.

2064. Some question was asked you about the special regulations as to lodging houses, and so on, and you expressed an opinion that the central authority ought to have the power of initiating regulations. You bear in mind that the local authority have power to make byelaws or not to make byelaws, as they see fit. Would you give the central authority power to make byelaws, supposing the local authority remained inactive as to the making of byelaws?—Yes.

2065. Do you propose to place the Lunacy Commissioners immediately under the central authority which you have contemplated?—I have not thought out the position that the Lunacy Commissioners should have in the health system of this country, because I have looked upon them as practically a separate department.

2066. I presume that in the construction of the law, and in carrying out the law respecting dwellings, you would always bear carefully in mind that you may make buildings so expensive and unremunerative that no capital would flow into such enterprises, and that you would defeat your end by the means that you employ?—If a certain style of house, a house not wholesomely habitable, were shut out of the market, other and proper houses would be built to supply the want of houses. If only decent houses were marketable commodities, they certainly would be supplied to meet the demand.

2067. Then you would bound your law by the limits imposed by the most rigid conditions of health?—Not by extreme conditions, but by reasonable conditions. I would not let human beings be living, as considerable sections of the community have been shown to live, in conditions not desirable for swine.

2068. Still you think that the consideration which I have just suggested ought to be borne in mind?—It must certainly be borne in mind, but I do not think it would be found a great practical difficulty.

2069. (*Mr. Cave.*) I presume one reason why houses are unhealthy is, that there is nothing below the floor in the way of excavation, the floor being on the ground?—Yes, in many cases it is more or less so.

2070. But yet I suppose there is not a cottage in the country in which there is any excavation between the ground and the floor?—Cellars are very exceptional.

2071. But you would not shut out such cottages from habitation, would you, on that account?—Not unconditionally, but I would, as far as practicable, require that the soil under the cottage should be dry, and that the cottage should be efficiently floored.

2072. When you say that if bad cottages were excluded from habitation good ones would be built to supply the demand, must not you qualify that by considerations of the expense of building a good cottage and the rent which the tenant can afford to pay?—I think that the amount of pay would adjust itself to the state of the law. A man must live in a habitation, and his wages would in the long run adapt themselves to that rent below which habitation could not be got.

2073. Do not you find practically that in spite of all the exertions of landlords to make people live in a proper way in cottages, the question of rent is so urgent with them that they elude almost every regulation and overcrowd their cottages, and in other ways defeat the object of the landlords?—Yes; the difficulties are undoubtedly very great, and I do not ignore them.

2074. You would say, would you not, that the difficulty of providing habitable cottages for the labourers in poorly paid districts is one that you could hardly see your way to get over at present?—It touches on such very difficult question of political economy, on which I really do not feel competent to speak, that I scarcely like to follow the subject; but I am quite sure of one position in the case, that people ought not to be allowed to let for hire places which they are now allowed to let.

2075. Taking the ordinary rules of supply and demand, and putting out of the question the duty or the inclination of any man to build good cottages as a matter of charity, or as a matter of policy, do you see any way of constructing a cottage to pay which shall be one that people ought to live in?—I have not myself any experience in cottage building, but it seems to me from what I read that very good cottages can be built on terms which are reasonably remunerative. I speak of course without special experience. I speak merely from what I read as one of the general public with reference to cottage building, but it seems to me that that is the case.

2076. Of course the rule would rather be not what the landlord ought to do, but what would tempt a speculator in the way of cottage building. I mean that the persons who build as a matter of trade ought to get from that cottage a remunerative price in the way of rent?—Yes.

2077. You must hardly go further than that, must you, when you lay down rules for the building of cottages for habitation?—I think that the principle which you have stated would be operative if cottages not properly fit for habitation were suppressed. At present they compete against cottages of a better kind.

2078. And you think it would be possible for the builders to contrive some way of building cottages fit for habitation which would pay, supposing that the others were thrown out of the market?—I think it would.

2079. With regard to the inspection you have already stated, have you not, that there is an evil in having a number of medical inspectors of different kinds throughout the country?—I am not quite sure of that as an universal proposition. There are cases, perhaps, where consolidation could usefully be made with reference to the inspections.

2080. Is there not an inconvenience in there being eight or nine different classes of medical men throughout the country who all inspect to a certain extent and make returns?—If one central authority had in his hands all the health supervision of the country, he would still find it necessary to have several sorts of medical inspectors; that is to say, he would not think it desirable that each inspector should act for all purposes independently. He would certainly think it convenient to have special vaccination inspectors. On the other hand, he would consolidate, no doubt, all the medical and quasi-medical inspections that are made of trades. He would consolidate some other inspections. As far as hospitals are inspected, he probably would not bring hospital inspection into connexion with lunacy inspection. Lunacy inspection, I think, probably would remain a specialty.

2081. But you think that there would be the power of consolidation in many cases, provided the central authority were one?—Yes, I have no doubt of that.

2082. Would not it be the case that that consolidation would lead to a better sort of inspection in consequence of the post itself being more dignified and better paid?—It would lead, I think, to some inspections being better planned.

2083. If you had one man to do three things instead of three men you could afford to pay him better; he would do the work better, and he would have more authority?—Yes.

2084. As to vaccination, is there not some difference between inspectors under the vaccination Acts and inspectors of drains and other local circumstances of a parish? Does not the one set of rules extend over the whole country indifferently, and does not the other depend entirely upon local circumstances?—Vaccination depends very much upon local circumstances, upon the distribution

Simon, Esq., F.R.S.

June 1869.

of population, and so forth; but the other kind of inspection that you speak of—that of sewers and drains, is only in a secondary sense, I suppose, a government business. There are two points of view in which Government may have to do with the drains of a place. If the Government is asked to sanction a mortgage of the rates for the construction of a system of sewerage, it satisfies itself whether the system is a proper one. In cases of this sort the matter is referred to the Local Act Government Office, which satisfies itself whether the proposed system is suitable. Another case is where the public health of a locality has suffered, and where the finding of the medical investigators is, that the place has suffered in its health because its refuse is not removed—that the population suffers from excremental poisoning. Then the Government deals with the drain question only in a secondary way. It says in effect to the locality, "Get rid of your dirt effec- "tively. We do not care how you get rid of it. Your "means we do not care about as long as you effectually "attain the result." If an order is to be made in the matter, details as to drainage may of course be involved in that order, otherwise it is the end, not the means, that Government is interested in. I think that Government primarily has not anything to do with the means. If the result can be got by earth closets, if it can be got by carts, if it can be got by porters carrying refuse on their shoulders, it is no affair of Government, so long as the result is obtained. It is only, I think, on results that Government is entitled to insist: namely, that there shall be freedom from nuisance.

2085. In the one case government interference does not arise until the health is affected, but in such a case as vaccination it does not apply vaccination to a place because there is small-pox there, but generally over the whole country without reference to the sanitary state of the place itself?—Yes, in the same way that it applies the nuisance law uniformly over the country, and says to all local authorities "You "must keep your place free from nuisance," but only criticises the means where the end is not attained.

2086. But supposing that the doctor in some place thought, which many people do think, that vaccination is a bad thing, and said that he would keep out small-pox without vaccination, the Government would not listen to that, but they would say, would they not, you must vaccinate?—Yes.

2087. There is therefore that distinction between the two cases?—Yes, there is that distinction.

2088. But do you think that such a distinction between the two cases would prevent the same inspector being inspector of drainage and inspector for vaccination purposes?—They would be officers of different training; the inspector of sewers is an engineer, and the inspector of vaccination is a doctor.

2089. The object of my question was to elicit your opinion as much as possible as to the maximum of condensation that we can get in inspection for sanitary purposes?—Then I think that those two classes of inspectors must be held as essentially separate.

2090. Laying down as a general rule that the work you want done is simply for the health of the people in the place?—Yes.

2091. Do you think that local laboratories would be necessary for testing water, food, drugs, and things of that sort?—Yes. The view I take of that part of the subject is, that in every quarter sessions division of the country there should be a public analyst appointed by the justices with certain definite duties to fulfil under the Adulteration of Food Act, and in relation to public supplies of water, and perhaps in aid of coroners' courts.

2092. Does the Adulteration of Food Act now take in drugs?—Drugs were brought under its operation by the Pharmacy Act of last session.

2093. (*Lord Robert Montagu.*) You said, did you not, that the General Board of Health some years ago administered the Public Health and the Diseases Prevention Acts?—Yes.

2094. The functions were of two sorts, the one function being municipal control, and the other function being medical action?—That was so.

2095. When the General Board of Health was broken up the one function of municipal control was transferred, was it not, to the Home Office?—Yes.

2096. Was that because it was cognate to the other duties of the Home Office?—I presume so.

2097. And the medical action was transferred to the Privy Council because it was cognate to the ancient duties of the Privy Council?—Yes.

2098. Is not the vice-president of the council considered as an essential lord of the council when any of those sanitary duties are performed by the Privy Council?—He is.

2099. In fact he is the minister of health just as he is the minister of education?—Quite so.

2100. Since the Board of Health was broken up various Acts of Parliament have been passed, have they not, by which the Legislature has recognized that it is the duty of the Privy Council to look after the health of the people?—The Legislature has sometimes acted in that sense, and sometimes in a conflicting sense, sometimes giving such power to the Home Secretary, and sometimes to the Privy Council.

2101. The Privy Council now administers, does it not, the Diseases Prevention Act, for instance, in the case of a great outbreak of cholera?—Yes.

2102. And it also administers the Public Vaccination Act, which applies to 3,500 separate districts?—Yes.

2103. And also the Medical Act of 1858, by which the medical profession is governed, I believe?—Yes.

2104. It also institutes inquiries in matters concerning the public health, does it not?—Yes.

2105. So that every year you make a report to the Privy Council on the inefficiencies of the sanitary laws, with suggestions for the improvement of those laws, and you carry on investigations into the causes and the natures of diseases?—Yes.

2106. As to the question to which central office all those duties should be transferred, it has been suggested to transfer them to the Home Office and to the Privy Council, but I presume as lying between these two offices, it is merely a question as to how much other work either the Home Office or the Privy Council, as the case may be, has to transact?—My department, considered separately, might equally well be under either chief minister.

2107. Have you any other reasons for transferring those medical duties to the Home Office than merely the question as to the amount of duties which the Home Office and the Privy Council relatively perform?—The only reason for which I think it almost inevitable that my office should be transferred to the Home Office is, that apparently the other offices cannot be transferred from the Home Office to the Privy Council Office.

2108. You mean the Local Government Office?—Yes, not only the local government but some of the inspections. I think it desirable that I should be under the same minister with the factory inspectors. There are parts of the factory law which certainly ought to be worked as part of the health administration of the country, recent parts which have originated from our office, and in consequence of health inquiries made there; and those parts where we, as it were, overlap the Factory Commission would I have no doubt be more conveniently worked if we were under the same chief minister.

2109. That objection would equally apply to having a separate medical department, would it not?—If under a separate minister, yes.

2110. If you had a separate medical department would you not equally have to take away from the Home Office the local government action and also the factory laws?—But I presume that they cannot be taken away from the Home Office.

2111. Then you would not have a separate medical department?—Yes, under the Home Secretary, not left isolated under the Privy Council while various

other offices more or less referring to health are under the Home Secretary.

2112. But your objection applies equally to a separate medical department; it must be under the Home Office you say?—I think so. I think that the chief minister of health must be the minister who is over the General Register Office, over the Local Government Act Office, over the Factories, and so forth.

2113. Will you explain to me what you meant by saying that the board of guardians as a larger body is more tangible for sanitary matters than any parish authority?—There are doubts I find in some parishes as to what is meant by a vestry for the purposes of the Act. But at any rate an ordinary vestry has no permanent officer. It meets perhaps once a year and then has *pro tempore* a chairman; but when it is not actually sitting it is difficult to say whether is has a chairman, and it certainly may have no clerk. If you want to communicate with an ordinary vestry in the interval of its annual sittings, how are you to communicate with it unless you go down and nail your letter on the church door.

2114. Your answer has no reference to the size of the authority, has it?—The board of guardians is an authority which always has a definite existence under known legal conditions, and always has a local habitation, and always has several officers with whom one can communicate.

2115. Your answer applies to that alone, and not to the size of the body?—No, not to the numerical body.

2116. Why did you say that you considered that the board of guardians should act in committees, because that the board generally is not fit to act in sanitary matters?—I had no intention at all of saying that it was not fit to act in sanitary matters, but that acting for a very large area it could act more effectively if it appointed committees for divisions of its area; and it might be easily provided that such committees might have added to them, as circumstances should suggest, men not members of the original board of guardians.

2117. (*Sir Thomas Watson.*) What sort of knowledge in your opinion should be required of public health officers or officers of public medicine, and how would you test that knowledge?—If our medical examining boards were all that we hope they presently will be, if the General Medical Council were as effective as no doubt some day it will be, doubtless there would be a degree or qualification of some kind given in these branches of knowledge; so that a member of the medical profession wishing to obtain a certificate of special qualification in health studies, would be able to obtain that qualification at the London University, or College of Physicians, or at some other such tribunal, and then the law could easily make it a condition, directly or indirectly, that this special qualification should be had by every proposed officer of health. I say directly or indirectly, because it might be that the best form of law in which provision for the special qualification of officers of health could be made, would be that the central authority should be empowered to fix conditions of qualification for the office. I am disposed to think that that would be the best form that the law could take; and then of course if the medical examining bodies were to make such provision as I contemplate, that provision would be specially recognized in the central authority's conditions.

2118. Have you had an opportunity of forming an opinion as to the comparative advantages of earth latrines, waterclosts, and ordinary privies?—We are investigating that question at present and I am not at present prepared to speak decidedly on all parts of the subject.

2119. (*Mr. Powell.*) Are you of opinion that the central authority should exercise any power over the appointment, dismissal, salary, and duties of the local medical officers throughout the country, or would you leave it entirely in the hands of the local authority?—I see that there is great difficulty in leaving it absolutely in the hands of local authorities, but yet, on the other hand, I see very great difficulty in enabling a government office to fix rates of remuneration for local officers. I think that the central authority should have power to fix the qualifications, that no man should be appointed to the office unless he has certain qualifications. Perhaps even the appointment and removal might require to be approved by the central authority; but even then there would remain this weak point in the case, that the local authority, if it had a grudge against its officer, could reduce his remuneration to a very low scale. But if that difficulty is to be guarded against, I think it must be rather by direct legislation than by giving control to the central authority. There might be a general rule as to the proportion between the remuneration and the number of population included within the officer's jurisdiction. If that would be possible I should see no objection to it. Otherwise I confess that I do not think it very desirable that the ordinary rules of the market should be interfered with in respect of the commodity of medical officers any more than in respect of other commodities, that the Government should fix a price for medical services as distinguished from other services. Such a system would, I think, be to treat the profession as if it had not reasonable power to hold its own.

2120. Would you define the point which you have mentioned by statute or by an order?—By an order.

2121. (*Mr. Hibbert.*) Have you considered the difficulty, in case the guardians are made the health authority in country districts, that they would be, as it were, under two masters, and would have to report both to the Poor Law Board and to the Home Office; do not you think that some difficulty might arise?—I do not think that that would be a difficulty. There would be entirely different objects. The board would be acting in two capacities, and might keep different sets of books for the two different subject matters. I suppose that this must now be done more or less in many cases where town councils act as local boards.

2122. Would not this difficulty arise in respect of the salary, for instance, that now you cannot alter the salary of any poor law officer without reporting it to the Poor Law Board, and it might be necessary to increase the salary for health purposes. How would you get over that difficulty. Would you leave the power with the Poor Law Board?—It might be necessary that the addition to be made for health services should be to the satisfaction of a fixed legal standard, or of the central health authority, but then of course with the obvious understanding that the Home Secretary (if he were the health authority) would be in communication with the Poor Law Board on such a subject. Or it might be that local health expenses would be paid out of special rates with which the Poor Law Board might have nothing to do.

2123. Do you not think that the duties might often clash in case they were under the two offices?—I do not see that they could easily do so.

2124. With respect to another point, you are aware, I presume, that there are large districts within the Poor Law Unions which are under Local Government Acts, would you give the guardians in those districts the power of interfering with the other districts which were not under Local Government Acts?—My notion about the minimum action of officers of health is this: that wherever a special health district is constituted, the law ought to require a special officer of health; and that in all places outside special health districts, that is to say, in all common country districts such as you are speaking of, each Poor Law Officer should be an officer of health within his own medical relief district, so far as not including any part of a special health district.

2125. You have guardians elected from each parish in the union, and some of those parishes in the union may be under the Local Government Acts would you give the control of the sanitary matters of any other parishes that were not under the Local Government Act to

the whole of the guardians of that union; is it not rather separating what is now considered to be an object, that is to say, representation and taxation going together, to give the whole of the guardians the power over districts which they are not said to represent?—That is a point which had not occurred to me as a difficulty.

2126. But are you aware that there are in many parishes districts which are under the Local Government Act?—Yes. If that should be felt as a probable difficulty, I suppose it would be easy to provide that guardians so related should not be members of the local board when acting as a board of health. Or the committee system which I suggest could be well adapted to meet this case.

2127. I presume you are aware that the salaries of those officers are paid from the different parishes; how would you get over the difficulty of paying the salaries with respect to parishes which were under the Local Government Act; if they were called upon to contribute they would be contributing twice over?—In the same way as the expenses now incurred by the board when acting as nuisance authority.

2128. Did you not say that you would have the medical officers of the union to act as the health officers?—Yes.

2129. How would you pay their salaries?—In the same way as the expenses are now paid which are incurred under the Nuisance Removal Act in the parts for which those officers would be acting. I assume a separate nuisance rate for so much of the union as is not included in the special district.

2130. Then you would require to have a kind of double salary, a salary for poor law purposes, and a salary for health purposes?—Yes.

2131. Would not it be better, taking your basis of poor law unions, to have a board specially elected for purposes of health, instead of combining it with poor relief, taking the same area as the poor law unions?—You would lose some important advantages, I think, by that plan. In having the destitution authority as it stands, you have its officers, you have especially its clerk, who is generally if not always a legal officer, and it might be a pity to lose him. There would be very little change of the existing system.

2132. Would not it be possible for the new board to make arrangements with the clerk of the poor law union, and to make use of the medical officers of the poor law union for their purposes?—It would be easy to make arrangements, but unless the law provided for such arrangements being made, they might or might not be made; and if the law did provide it, this would be exactly what I propose.

2133. With respect to the Lunacy Commissioners, I see by a reply that you gave the other day that you suggest that they might be placed under the Home Office?—They are under the Home Office now.

2134. Is it not a fact that they are under no authority, either of the Home Office or of any other minister?—They are subject to the Home Office, but, except as regards filling vacancies and certain appeals to the Home Secretary, I suppose they may be regarded as a separate department.

2135. I believe that they do not consider themselves to be placed under any overriding authority; but would not it be better to have the Lunacy Commissioners placed entirely under the authority of the Poor Law Board, the Poor Law Board having already the treatment of lunatics in the workhouses?—I do not think that the Poor Law Board should inspect lunatics generally; but so far as lunatics are destitute persons, so far I presume they are under the charge of the Poor Law Board and ought to be.

2136. Would not it be desirable to have both destitute lunatics, as well as other lunatics, placed under one authority?—But if under one authority I think not under the Poor Law Board.

2137. Then you think it is desirable to take away destitute lunatics from the control of the Poor Law Board?—Of the two courses, yes.

2138. But is it not objectionable that they should now be under two different authorities?—I think hardly objectionable. For present administrative purposes, destitution is to be looked at, I think, as a unity, as one object, as one head of classification. Ordinary poor law medical relief must be considered as a mere sub-section of that section. So I think also must pauper lunacy.

2139. Is it not objectionable that the accommodation in the workhouses for lunatics should have to pass not only the Poor Law Board but also the Lunacy Commissioners?—That rather forms part I think of the very difficult question whether medical relief altogether ought to go with the relief of destitution or not. I confess I do not see my way to separating them, although I know it to have been very strongly urged before parliamentary committees and elsewhere that a separation should be made.

2140. (*Lieut.-Col. Ewart.*) You are aware, I presume, that in certain classes of government inquiries it is a common custom to send down two commissioners or inspectors of different professions to make a combined report. Supposing that health arrangements were carried out under the Home Secretary, would not you have the advantage of securing more prompt action by sending down an engineer inspector and a medical inspector associated for important inquiries?—In some cases that would be a convenience, and in some cases we have by friendly concert with the Local Government Act Office done that; but speaking generally I do not think that we want two inspectors at once.

2141. You would be able at once, would you not, to adopt that course of action if you had both classes of inspection, the engineering class and the medical class, under the same Secretary of State?—Yes.

2142. You have spoken of the question of extending the Contagious Diseases Act; are you aware whether or not it has had a very beneficial effect upon the health of the army and navy where it has been brought into operation?—I believe that good has been done by it, but I am not able to speak confidently as to the extent of that good with regard to true syphilis. I think that we have not yet sufficient information upon the subject to speak positively about it.

2143. You have not yet had any statistics, I suppose, since the Act came into operation?—I have not seen any statistics that have satisfied me upon that part of the subject.

2144. Have you heard that a difficulty in working it has been experienced in cases in which there is an area not under the Act in the immediate neighbourhood of an area that is under the Act?—Yes, I have heard of that, and I have no doubt that the difficulty ought to be got over for the sake of the law which is being tried. It might very easily be got over in either of two ways. Either the central authority, acting for the purposes of the Contagious Diseases Act, might have ample power given to it to extend areas by an order in council; or the law might stand for the purposes of that Act as it stands for the purposes of military and naval stores, that each given name of a place should include a circle of such and such radius, say 15 miles radius. Either of those arrangements would meet the difficulty, I think, to which you refer.

2145. If the inhabitants of a town situated in the neighbourhood of one of those towns which has been declared under the Act are willing to accept the Act, do you see any objection to their doing so, that is to say, that there should be permissive legislation in that locality?—If your question relates to the civil population, I do see a very serious objection. I think that such legislation would pledge Parliament to the view that to deal with the venereal diseases of the civil population is part of its business, and I think that it should be very chary of accepting that position. If the principle is accepted that it is part of the business of the Government (whether local or central) to deal with the venereal diseases of the common population, I confess for myself that I do not see how that obligation is to be fulfilled. But that principle would be, I think, affirmed, and the consequent responsibility ac-

cepted, if permissive legislation begins. Permissive legislation we all know is a sham in these matters. We know what permissive legislation has been about drainage and water supply, the merest sham. If there were general permissive legislation for local authorities to take action for the sanitary supervision of prostitutes, nothing would be done, but there it would be in the statute book that this was a matter that Parliament felt it right to deal with. The venereal diseases of the civil population cannot be preventively dealt with except by compulsory legislation, and compulsory legislation on a large scale, and I do not see my way to that.

2146. By what department of the State is the Contagious Diseases Act now administered?—By the War Office and Admiralty.

2147. Would you leave that as at present, or supposing you combined the health branches under the Home Office, should you recommend the Home Office to work that also?—No, I should strongly advise the Home Office to have nothing to do with it. I look upon these as purely departmental matters. The position that I would contend for here is, that the cases of the army and navy are special cases; special in two points of view: special because the general public suffers heavily in pocket by the quantity of venereal diseases in the army and navy, and so is pecuniarily interested in stopping those diseases; and special also in this other sense, that the public, keeping for its own purposes great masses of men unmarried, has a sort of moral responsibility for the moral and physical consequences of that mode of life. Those are special cases, and they are departmental cases, and I would let each department deal with its own prostitutes.

2148. But are you aware that the working of the Contagious Diseases Act in any place depends mainly upon the magistracy and the provision of hospital accommodation?—Yes.

2149. Do not you think that that might well come under the same administration as other health matters, as far as the central authority is concerned?—I think that it would be very inconvenient if the Admiralty or the War Office should be able to say to the Home Office, "We want additional accommodation for sick "prostitutes, our prostitute accommodation requires to "be enlarged; will you, the Home Office, construct "an additional hospital for us?" It would I think be a very unworkable state of things that any one department for its own purposes should be able to call upon another department to spend money.

2150. With regard to the question which you answered upon the subject of the ventilation of sewers, do not you think that if you had a sewer thoroughly trapped, with discharges probably below low-water mark, it is preferable to have a special shaft ventilation to having merely a rain-water pipe ventilation for the sewer?—I guarded myself against saying mere rain-water ventilation even for any case.

2151. Do not you think that there is great risk in rain-water ventilation when you consider that rain pipes are often put together with open joints and are liable to breakages, to become disconnected with the walls, and to pass windows?—They are liable to those risks, but any such danger to the house as compared with the danger of an unventilated drain with its atmosphere under pressure ready to escape into the house as often as the watercloset is used, is insignificant.

2152. In fact you mean that a rain-water pipe is better than nothing?—Very greatly so.

2153. But if you had the choice of proper shaft ventilation you would prefer, would you not, the shaft ventilation?—I think that the one does not in any degree exclude the other. A system of sewers ought to be ventilated very extensively at every convenient place. Generally speaking it has ventilation, and ought to have very abundant ventilation, apart from houses; but in addition, I think that the rain-water pipes should also be a mode of ventilation, such ventilation being a special safeguard for the house.

2154. Supposing you carried out a system of local health authorities throughout the country, do you not think that it would be desirable that there should be some system of inspection of houses and cottages, especially those which would be occupied by lodgers?—Yes, I should quite include that under the ordinary duties of a nuisance authority.

2155. (*Mr. Cave.*) Is there any provision in the law for the payment of the expense of extending medical relief to those persons who are above paupers?—Under the Diseases Prevention Act there is.

2156. Under that Act, in the case of sailors on board ship, I think the captain is responsible for the expense; but is there any provision for the payment of expenses in any other part of the Act?—I apprehend that the power of giving medical relief is universal. I have always regarded it so.

2157. And then the expenses fall upon the rates?—Yes.

2158. (*Mr. Whitbread.*) With regard to the prevention of contagious diseases, do you believe that on the continent, and in countries where very strict regulations are in existence with the view of preventing the spread of contagious diseases, there is any real security obtained thereby?—I should like to be able to answer that question with precise quantities, but materials do not exist for so answering it. As regards Paris, of which I have heard most, it is said that very large quantities of true syphilis are prevailing; whether a great reduction is made by the system of inspection I cannot say.

2159. But very strict regulations are at the same time in force in Paris?—Strict regulations are in force, far stricter regulations than it would be easy to get applicable here; but the Paris system professes to break down with the difficulty of what is called clandestine prostitution; there being very large numbers of venereally diseased women who cannot be defined as prostitutes for the purposes of the system.

2160. I daresay you have seen some returns from Gibraltar upon the subject, and you are aware that at Gibraltar the strictest regulations are in force, extending even to the power of banishing women from the rock altogether, and that there is at the same time an alarming amount of disease prevalent?—I am not accurately informed of those statistics.

2161. (*Lord Robert Montagu.*) Are you aware that there is no provision of the kind existing in Rome?—I am not aware.

2162. Have you heard that there was a very great difference in the health of the French soldiers in that respect during the time when they were in France, and when they were in Rome?—I am not cognisant of the French report upon that subject.

2163. (*Mr. Whitbread.*) Have you not seen some statistics which were procured some years ago upon this subject through the Foreign Office, which brought one to the conclusion that relying only upon the statistics, the existence of very strict law upon the subject was in reality not preventive of disease?—I have not yet completely mastered those statistics, so that I do not like to speak about them. But without reference to such materials as have been referred to, which I think are very imperfect, the knowledge that the medical profession has of the laws of syphilis tells me that there would be great difficulty in suppressing syphilis by means of any inspection of prostitutes.

2164. (*Mr. Paget.*) In answer to one of the questions put to you by Sir Thomas Watson, you spoke of a difficulty in respect of patronage and payment in the appointment of inspectors. Have you considered whether a system could be established by which the inspectors of large districts could be appointed by the Government rather than by the local authorities?—A certain number of government inspectors could easily be and ought to be appointed as general superintending officers, acting over large areas; but the every-day sanitary duties of districts, the giving of such medical services as would be wanted in aid of the nuisance authority, the certifying of the causes of death with reference to persons who had not had

Simon, Esq., F.R.S.
June 1869.

medical attendance during life, and duties of that sort, could not be done by Government officers.

2165. Would you think it advisable that every part of England, if brought into districts, should be under the inspection of some one appointed by the central authority who might have district inspectors acting under him?—Yes.

2166. So that no part should be free from inspection by some person wholly disinterested in the district?—Quite so.

2167. Who should not be liable to appointment or to reprimand or to dismissal by any local authority?—Quite so.

2168. Have you formed any opinion as to what number of inspectors of that class would be required for the whole country?—I should think a very good supervision of the nuisance authorities of the country could be maintained with eight, and at first, while feeling one's way with such a system and getting it into work, probably one would prefer not to have quite so many as that.

2169. By nuisance authorities I presume you mean the nuisance authorities with the enlarged powers which you suggest that they should possess?—Yes, certainly.

2170. Can you state at all what you think would be a reasonable stipend for each such inspector?—At present prices you might probably estimate his salary and expenses together at from 1,200*l.* to 1,400*l.* a year.

2171. That would be on condition, would it not, that he should nowhere pursue private practice?—Yes.

2172. You would set him entirely free from all other work in his profession?—Yes.

2173. A question was asked you with respect to the education which you would think necessary for those inspectors. Do you hold very strongly with the opinion that they should be specially educated for the purpose?—They should certainly be specially qualified for the purpose, but if by "educated" you mean that they should have gone through particular courses of study which you could beforehand define in precise terms, certainly not. The best of all preparations for such an office might have consisted in having been officer of health for a district for a certain number of years. In the appointments to which I have already to-day referred, the appointments that have lately been made in our office of two inspectors to act in general sanitary work, the one, Dr. Buchanan, had been physician to the Fever Hospital, and had been officer of health for many years to St. Giles's, and had been working occasionally for us for many years in inspection. Of course those qualifications count for much more than any qualification which one could express in the terms of a medical diploma, as that he was a Fellow of the College of Physicians, or was a doctor of the University of London.

2174. Or if such a title were ever given, a doctor of State medicine?—If there were doctors of State medicine it is very probable that when such a system got into operation, the Government inspectors would be chosen altogether out of that class; but then, within that class, what would determine the choice of the individual would be a knowledge of his individual antecedents, what work he had done, and how he had profited by it.

2175. So that speaking generally it might be expected that you would find as good a class of men for inspectors amongst the generally educated medical profession as amongst any separate class who might be deemed particularly educated for the purpose?—The special education could be acquired by any man of good intelligence and good general education very rapidly, and the other qualities could not.

2176. Do you think that great good would come from the appointment of well-educated inspectors with reference to improving the general conditions of the sanitary law?—Yes, their influence would in that respect be invaluable.

2177. Would they hold anything like the position of general educators of those who work under them?—Yes, eminently. In superintending public vaccination, which we have in the last few years metamorphosed, the good which we have done has been in great part in that way through the educational influence of our inspectors.

2178. I may presume that I am not wrong in thinking that there is still a great deal of work of mere inquiry to be done for the improvement of sanitary science?—A great deal.

2179. Does it appear to you that there is any satisfactory manner in which that can be done except by the appointment of inspectors?—I consider that agency indispensable.

2180. You would not expect it to be done by those who are casually appointed by the local authorities to look after any narrow district?—No, certainly not.

The witness withdrew.

Rayner, Esq.

(12.) Joseph Rayner, Esq., examined.

2181. (*Chairman.*) I think you are at this moment town clerk of Liverpool?—I am, and have been since March 1866.

2182. Have you not been connected with the local government consecutively of Huddersfield, Bradford, and Liverpool?—In Huddersfield from 1851 to 1861. I was not connected with the local government, I was in practice there as a solicitor; our firm were local solicitors for Sir John Ramsden and many of the principal landowners; we were concerned also for some of the local boards in the district, but not for the municipal authority of Huddersfield. At Bradford I was town clerk from 1861 to 1866, and also in practice privately as a solicitor.

2183. Have you also visited Sheffield for the purpose of giving the Commission evidence connected with that town?—I took the opportunity of visiting Sheffield during the Whitsuntide recess mainly for this object; Sheffield being a very big town and having a very little river, I went to see exactly what their local legislation was, if they had any.

2184. Have you any experience as to the local government of country districts?—I have been concerned for a number of local boards and for surveyors of highways, and against them also, I may say, on many occasions.

2185. Will you give us information relating to Huddersfield, with which you were connected more or less from the year 1851 to 1861, and first of all, can you tell us the population of Huddersfield?—The population of the township of Huddersfield in 1851 was 30,876, and in 1861 34,874, and the estimated population of the borough of Huddersfield, which was only incorporated on the 7th of July last, is 73,000.

2186. What is the area of the borough which was incorporated last year?—The area within the borough is 10,476 acres, and that includes the township of Huddersfield and certain townships and part of a township in Almondbury; they have embraced a district on the other side of the river Colne, which is the boundary of the parish and township of Huddersfield.

2187. What is the local government of Huddersfield in sanitary matters?—The local government of Huddersfield in sanitary matters up to the present time is the Huddersfield Improvement Act of 1848, which incorporated the Towns Improvement Clauses Act and the Commissioners Clauses Act, with certain special requirements, one of them being that the lord of the manor, who is the owner of the soil of nearly the whole town, has power to appoint three out of 21 commissioners. There is no special health legislation except under the Towns Improvement Clauses Act, but as all property is held under leases from Sir John Ramsden, there was not much necessity for it as regards buildings.

2188. When you said that there was a Local Government Act at the present time, do you mean that which has existed since the incorporation?—There is now an incorporation under the Municipal Act.

2189. What would be the local authority under that Act?—The local authority of course is now the town council, to whom the powers of the commissioners have been transferred, but they have not done more than that. They have a bill now in Parliament for an increased water supply, but beyond that they have done nothing but get the powers of the commissioners transferred. There were byelaws in some parts of the district which are incorporated with the borough, building byelaws and street byelaws, but none in Huddersfield itself.

2190. The town council, then, will not have the power which the Local Government Acts would give it?—No, not until they have adopted the Local Government Act. I believe they have not done that yet. They can do it at any time by resolution by a certain majority, and they can adopt the whole or part, as they think fit.

2191. Will you tell us, from your own experience, how the former local government acted upon different subjects, taking in the first place building matters?—With regard to Huddersfield, there were no building regulations at all in force, nor are there any now, but in the adjoining townships which have now been taken into the borough, there were building byelaws which are somewhat similar to the model form issued from the Local Government Act Office. There is nothing special in any of them.

2192. How has the water supply of Huddersfield been regulated?—It has been regulated under local Acts. The scheme has been a very small one up to the present time, the capital being only 50,000*l.*, but the corporation have now a water bill before Parliament to get them a larger supply from an independent district. And with respect to byelaws the only observation which I have to make is this—that they propose to take what I have not noticed before, namely, to take powers, and very absolute and peremptory powers, with regard to byelaws, to prevent waste and contamination, and misuse of water, and the abuse of it in a variety of ways, which I think is very desirable. It is just one of those subjects upon which byelaws may from time to time be properly made.

2193. Do they adopt byelaws from the model form of byelaws?—No, I have not noticed that subject to be dealt with by byelaws before. In Liverpool we dealt with it by special legislation in addition to the Waterworks Clauses Act, and in Bradford also. I have never noticed any such power in the model byelaws, but I think it is a very effective provision.

2194. What is the nature of the water supply of Huddersfield?—It is a gravitation scheme; the gathering ground at present is very limited, the reservoirs are two or three miles from the town, and they are now going some eight or nine miles to the moorland districts, where they will have a larger gathering ground and of course a very much better supply; and they propose to supply the villages they pass through.

2195. What has been the death rate in Huddersfield?—The death rate for the last three years has been 24·4 per 1,000 within the township of Huddersfield, and 23 per 1,000 within the limits of the new borough, of course the enlarged limits including a certain portion of agricultural area.

2196. Is that a high rate?—It is a very moderate rate for a town.

2197. What is the outfall of the drainage in Huddersfield?—The outfall at present is into the river Colne, which is a tributary of the Calder, about a mile below the centre of the town.

2198. And the drainage goes into the river?—Yes, the drainage goes into the river, hitherto without objection, I believe.

2199. What is the plan as to waterclosets?—They are very small in number; taking the whole number of privies and waterclosets, 1 in 15 is the proportion of waterclosets.

2200. Proceeding to Sheffield, how is Sheffield governed?—Sheffield is governed by a town council acting as a local board of health, the water supply being in the hands of a company, and they have made byelaws under the powers of the 34th section of the Local Government Act.

2201. What have you to say about their byelaws?—They are upon the model that was issued from the Local Government Act Office, with certain amendments; there is nothing special in them.

2202. How has the local government acted as to different subjects of local government; first, as to slaughter-houses?—The slaughtering of cattle and sheep is in public slaughter-houses belonging to the Duke of Norfolk, but as to other animals it is done in private slaughter-houses, and in the butchers' shops. I visited the slaughter-houses, and I was not very favourably impressed with the condition of the public slaughter-houses; I did not visit the private ones. I may say that Sheffield is as free from special local legislation as any large town that I know. Under the Local Government Act the town council are the local board of health, and they have made byelaws with regard to slaughter-houses, streets, buildings, hackney carriages, and a variety of other matters—all matters upon which most towns generally make byelaws.

2203. As to Bradford, where you were town clerk from 1861 to 1866, what is the area of the borough?—6,508 acres.

2204. What is the population?—The estimated population in 1868 is 134,000.

2205. When was Bradford incorporated?—It was incorporated on the 9th of June 1847. Bradford is a most remarkable instance of increase of population. In 1801 the population was only 13,264, in 1841 it was 66,715, and at the census of 1861 it was 106,218. Bradford is very favourably situated for taking statistics, because it comprises exactly four townships. The boundaries of the borough are conterminous with the boundaries of the union, so that there can be no mistake about the statistics that have been taken from time to time.

2206. Do you mean that the Bradford poor law union comprises four townships?—Yes, it comprises four townships, and the four townships comprise the borough, so that the boundaries are as convenient as it is possible to have them.

2207. What is the local government of Bradford?—The local government is by a charter granted on the 9th of June 1847, and by the Bradford Improvement Act of 1850, under which the council were constituted the local board of health, and of course they took the benefit of the subsequent Local Government Acts of 1858 and 1861 in their entirety.

2208. What public Acts does the Improvement Act incorporate?—The Improvement Act, 1850, incorporated the principal parts of the Public Health Act, 1848, the Towns Police Clauses Act, 1847, the Towns Improvement Clauses Act, 1847, the Gasworks Clauses Act, 1847, and Markets and Fairs Clauses Act 1847.

2209. In fact almost all the Clauses Acts of that year?—Yes, almost all that had been previously passed, were incorporated.

2210. How is the water supply of Bradford regulated?—The water supply of Bradford is regulated mainly by the Corporation Waterworks Act, 1854; that was amended in 1858, and again in 1862, but substantially the supply is under the Act of 1854.

2211. Was that a local Bradford Act?—Yes. It is a gravitation scheme exclusively, the source of supply being a large spring in one of the valleys running into Airedale, and large gathering grounds both in Airedale and Wharfedale, and the compensation reservoirs for the millowners are upon separate gathering grounds; that is to say, they do not deliver so much compensation water from their reservoirs, but they give the millowners a separate gathering ground and reservoir for themselves, and then they are free from all further

responsibility. Whether the supply is sufficient for the millowners or not, is of no moment to the corporation.

2212. What is the provision of the Bradford Waterworks Act as to easements?—There is a special provision in that Act which is found very useful of taking a conduit by way of easement, not by way of purchasing the fee simple. There was some evidence given upon that before this Commission by Mr. Norris, the town clerk of Halifax. In the Bradford Act there was a special power to take easements. In the first Dewsbury Waterworks Act they had not that power. In the Public Health Act, substantially it is a question of easement, because the board have power to put down sewers upon payment of compensation; but there really is no difference except in this way, that if the Act of Parliament does not say that the authority is not to fence off, that is to say, if it leaves it open to the claimant to contend, that if the board take the fee simple, the local authority may fence off, then of course it lets in the claim for severance, and upon that ground I have claimed severance. I was concerned in the first Dewsbury Waterworks Act for Sir Joseph Radcliffe and other landowners, and I claimed severance all along the line; whereas if they had got the Bradford clause they would have avoided all that; but except that, it makes no difference whether you take an easement or the fee. The main point in assessing compensation is this, whether your sewer or your conduit, whichever it may be, passes at such a level as that it will interfere with the cellarage of the property when it becomes building ground, and as to the probabilities of its becoming building ground, those are really the tests. I think it is very desirable that all public bodies should have power to take an easement, and not be compelled to buy the fee.

2213. What do you say about the Bradford building byelaws?—The Bradford building byelaws were only passed in 1860, and they led to a great deal of agitation, which was just concluded when I left in March 1866; and they were re-enacted in the following June, I think, with certain concessions. In 1865 there was a very great scarcity of dwellings in Bradford, which was attributed to the action of the byelaw of 1860, which required positively and without any discretion, a certain open space at the rear or side of each house; and the effect of that byelaw was to prevent a class of house that had been built until that time, that is to say, back to back houses in long rows, either with the privies congregated at one end, or with the privies behind the back house, and with passages through from the street. Of course the effect of that byelaw, without any discretion being reserved to the town council, was to prevent any houses being built of that sort. You cannot build more than four back to back houses, if you are to have an open space at the rear or side of each house. I do not think that that was the cause of the scarcity, but the agitation led to certain concessions which were to a great extent temporary, that is to say, with regard to land which had been laid out, or which the owner was under covenant to lay out in a particular way, having regard to the class of house, the back to back house, which was built at that time, and there was also a concession upon certain special and stringent conditions, so as to secure a certain distance between the door or window and the privy and ashpit, and a certain distance between the street and the privy and ashpit.

2214. (*Mr. Powell.*) Have those concessions proved satisfactory?—I believe so. I believe Mr. Ripley has built a very large number since the alteration was made in the byelaws.

2215. (*Chairman.*) Are those back to back houses?—No, his are not; but I think people under covenants who had land set out, have built upon it under the concession. Mr. Ripley has observed the byelaws; I believe he has observed the byelaws of 1860. He has not availed himself of the concession. With regard to street improvements at Bradford, I may mention that they have all been carried out under provisional orders under the 75th section of the Local Government Act of 1858, and improvements to the extent probably of 200,000*l.* have been carried out.

2216. Are the council the burial board?—Yes, they are the burial board, and they have also established baths and wash-houses, and in the year I left they acquired the fairs and markets also, so that they have now everything connected with municipal government except the gas, which is in the hands of a company. They have got the markets, the fairs, the water; everything, in fact, except the gas.

2217. Now we will proceed to Liverpool; what is the area of the borough of Liverpool?—The area of the borough is 5,210 acres, built upon 4,149, and unbuilt upon only 1,061 acres.

2218. What is the population?—The population in 1861 was 437,740, and it is now estimated to be 500,000 as nearly as can be calculated.

2219. What is the sanitary local government of Liverpool?—The sanitary local government is under three local Acts, the Sanitary Act of 1846, the Amendment Act of 1854, and the Amendment Act of 1864, which is a special piece of legislation. The local Act of 1846 deals practically with all the matters that are dealt with by the Public Health Act of 1848, and the local Act of 1854 is an amending Act; the two together comprise substantially, with certain exceptions, all the powers in the Public Health Act of 1848, the Local Government Act of 1858, and the first Nuisances Removal Act; it was in fact local legislation just in anticipation of the public legislation.

2220. I suppose in Liverpool we may say that the whole local government is administered without any interference on the part of the central government?—Not altogether so, for instance, we are under the Sanitary Act of 1866, and we had an inquiry under the 49th section. We are subject to the general Acts to a great extent; I may mention that there are just two exceptions which are important in a sanitary point of view; the first is that under the Act of 1846 the council are absolutely required to remove all soil, ashes, rubbish, and filth from the houses of the inhabitants, whilst under the Local Government Act, the local board may either contract for removal or may make byelaws compelling the inhabitants to remove them for themselves. The Act of 1846 also contained a requirement as to the cubical contents, or, at all events, the superficial area of dwelling houses, *i.e.* of one room in a house, and of the window. With those two exceptions I do not think there is anything materially different from the public Acts of 1848 and 1858.

2221. Do you mean that those are the only two points in which there is anything in which the law of Liverpool differs from the general law?—Substantially those are the only two very material points; there is another point which perhaps might be usefully annexed to the public Acts. I understand that the use of offensive matter in filling up ground has been prohibited since 1846; it has been such a great nuisance in some of the outlying districts of Liverpool, St. Helen's, and places where they accumulate large quantities of chemical refuse. It is prohibited by penalties under the local Act of 1846.

2222. Was there not at one time a very large cellar population in Liverpool?—There was.

2223. How is that now?—The requirements as to the cellars are pretty much the same as they are in the Public Health Act; cellars in courts are absolutely prohibited by our local Act.

2224. When was that prohibition passed?—That was in 1846, I think.

2225. In fact there is no population living in cellars now?—I am sorry to say that there are yet cellars, that is, cellars which comply with the provisions of the Act, of which a certain proportion is above the level of the ground; the absolute prohibition of them is restricted to cellars in courts.

2226. What is the requirement of your Act with regard to the size of rooms in houses?—That each

house must have at least one room containing 108 square feet, which is a very moderate requirement, and one window of certain dimensions, to open to the extent of one half of the whole area of the window.

2227. What is the requirement of your local Act as to waterclosets?—The 15th section of the local Act of 1854 has been held by the Court of Queen's Bench to entitle the corporation absolutely to require the conversion of privies into waterclosets if they think fit, in the case of Rook *v.* Higgins, and the same decision was come to by the court under one of the Metropolitan Acts.

2228. Practically, have waterclosets been substituted for privies?—To a very large extent.

2229. Even amongst the poorer dwellings?—Chiefly amongst the poorer dwellings. There are no less than 13,229 which have been converted under this clause in the local Act, from December the 31st, 1862 to the end of 1868.

2230. Is it found to work satisfactorily upon the poorer dwellings, where waterclosets can be adopted?—The opinion of our medical officer of health is very strongly in favour of them. But perhaps I ought to mention that in Liverpool we have this, we first of all have a very fair water supply; and, secondly, we have a complete system of sewerage, and the sewers are well ventilated; and, thirdly, we have got a tidal river with a very great scour, which takes everything clean away to sea.

2231. Do you drain into the river?—Yes, but there is an intercepting sewer, which takes the sewage now down towards the north end of the town. The sewers do not run as they formerly did, straight to the river to the west, but there is an intercepting sewer which takes the sewage to a point some distance down below.

2232. But at that point the river is polluted with all your sewage?—It all goes into the river at present, but we have a utilization scheme which is just commencing.

2233. What is the provision in the local Act as to smoke?—As to smoke we have a very excellent provision taken from one of the early Metropolitan Acts, which we think quite sufficient for our purposes, with the exception perhaps of steamers that are sea-going steamers; we find a little difficulty with them, but practically, I think, there is not much to complain of. There are very few manufactories in Liverpool.

2234. Is your smoke generally consumed?—It is consumed so far as it can practicably be consumed, but we very rarely have to take any proceedings, except against steamers, and, less frequently, against sugar refiners and bakers; we have occasionally had informations against manufacturers, but very rarely, and we have found generally that the fault has arisen from the neglect on the part of the workmen, and that the appliances have been sufficient if they have been properly worked.

2235. Is it the fact that you did not proceed against them, or is it that the smoke nuisance was removed?—We have proceeded against every one, with the exception of one or two cases of iron foundries where we found our powers not sufficient.

2236. How far do your provisions as to smoke differ from those in the Smoke Prevention Act of 1866?—We find it better to proceed under our local Act than under the Sanitary Act of 1866. I think chiefly because we get a little higher penalties, which have a more deterrent effect under our local Act, and we avoid preliminary notices.

2237. In what particulars do your powers fall short as to dealing with iron foundries?—Because I think we could not prove before the magistrates that they had not consumed their smoke as far as was reasonably practicable. There has been a decision which is reported from Birmingham upon that subject. The words there, I think are the same, "as far as possible."

2238. What are the sanitary provisions of the public Acts and the Local Government Act which the council have adopted?—The only sanitary provisions of the Public Health Act, and the Local Government Act, are sections 64 of the Public Health Act as to offensive trades; section 76 of the same Act, and section 51 of the Local Government Act of 1858, as to the supply of water; section 28 of the Local Government Act of 1861, containing a provision with respect to the bringing forward of buildings; section 32 of the same Act of 1861, paragraph 4, enabling the council to make byelaws for the prevention of certain nuisances, and a portion of section 34 enabling the council to make byelaws with respect to new buildings.

2239. Under the building byelaw what provision is made as to spaces around dwelling houses?—We require a minimum open space of 150 square feet, with a certain width across at the rear or side of each dwelling house, which prevents back to back houses.

2240. What is your provision as to paying compensation for the demolition of houses with a view to improvement?—We have a special Act, the Liverpool Sanitary Amendment Act, 1864, under which the medical officer of health makes a presentment to the town council as to the demolition of certain buildings, and upon that being confirmed by the quarter sessions the demolition takes place, the owner having the option of either keeping the site or not as he chooses, the corporation paying full compensation for the house that is demolished. That power has been exercised to a very large extent.

2241. Do you believe that that is a single instance of a local Act making such a provision?—I am not sure whether Glasgow has not got a similar Act, but it is the first—I will hand in the last report of the medical officer (*handing in the same*). He reports that it is necessary to knock out one or two houses here and there; that is, of course, to improve the ventilation.

2242. How far do these provisions which you have described coincide with the provisions of the Artisans and Labourers' Dwelling Houses Act, 1868?—The powers in Liverpool have been applied chiefly to courts. Until I have seen Mr. Torrens's Act tested I should doubt whether it would not prove a dead letter. I will explain to the Commission how it strikes me. In our sanitary Act the word "premises" means "a court of houses," but in Mr. Torrens's Act you will find that "premises" means "a dwelling house or inhabited building." It is very easy for a medical officer to say, and for the grand jury to find, that a court of houses, taking the court as a whole, is unfit for human habitation without one or two houses being knocked down, and the privies, which are generally at the entrances to courts on both sides, being taken away altogether, and waterclosets substituted in a different place; but when you come to deal with Mr. Torrens's Act it would be a difficult thing to persuade a jury to find that any one house is unfit for habitation, because it is not a house in itself regarded as a single house, but it is a cluster of houses, regarded as a court, which constitutes "premises" unfit for habitation. I should be very much afraid that Mr. Torrens's Act will not prove of any advantage.

2243. Would not that necessitate proceeding against all the houses, and supposing there was a cluster of unhealthy houses, under Mr Torrens's Act the proceedings would be against each of them?—Yes, but it would be very difficult to say that any one of those houses was unfit for habitation, speaking merely of the particular house.

2244. You mean that it does not provide against putting the houses so close together?—No. Mr. Torrens's Act is founded upon a sound principle, ours is not founded upon a sound principle, because with us we have to pay the whole compensation to be assessed under the Lands Clauses Act, which is an expensive proceeding in dealing with a court of houses. In taking a single court of houses under the Lands Clauses Act, if we do not settle it, the costs are more than the house is worth, a great deal. But Mr. Torrens's Act is founded upon a sound principle, that is to say, that the owner must pay the whole of the costs and make his property fit for habitation. Our

T. Rayner, Esq.
June 1869.

local Act is not justifiable upon any principle, but it has been a very good expedient, and we have done a great deal of good under it, there is no question about that. I may mention that we have spent about 70,000*l.* under the Presentment Act of 1864 in dealing with houses. The average valuation under the last was only 70*l.* We have dealt with about 700 cases.

2245. Have you ever had any litigation on questions of compensation, or any attempts at fraud upon you?—We have scarcely had a single case of compensation under the Sanitary Amendment Act of 1864. Of course it would be our policy to give people 50 per cent. over the real value sooner than go to the Lands Clauses Act to assess the compensation.

2246. Might not a man almost attempt a fraud upon you by building with a view to compensation?—No, I think not. There are no court houses now being built, and this Act has been exclusively, or almost exclusively, applied to the removal of courts. The old Liverpool courts are built with very narrow entrances, and, as a rule, the privies are arranged on each side of the entrance, so that by the only access of the air to the court, it has to run the gauntlet of the privies on each side and there was no thoroughfare, so that they were very bad places indeed until this Act came into operation.

2247. Have you passed special Acts for the purpose of widening streets?—Yes, we have passed a great many Acts, the last three Acts for that purpose being the Acts of 1864, 1865, and 1867; and there is no doubt that the execution of the improvements under those Acts has very materially improved the health of the town, by driving new streets through densely populated districts. The expenditure under the Act of 1864 is 550,000*l.*, which is only just completed, under the Act of 1865 it is 200,000*l.*, and under the Act of 1867 the borrowing powers are 700,000*l.*, making altogether under the three Acts 1,450,000*l.*, and the amount actually expended up to the 31st of August last under the three Acts was 538,867*l.* We have scarcely begun the Act of 1867 yet. Under these Acts I may mention that the Lands Clauses Act is the process, and it is incorporated, but the Act of 1867 does contain some special provisions, the first of which I would mention is the 34th section, for improving the lines of streets. It is to the same purport but much more effective than the 35th section of the Local Government Act, 1858, and in two or three respects it is a much better power than the 35th section.

2248. In what respect is it better?—Under the Local Government Act (we had an illustration of it at Bradford) you can only give notice to improve the line when the building is actually down, and you require to be very sharp sometimes to get your notice approved by the council and given to the man just at the moment when his building is down and he has not begun to rebuild, because you cannot refuse to approve his building plan. The consequence of this was that we had a great deal of trouble at Bradford. That is prevented under our section, because we may give him notice when we first get intimation, without the building being down, so that he cannot begin to build it up again. Secondly, under the Local Government Act there is no power to add to your street the ground that you cut off by the improved line; it remains the property of the man, and you have to pay him the same compensation probably, as if you took the ground for the street, because that property might have a building put upon it. The most important thing is this, that under this section and under another section in the Towns Improvement Clauses Act there is no power whatever to enforce the Act except by indictment. There are several cases reported of indictment. There is one leading case of the Queen against Fulford, where a man was indicted for bringing forward his house beyond the line of the house next door to him. We have taken care in our Act of 1867 to take penal clauses inflicting penalties, and also giving us power to pull down if he should build in spite of the notice. I may mention that I think there should be some more economical mode of assessing compensation in those cases than the present one. The only mode of assessing compensation, if the parties disagree, is the Lands Clauses Act, which is a frightful penalty upon everybody who exercises it in small matters.

2249. What would you suggest?—I should think the county court or some local tribunal might settle the matter. It is simply giving compensation for improving the line of street, that is to say, for taking a slice off the front when the house is taken down. You do not meddle with the house under our Act of Parliament till it is taken down, but you may give the notice before it is taken down.

2250. What are your regulations as to cattle?—We also in our Act have special provisions with regard to the driving of cattle through the streets, all of which are very important, and we find that they work very usefully. We take power to license all places for keeping cattle (including in the term "cattle" "pigs,") within the borough, which we find exceedingly useful.

2251. What is your regulation as to slaughter-houses?—As to slaughter-houses there is a good deal of complaint that our legislation requires amendment. We tried, and succeeded in the House of Commons in getting a bill to abolish altogether slaughtering in the town; but I am sorry to say that we were defeated in the House of Lords two years ago. We had made admirable arrangements, as we thought, for one slaughter-house outside the town altogether. We brought a very large mass of evidence from Brussels and Paris, Edinburgh and Glasgow; and after a fight of five or six days in the House of Commons we succeeded in getting our bill against both the butchers and the slaughter-house proprietors and the local board of West Derby; but in the House of Lords we failed, although we had only one opponent there. I could not tell the reason why we failed.

2252. What is your position as to the composition for sanitary rates in lieu of those contained in the Act of 1854?—We have simplified the composition clauses in this way, that we now take the composition definitely upon one-half of the parochial assessment of property not exceeding 13*l.* net yearly rateable value. Formerly there was a provision that the owner might send in a claim to compound within a certain time after the rate was made, and there was a great deal of complication; but we have now simplified it, and the result financially is pretty much the same, there is no practical difference.

2253. How is the water supply of Liverpool regulated?—The water supply is regulated by a great many Acts of Parliament, the first being in the year 1847, which has been amended from time to time in 1850, 1852, 1855, 1860, 1862, and 1866. It is a gravitation scheme mainly, that is to say, a gravitation scheme as regards all the new works which the corporation has made. There were some pumping works in the town which we took from some old companies, which we have improved to a certain extent; but substantially it is a gravitation scheme. There are some special provisions in the Act of 1866 with regard to the prevention of waste by compelling the providing of cisterns, and also by supplying courts of houses by stand pipes instead of by pipes into each house, which we find very useful. I doubt very much whether it is prudent to put in a water supply under great pressure to small houses. It has led to two things; first, to a great waste of water, and secondly, to great dampness of the walls; and the consequence is that we are now putting stand pipes in courts, from which every inhabitant of the court can draw, instead of putting a pipe into each tenement.

2254. What is the annual expenditure and interest on capital?—At present we have a permanent rate of 6*d.* in the pound, and a poundage water rent also in the nature of a rate of 6¾*d.*; outside the borough that is 9¾*d.*, there being no 6*d.* rate outside the borough.

2255. Can you state the aggregate amount of expenditure of rates for local government purposes, together with the rateable value, and also how much a rate of 1*d.* in the pound in Liverpool amounts to?—

The following SUMMARY comprises this information in a tabular form.

No.	Name of Rate.	Rate in the £.			Total Amount of Rate in the Parish of Liverpool.			Total Amount of Rate realised throughout the Borough, the Poundage Rates being a little different in the out Townships forming part of the Borough.

2256. What has been done in the way of utilization of sewage at Liverpool?—A company has been formed, under the Liverpool Sewage Utilization Act, 1866, with a capital of half a million, to which the corporation have made a concession of the sewage of the borough for a term of 25 years, upon certain terms as to participating in the profits after a certain per-centage is paid upon the capital of the company, and the town council have also subscribed 5,000*l.* towards the capital of the company, as shareholders under the power contained, I think, in the General Act of 1867.

2257. What is the method by which they intend to carry out the utilization?—One section of the work is just complete now. They have taken possession of one sewer, and by pumping they propose to raise the sewage to one level, and then it is to be thrown over a sandy district at the mouth of the Mersey, about nine or ten miles from Liverpool, falling by gravitation after very little pumping at Liverpool. They have taken a farm of about 60 acres, on which they propose to experiment in the first instance, and I think that the first section of the works is about complete.

2258. Is the sewage running?—No, it is not actually running; but in a fortnight or three weeks it will be in operation. They have taken possession of the sewer from that district where privies have been converted into waterclosets.

2259. What is the death rate in Liverpool?—The death rate according to Dr. Trench's last return is 29·1 in the thousand.

2260. Are you aware of the death rate in Manchester?—From the same returns it was 32 last year.

2261. So that the Liverpool death rate is more favourable than Manchester?—At that time it was. I would not undertake to say that at the present moment it is so.

2262. Has this local government which you have described generally worked satisfactorily, do you think, or does it require amendment?—I think it has worked satisfactorily upon the whole.

2263. Twenty-nine is a high death rate; what should you say was the cause of the death rate in Liverpool being higher than the average?—Liverpool has a great many exceptional circumstances to contend with; owing to the very great mass of those court houses the density of population is considerable. I have compared the death rate and the density of population of all the large towns throughout England, and I have a very strong opinion that, as a rule, the death rate and the density of population run pretty much together, and that other causes do not countervail that; I think that is the paramount cause of high death rate. There is also one exceptionable circumstance connected with Liverpool in connexion with emigration of the lowest class of the labouring population who flock to Liverpool, and there is a great Irish population.

2264. I suppose that where the Irish live is about the densest part of the population?—Yes, it is the most dense part of the population.

2265. Is it to one particular part of Liverpool that your remark about the dense population applies?—No, to the whole borough taken altogether. You will remember that I mentioned that there is only one-fifth part of the whole area of the borough that is unbuilt upon.

2266. Do you think that what the local authorities ought to aim at is the spreading out of the population?—I think that the greatest good that can be done to old towns is by giving facilities for opening out the population and widening the streets, and requiring the owners of houses if possible to bring them into that state in which they would be built if they had to be built under the existing legislation. There are two evils to contend with; first of all, by the public streets being too narrow, or too short, or in the wrong direction, or by an insufficiency in the number of them. That is the first point, and the second is by insufficient open space being left for circulation of air around each house. Of course until lately there was

no law as to that subject, that is to say, until our byelaw.

2267. Do the artisans make much use of railroads to live outside the town?—Not very much at present.

2268. Is it an increasing habit?—In Liverpool it has not been tested, but I think that it will be very soon. There is a proposal, I believe, to build a large number of dwellings. The greatest facility and encouragement should be given in every possible way to carry out improvements. We go on very slowly indeed in Liverpool. I think that the corporation do perhaps as much as any other town in England, but still the process is very slow. I have some suggestions to offer upon that subject, both as to the principle and to the machinery by which it should be done, if the Commission think fit to hear them.

2269. Have you made much use of provisional orders under the 75th section of the Local Government Act?—Not in Liverpool at all, but I may mention that there is no objection to do it. I think that a preliminary local inquiry is useful in all cases of an application for a local Act. I think that it strengthens a good case, and it exposes the weakness of a bad one, which are both very beneficial things.

2270. Why have not you made use of the provisions of the 75th section?—In the first place, we have never adopted the 75th section of the Local Government Act, and there is a little doubt as to whether you can adopt a particular section, or whether, if you adopt a part of the Local Government Act, you are not bound to adopt the whole of the part that is under one heading. And then again, I may say we never had to go for street improvements without having to go for other matters as well, which we could not have got under a provisional order.

2271. Has there been any decision as to the power of adopting a part of the Local Government Act without adopting the whole heading?—There has been no decision, and until lately I did not doubt that we had the power to take a single section; that is to say, if you took a section which applies to the whole subject matter. I should not think you were justified in picking out a section and leaving other sections which dealt with the same subject. I may instance the 34th section of the Act of 1858, which enables us to make byelaws. I should never have doubted till lately, when the doubt was suggested to me, that we had power to take the 34th section, in order to make byelaws under it, without taking anything else. The Act is not quite divided, as the Lands Clauses Act is, into separate parts by distinct headings; it is only divided into separate parts by a sort of marginal heading.

2272. Have you any further suggestion to make as to the alteration of the law with regard to street lines?—I may say that I have a strong opinion that street improvements are very important sanitary works, more particularly in towns such as Liverpool and Manchester, and other large towns which were built, and in which the streets were laid out before there was any law upon the subject. At present the practice of Parliament is not quite uniform. Sometimes they cut down the promoters to the street line, and at other times they allow them to schedule a sufficient depth to get the benefit of the new frontages. That is advantageous in two ways. In the first place it enables you to recoup the cost to some extent, and in the second place it ensures new buildings along both lines of the new improved street, which is a very great advantage. You get all the old buildings demolished for a considerable depth in the line of the new street, and you compel them to be re-erected in accordance with your present regulations as to buildings. I remember the instance of Victoria Street, in Nottingham, where the owners could not agree with each other for a long time after the improvement was carried out, and there a gap was left in the street. The line having intersected the property, left a narrow strip belonging to one owner, not sufficient to be utilized for any purpose, and leaving the old buildings behind.

2273. Would you propose that the local authorities should be permitted to acquire property in cases of difference?—Yes, to a reasonable depth. It has been done this session in the Leeds case; it was refused to Bradford under one of the provisional orders. One of the provisional orders for Bradford was taken before a committee of the House of Commons, and the power was refused.

2274. Do you know what the practice of America is upon that point?—In the State of New York, I understand, they go to the other extreme, and that is inequitable. According to the law there, they levy the whole costs of the improvement upon the owners of property who, they say, are benefited, that is to say, upon the owners of property adjoining within a certain radius. I think that there is a certain proportion of the cost which should be levied in that way, and a certain proportion which should be paid by the municipality.

2275. Have you any suggestions to make as to the machinery?—Yes. The present machinery for carrying out these improvements is exceedingly expensive and unsatisfactory. The Lands Clauses Act, I think, was passed to meet the case of taking property compulsorily for some commercial profit, that is to say, taking it by railway companies and bodies of that sort; but I think it is too harsh in its application to the case of taking by municipalities for the benefit of the whole town, and who are punished most severely in a variety of ways; in fact so much so that it leads to disgust, and has a very discouraging effect upon improvements generally. The cost that we incur is something frightful. Under the three Acts which I have mentioned, 1864, 1865, and 1867, our costs up to the 31st of August last were 30,863*l.*

2276. You think that a distinction should be made as to cases of necessary improvements?—I think so. I think that a more equitable mode should be adopted, for instance, we had a case the other day of the taking of a public-house required for the widening of a street. The house belonged to the corporation in the year 1859; it was then a grocer's shop, it was leased, and the lease was renewed to the owner; he bought a licence and transferred it to this place; we have now had to take it, and we have had to compensate him in the first instance, then we compensate the lessee, then we compensate the tenant, and then we compensate the brewer who has got a tie upon the house, and they all took care not to go to the same tribunal, because if we could get the whole of them to one tribunal we should have to pay only the fee simple value in actual possession of the property altogether; but by getting separate tribunals the sum of the parts becomes much greater than the whole, that is to say, the compensation altogether is very much greater than the value of the fee simple in possession. Then, in taking a strip off 20 shops in a street, for widening the street, in cases of that sort, in taking part of them, or the whole of them, as the case may be, we find that every man goes to a separate tribunal; the first man takes an arbitration, the second will take a jury, the third will take a separate arbitration, the fourth a jury, and so on all through; and then the lessees and the occupiers do the same. I was noticing the widening of Church Street, in taking six shops, we had eight separate inquiries, and the cost of the tribunals, and the cost of the inquiries altogether were something frightful.

2277. What is the tribunal to which you would have all such cases referred?—I think that there should be a tribunal named in the Act or the provisional order; I should prefer a provisional order to an Act of Parliament, because I should have the advantage of a local inquiry, and every individual would have an opportunity of being heard; and I should provide by the Act of Parliament or provisional order that the improvements should be divided into sections, and I should ask each owner and lessee, in addition to his assent or dissent, to name an arbitrator, and then I should let the committee on the bill, or the Home Secretary, take an arbitrator from the

returns made for the whole of the owners or lessees, and take another arbitrator named by the promoters, and let a third be named by the Board of Trade, and let them go into the whole thing at once and make an award of what shall be the sum to be paid to the respective parties; that would be much more satisfactory than the present plan, because they would have time to investigate every case, and apply the illustrations of value to the whole. At present in the case of juries, it is quite a lottery, in fact, because you have not time in one day to go into all the illustrations of value that are given, and test them, in the way that the arbitrators would do if they had the question of the whole street to deal with at once.

2278. Why do you go to the Board of Trade?—At present the Board of Trade have a staff of umpires, and they have power, under the Railways Act, to appoint one in case the parties differ.

2279. Do the local Acts in Liverpool and the byelaws in Bradford give sufficient power to the local authorities as to new streets?—I think that subject to the objection which I have to mention to byelaws, altogether, with regard to property, the local Acts and the byelaws give sufficient power to the local authorities without the payment of compensation, but I think that some supplementary law is wanted coupled with compensation.

2280. Would you propose, for instance, that in laying out the lines of new streets the local authorities should have power to enforce their own plans, subject to compensation to the owners?—Yes, in this way. I should first of all not allow the local authority to depart from the landowner's plan, except in requiring a certain width of street and level of street, and so on, as they do now, but supplemental to that I should give them power, upon suitable compensation, to be assessed, to require the direction, width, and extent of the street to be altered. The measure of compensation would be shortly this. First of all, the value of any additional land which was thrown into the street, because a street 30 feet wide might be sufficient for the owner's purpose, but the local board may say we want one 50 feet, because by-and-by it may become a main thoroughfare, so that the first compensation that they must pay him is for the additional land that he has to sacrifice. Then they must pay him also, upon the assessment of the value of two properties, first, laid out according to his plan, and then according to their own, and the loss, if any, which he would sustain by selling according to their plan and not according to his own; I would not interfere in any way with the setting out of the lots.

2281. Might not the plan of the local authority be such an improvement upon the owner's plan as to give them a claim to compensation the other way?—No, I think not, generally. The interest of the owner would often be to throw his neighbour into the background, and keep him there as long as he could. That is a right that he has got from the ownership of his estate, and if you facilitate the opening of the adjoining owner's estate you must pay him a money compensation for the damage which he would sustain. I know that, in rapidly increasing villages in Yorkshire, it sometimes happens that the interest of the owner is to keep his neighbour's land out of the market as long as he can, and to turn the backs of his houses upon him and prevent him getting through if he has got a main line of road. I think also that turnpike roads should be taken out of the exception. At present there is an exception of turnpike roads, which in my experience has led to evil, in this way, that turnpike roads and gates tend to cramp, and limit the building area. I think that the time has arrived for taking turnpike roads out of the exception which the Act contains.

2282. Do you think that the time has arrived generally for an Act to be passed, making such regulations as you suggest for streets and houses, to apply to all places, and to override local Acts?—I can scarcely say to override local Acts, but I think that the time has arrived when it would be very easy to frame a sanitary law applicable to the whole kingdom, to be supplemented in towns by provisional orders, or by byelaws with reference to such matters as come within the province of byelaws.

2283. Should such a general law apply to such large places as Liverpool and Manchester?—I think that large towns must always have supplemental legislation, either by provisional orders or by local Acts.

2284. What sort of sized towns do you mean?—I think there might be a public Act of Parliament applicable to the whole country, which would satisfy all the requirements of towns up to probably 10,000 inhabitants, or nearly that number.

2285. What suggestion have you to make as to byelaws?—I agree substantially with the town clerk of Halifax and the town clerk of Ipswich, but for rather different reasons. I consider that byelaws should be limited to such matters as slaughter-houses, hackney carriages, lodging houses, and matters of that sort. I object, on principle, to byelaws to regulate buildings or streets, because I think that should be the subject of positive enactment, and I do not see any difficulty about it. I think that there might be a little concession made in some cases, as there was at Bradford, with regard to land laid out, or covenanted to be laid out, before the proposed general Act came into operation, but beyond that, I am sure that people would submit much more readily to a specific law than to byelaws, which can be waived, amended, or altered at the discretion of the local boards. I should make all regulations as to streets and buildings the subject of enactment, and, as far as possible, without any discretion, or with discretion within very narrow limits.

2286. You think that there still would be a margin as regards discretion with the best general code of byelaws inserted in a statute?—I would not have it so if I could help it.

2287. Do not you think that it would be necessary to leave a certain margin for byelaws in the locality?—It might be done in this way, you would say with reference to land which has been laid out or covenanted to be laid out by the owner before the Act came into operation, that the local sanitary authority might make a certain concession, with the sanction of the Home Secretary, or some matter of that sort, but beyond this there is very great difficulty about byelaws. I have never seen a set yet which would stand the test of a court, nor have I seen a set which I would have approved, irrespective of their standing the test of any court of law; I believe that whenever they have been taken to the Court of Queen's Bench they have always been held bad, for this reason, that the courts have tried them by the test applicable to byelaws irrespective of statutory authority; they must be reasonable, they must be certain, they must be definite, and they must be without arbitrary discretion. When the court comes to look at them and test them by those rules, they invariably find them bad. I have never known one yet which has not been held bad.

2288. Therefore, generally speaking, you would wish byelaws to be made more part of the statute law and definite?—Yes.

2289. You make the exception which you have just made as to lodging houses, slaughter-houses, hackney carriages, and certain matters of that kind; those are matters which are very easily dealt with by byelaws?—You may easily make a legal byelaw, and from time to time find it necessary to make little alterations and concessions.

2290. Which do you think the best central authority to preside over all the local governments in the kingdom?—The best central authority is the Home Secretary, or a minister of health having a seat in Parliament. With regard to the local authority I have several suggestions to make.

2291. What suggestions have you to make?—With regard to the local authority, I should disturb matters as little as possible; one principle, I think, must be adhered to, and that is, that roads and sewers, and all sanitary matters except the Diseases Prevention Act, must go together. What I should propose would be

J. Rayner, Esq.

3 June 1869.

this—beginning with the basis of a general Act applicable to the whole country, and to be supplemented only when necessary in towns, I should make the highway surveyors or the highway board the local authority, not the highway surveyors as now appointed, but a board, (call it the local sanitary board, or the local sanitary authority perhaps would be better,) varying in number with the population. For instance, if you got a population of 3,000, probably five would be sufficient, or, if you got a population of 5,000, seven would be sufficient. Then I would make all the county justices who were eligible for election to the board *ex officio* members of that board, if they chose to act, that is to say, if they would accept the duty.

2292. For what sort of area would you propose this authority?—I would not disturb the existing areas; taking country districts, I would take every place that maintains its own highways, subject to the Home Secretary's power to divide and consolidate.

2293. Your last answer does not apply to towns?—In towns you have already got one of three things; you have either got a municipal authority, a board of improvement commissioners, or a local board of health.

2294. As far as large towns, like Liverpool, Manchester, Birmingham, and so on, are concerned, do you think that there is any alteration required in the local authority?—No, I think not; we find that the parochial authority for the Diseases Prevention Act where it is put in force, and the municipal authority for all other matters connected with health, work exceedingly well.

2295. Is there any alteration necessary in the relation between the local authority, in a town like Liverpool, and the central authority?—We have no objection whatever to the 49th section of the Sanitary Act of 1866, which gives the Home Secretary power to send down an inspector to report, and also to take action, if the local authority fails in its duty; but we should certainly object, and I think the country would generally object, either to a board of inspectors for the country, or to inspectors who would be constantly making inquiries, or investigating without any complaints or without an excessive death rate.

2296. You think that the alterations required by law chiefly relate to country districts?—I think so.

2297. You have had some experience, have you not, as to the local government of country districts?—Yes, up to 1866 I had more experience in country districts than in towns.

2298. And there you think local government defective?—I think, for instance, the board of guardians as the nuisance authority is quite ineffective; it is a mixture of incongruous duties. The board of guardians have to attend to the relief of the poor, whereas the highway surveyors have already got, under the Highway Act of 1835, certain powers connected with drains, and also with reference to nuisances. They have also got appliances, plant, and servants to do all works connected with matters of that sort.

2299. Would you in any case give power to the vestry to make works relating to one particular parish?—The vestry is rather a difficult term to apply. The whole of England is divided into districts for highway purposes; in some places it is a parish, in other places it is a township, and in most places in the north of England it is only a hamlet; that is, a part of a township, and I shall take those districts just as they stand, giving the county justices in petty sessions jurisdiction over those places of less than 5,000 inhabitants, and I would allow them to a certain extent, as they have under the Highway Act, power to inflict penalties to a certain extent, and also, if necessary, to approve of complaints to the Home Secretary, who would send down an inspector under the 49th section of the Act of 1866; the Home Secretary should also have ample powers to sub-divide, consolidate, and rearrange districts from time to time.

2300. Supposing there was an intermediate authority established between the central office in London and the local boards throughout the kingdom, such as has been suggested in the proposed county financial boards, which would be a department of the quarter sessions, do you think that such an intermediate body could have any relations whatever with a town like Liverpool?—I do not, and I do not think it necessary in country districts.

2301. At all events large towns could not be dealt with by such a body?—I do not think they would submit to it.

2302. What is your opinion as to the constitution of the conservancy boards of rivers?—I think that you must now have a conservancy board either with reference to the whole watershed of each large river, or, taking the West Riding, as an example, cutting it up into about three separate conservancy boards. You might take the Aire and Calder for one probably, the Wharfe for another, and the Ouse for a third, the Ouse Conservancy Board taking the whole, when you get to the confluence of the others, and when it becomes the Ouse altogether, and I think that that conservancy board should be limited to three objects, and not interfere with sewerage. I think, first of all, they should prevent flooding and store up waters by impounding reservoirs near heads of valleys where the water is perfectly pure. I think that is a most desirable thing, and that only a conservancy board for the whole watershed could accomplish that. They should also preserve the bed of the streams free from obstruction, and the water from pollution; and thirdly, they might provide water power to mills, and water supply to local authorities, and levy rates upon works and places along the valleys which they supply with power or water. I think that a board of that sort would be exceedingly valuable.

2303. Do I understand you to think that the same conservancy board could deal with all those subjects?—Yes, with those three subjects, but not to interfere with sanitary matters, except in those respects.

2304. Would you let them interfere also with the arterial drainage of a valley?—I do not think the Conservancy Board should interfere with that. All they should take care of would be that nobody should put anything in except what was pure water.

2305. Why should not the same board take care of the rivers in all respects, both preserving them from pollution, and draining pure water into them?—They would take care that the river was not polluted. That would be one of their duties, but I do not think that such a board could undertake to get rid of the sewerage of large towns. That must be dealt with by the local sanitary authorities, or by unions of local authorities.

2306. Do you see any objection to this Conservancy Board dealing with all questions relating to rivers, both keeping pollution from them, and draining pure water into them from the country round?—I think that they should not interfere with arterial drainage further than preventing anything going in that was not pure. I think that the sewerage can only be dealt with in one of two ways, that is to say, by the separate local authorities or by an union of the local authorities, which are respectively interested under certain circumstances.

2307. Do you think that those conservancy boards should generally be a combination of local authorities?—I think not.

2308. If the parishes or districts which have local authorities happened to coincide in boundaries with the watershed of rivers, it would be so far an advantage, would it not?—I should scarcely like to take the Conservancy Board from the local authorities, because their main duty would be to watch the local authorities, and take care that they did not infringe upon the rights of rivers. I think that the county magistrates in the watershed, that is the county magistrates being the owners of property in each watershed, would make an excellent conservancy board, or, if too numerous, those who have been in

the commission of the peace a certain number of years.

2309. What suggestion have you to make as to finances, particularly as to a sinking fund provision?—First of all, with regard to a sinking fund, the view which I take is this, that with regard to gravitation waterworks there should be no sinking fund at all, but there should, as we have in the Liverpool Acts, be a depreciation fund, that is to say, a sort of contingency fund to provide against any serious accident which might make a great inroad upon one year's income. With regard to improvement schemes, that is, street improvements, I should think 50 years; with regard to main sewerage works, 50 years, or the purchase of land for utilization purposes; and with regard to paving, I think 20 years would be sufficient. There is, at present, great complication about these matters. I may explain, that the Liverpool Acts, the first Sanitary Acts, have got the clause worded in the right way; the clause is that the thirtieth part of the debt from time to time existing should be invested in a sinking fund, and the council may from time to time apply the sinking fund in paying off the borrowed monies, and sell out consols and apply them. Unfortunately in the Improvement Act of 1858 one of the clauses was altered altogether, and it says that the council shall lay by such a sum as will in 50 years, accumulated at compound interest, pay off the debt. That has landed us in this difficulty, the clause as to realising a sinking fund and paying off the debt remaining as in the old Act: our reserve has now got to about 200,000*l.* in the sinking fund, and I wish very much to apply it in reduction of the debt, because we are paying 4¼ per cent. for money and only getting 3 per cent. Of course the borough treasurer would say "No, that would spoil the pro-"blem altogether;" because he has made the calculation that laying by a sinking fund of 18*s.* per cent. will in 50 years pay off the whole debt if you allow it to accumulate at compound interest, but if you disturb it by applying the clause in the Act of 1858, selling out consols and paying off the debt, unless you pay in also the dividends which the fund sold out would have produced from time to time, it would not work out in that way.

2310. What suggestion have you to make as to the stamp duties?—Under the Public Health Act everything is exempt from duty, and the consequence is there is a very serious tax upon the exercise of powers under local Acts, which those who exercise the powers of the Local Government Acts do not feel. I may mention as a striking instance of that, the Wallasey local board, who bought a ferry for 70,000*l.* They took a conveyance, and gave their bonds without stamps, whereas if we had bought the ferry instead of them, our stamp duty would have been 350*l.* upon the transaction.

J. Rayner, Esq.

3 June 1869.

2311. What would you suggest with reference to that point?—That all matters of that sort should be free from duty altogether. Our stamp duties under the last three Improvement Acts will amount to 7,350*l.*

2312. Do you think that by the simplification and consolidation, both of the law and the authorities, economy would arise in the local government?—Yes, I think so.

2313. Do you think that local government is wasted by the multiplication, both of laws and authorities?—Yes, it is got into such a state of confusion that nobody can make head or tail of it.

2314. Is there any complaint in Liverpool as to the increase of rates for local government?—I think not. There has been a little complaint in consequence of our expenditure for conversions of privies into water-closets, but I think it has died away.

2315. (*Mr. Shaw.*) I believe you have adopted the principle of mortuaries in Liverpool?—I am sorry to say that we have not done anything. There was one commenced by Mr. Robert Hutchison, for the Roman Catholics; he began to build a very beautiful mortuary chapel, but at the time of his bankruptcy it was only half finished, and so it has remained. The subject has been discussed, but nothing has been done.

2316. (*Mr. Powell.*) You stated in a former part of your evidence, as I understood you, that there was only one point of discharge of the sewers into the river or the sea; is that really the case?—If I did say so, it was a mistake, the sewers or one of the principal sewers which did discharge in the centre of the town is now altered.

2317. Are all of them intended to be permanent, or is one of them to be caught by an intercepting drain?—I believe they are intended to be intercepted and taken for sewage by the Utilization Company, who have got a concession of the whole of the sewage of the borough.

2318. (*Mr. Bircham.*) Are you carrying out the utilization of sewage yourselves, or are you dealing with some outside company?—We are dealing with a company, but we have as a corporation subscribed 5,000*l.* under the powers in the Public Health Act, 1867.

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

Monday, 7th June 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.	JOHN TOMLINSON HIBBERT, Esq., M.P.
The EARL of DUCIE.	EVAN MATTHEW RICHARDS, Esq., M.P.
The Right Hon. LORD ROBERT MONTAGU, M.P.	FRANCIS SHARP POWELL, Esq.
The Right Hon. STEPHEN CAVE, M.P.	BENJAMIN SHAW, Esq.
Sir THOMAS WATSON, Bart., M.D., F.R.S.	JAMES PAGET, Esq., F.R.S.
Lieut.-Colonel EWART, C.B., R.E.	HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
JOHN ROBINSON MCCLEAN, Esq., M.P.	JOHN LAMBERT, Esq.
SAMUEL WHITBREAD, Esq., M.P.	FRANCIS THOMAS BIRCHAM, Esq.

(13.) JOSEPH HERON, Esq., examined.

J. Heron, Esq.

7 June 1869.

2319. (*Chairman.*) You are town clerk of Manchester, are you not?—I am.

2320. Will you state the condition of the city of Manchester as to existing local sanitary authorities?—The city of Manchester comprises five townships, and a small extra-parochial district called Beswick. The population of the city of Manchester is from 360,000 to 380,000, and the only authority within the city of Manchester for carrying out all powers relating to general, sanitary, or other matters is now the council of the city. We have only within the city exercising their own functions the guardians of the

J. Heron, Esq.
7 June 1869.

townships, and with the exception of the guardians, all powers of every description are vested in and carried out by the town council.

2321. I suppose sanitary matters are carried out by the town council?—Yes, wholly.

2322. The guardians have no power in those matters?—I will not say that they have no power, because there are certain powers in some nuisance Acts given to the guardians to interfere, and no doubt it may be assumed that, as the result of this inquiry, all that possible collision of authority will be done away with; but practically I may say that in Manchester I scarcely know an instance in which in any such matters the guardians have found it necessary in any way to interfere.

2323. Then there might be a conflict of authority, but practically that has not occurred?—No doubt there might, and I do not think there can be any doubt that the possibility of such conflict ought by an improved legislation to be avoided.

2324. What was the date of the incorporation of Manchester?—The date of the incorporation was the latter end of the year 1838, and I am sorry to say that since that period I have acted as town clerk of the city of Manchester.

2325. What are the local Acts which are in force in Manchester?—The local Acts in force I may state are very numerous. We have in fact at the present moment about 22 local Acts which are in force within the city. Our first Act of Parliament was passed, I think, in 1843, but it was an Act passed for the purpose of vesting in the city council the powers and the property including the gasworks, which at that time belonged to the commissioners of police acting under a local Act for the township of Manchester. We had local police Acts in two or three of the other townships, but the powers of such Acts were very shortly after or about the same time, under the powers of the Municipal Act, transferred to the corporation; but in consideration of there being a large amount of property vested in the commissioners of police for the township of Manchester, it was thought desirable to get an Act of Parliament to vest this property in the corporation. The next Act, which was a very long and very important Act, in fact one of the first Acts in relation to general police and sanitary matters which was passed, was passed in the year 1844, a copy of which I now hold in my hand (*producing the same*). That, as the Commission will see, is very lengthy and very comprehensive, and I believe with certain additions which have been made since, and of which we have from time to time availed ourselves, has worked very satisfactorily. That was in 1844. The Public Health Act, which was passed in 1848, was I may say from personal knowledge based very much upon this Act of Parliament, because at that time I as representative of Manchester, as well as the representatives of other corporations, attended in London to state the objections which we entertained to the bill as it was originally introduced into the House at that time by Lord Morpeth, and as a consequence of what took place at that interview, I, with Mr. Brotherton the member for Salford and Mr. Beckett the member for Leeds, attended at Lord Morpeth's request for three days from four to five hours each day going through the original Public Health Bill with the draughtsmen, and I may say that in most cases Lord Morpeth was satisfied that the alterations which we suggested were desirable to be made, and to a very large extent the original Public Health Act, was based upon this local Act which we obtained. At the same time (1844) we obtained also for Manchester an Improvement Act; at that time of course the Lands Clauses Consolidation Act had not been passed (the Lands Clauses Consolidation Act was passed in 1845), but in our Improvement Act of Parliament, lands clauses were introduced, and under those lands clauses we worked for upwards of 20 years; but at last under a sort of gentle compulsion we were required by Lord Redesdale to adopt the General Lands Clauses Act, and to give up our peculiar Lands Clauses Act under which we had been carrying out all our improvements for many years; and in some respects we have suffered very materially from the change, because one of the objections which was stated by the town clerk of Liverpool, and which is a very formidable objection, and which increased enormously the expense of carrying out compulsory works of any kind under the Lands Clauses Act, did not arise under our own lands clauses. It will be recollected that the town clerk of Liverpool referred to the fact which often happens, that in addition to the owner there might be two or three lessees and other parties who are interested in the property, and that under the present Lands Clauses Act each of those parties having an interest can require to be independently heard and considered by in fact a distinct tribunal, so that as it was explained, very often the corporation would find or the local authorities would find that they would pay, by having to pay for parts separately ascertained, a great deal more than any tribunal would ever determine to be the value of the whole. Under our own lands clauses that was not the case. Under those clauses the duty of the jury (for we could go to a jury then, we were not obliged to go to an arbitration at the request of either of the parties which we are under the Lands Clauses Consolidation Act), or of the arbitrator, whichever was preferred, was to ascertain the value of the fee simple, and then having ascertained the value of the property to divide it amongst the different claimants, so that the first inquiry was that in which the local authority was mainly, if not entirely, interested, and afterwards it became a struggle between those who had to divide the plunder in what shares or proportions they were to obtain it, which of course lessened very much the expense.

2326. Did the Lands Clauses Consolidation Act of 1845 make provisions similar to those in your improvement Act of 1844?—Generally, with the distinction which I have just been explaining. I may state that one cause of the enormous expense, I am happy to say, is now got rid of. Under the present law, there is no power of taxing the costs of an arbitration except in the most unsatisfactory manner possible, which in fact amounts to no taxation at all. The costs have to be ascertained by the umpire who may be acting as between the two parties; the umpire is very often a surveyor, or certainly a person who has no knowledge to enable him to do that duty satisfactorily, and very often he is influenced by other considerations which would prevent his dealing with the costs as an officer of the court. I have been for several years trying to get that altered and I am happy to say that this year we have a short bill in Parliament which I prepared and which was introduced by Mr. Bazley with the representatives on the back of the bill also of Liverpool, Birmingham, and other large towns, and by that bill, which is now waiting for the royal assent, we shall have power to tax through the officers of the court the costs of arbitration in the same way as they have always been authorized to tax the costs of an inquiry by means of a jury, and there is no doubt at all that that will very largely reduce the cost of such inquiries.

2327. (*Earl of Romney.*) Is that a public Act?—Yes, it is a public Act, it is now in fact taken up by the Government. Two years ago a clause was obtained in a railway bill to the same effect, but that only applied to inquiries affecting railways, and you will see that by a clause in the bill to which I have referred, and which is now in your Lordships' House, that clause in the railway Act is very properly repealed, because the effect of that bill will be to amend the Lands Clauses Act, which will apply to all parties, railways, corporations, local authorities, and everybody else.

2328. (*Chairman.*) Was that a bill which was introduced by Mr. Hibbert?—No, by Mr. Bazley. Mr. Hibbert's name is on the bill and also that of Mr. Greaves the member for Liverpool, and I think also the member for Birmingham.

2329. (*Mr. Powell.*) It was not a private Act, I believe?—No, it is a public bill; it is an amendment of the Lands Clauses Act, but it repeals, and very properly, a previous amendment and alteration of that Act which had been obtained in a railway bill, only applying to inquiries relating to railways, so that by that bill the general law will be altered, and there is no doubt the effect will be not only enormously to reduce the costs which will be sent in, knowing that there is that power of taxation, but also it will give to the local authorities the power of having them fairly ascertained, and by a competent tribunal.

2330. (*Chairman.*) Does the Manchester Police Regulation Act which you have placed in my hands refer to the borough of Manchester as coincident with the present city of Manchester?—Yes.

2331. What parts of the Public Health Act of 1848 do you say were copied from this Manchester Act of 1844?—Nearly all the clauses.

2332. Do you mean clauses as to power, or as to authorities also?—As to powers only. Of course there was this distinction in the Act of 1848, there was the creation of the board of health, and if it were at all necessary I could show to this Commission the very strong objections which were urged both by Manchester and all other corporations to the very extravagant powers of interference that were originally proposed in the Public Health Bill; but they were to a very large extent got rid of as the result of what I have just stated, but still there were left many clauses that we thought very objectionable, but as they did not materially interfere with us we did not think it necessary to make any strenuous opposition. But those powers I am satisfied led ultimately to the determination on the part of the Government to abolish the general board of health.

2333. Have you any of the other 22 local Acts which you say are still alive in Manchester?—I hand in the Act passed in the year 1845, which has more special reference to sanitary improvements, and in that Act, amongst other clauses, we obtained powers which we had already found, even at that early stage, were desirable by going through a certain process which is prescribed in the Act to take property for sanitary improvements compulsorily, by obtaining the consent of the Secretary of State I do not think that such provisions have been introduced into any other Acts, but I may say that we have never acted upon them. We have found, although at that time we thought they might be useful, that there have been difficulties in the way, and if we did want to obtain powers for improvements of any kind we have included them in our Improvement Acts, and obtained power from Parliament in the usual way. The objection to those clauses is this, that if we had interfered for the purpose of taking property compulsorily for sanitary improvements, we must have paid extravagant compensation, which, as a matter of course, all owners of property obtain from any public body, whether it is a corporation, a local authority, or a railway company, and we should have had to pay those extravagant compensations when we were taking properties which really we had only to interfere with because they were unfit for human habitation to a very large extent. Under the Act which has been recently passed, that is to say, the Artisans and Labourers' Dwellings Act, which I believe will be found practically very useful, and which we are bringing into operation in Manchester to a very large extent, that principle is got rid of. The principle of that Act is this, that the responsibility of making the property fit for human habitation really rests with the proprietor, and that unless his property is in that condition he has no right to be obtaining rent, and that principle is carried out; so that if the local authority has to purchase the property he does not purchase it in the ordinary way, but he purchases it as property actually condemned in consequence of the unsatisfactory condition in which it is found, and that will reduce to a very large extent the amount which under those circumstances would have to be paid by the local authority. I think that that is a perfectly just principle. In addition, the local authority have this power, which in many cases would probably be all that it would be necessary to exercise—they have the power to close absolutely premises as habitations until the owner has made such alterations as in their opinion are absolutely necessary to fit them for residence. As regards other Acts they are very numerous, but I do not think that it is at all necessary to occupy your time by referring specially to them; they relate to all manner of subjects. We have no less than six Acts of Parliament that have been passed relating simply to the waterworks of the corporation. Then we have a variety of Improvement Acts; we have a Burial Board Act. We have also what are called Waterworks and Improvements Acts, in which there are clauses relating not only to the waterworks but also to various other matters, as well as every kind of improvement, and general powers to take property by compulsion. We have also an Act which we obtained for the erection of a new town hall, which was obtained in 1866, and that also contains many other provisions of a general character But I can hand in, if the Commission wish, a copy of the answers that we have given recently to the Rivers Commission. There is much information in such replies, and at the end there is a schedule of all Acts of Parliament in force within the city (*delivering in the same*).

2334. Of those 22 Acts are there any repealing each other?—Not very many repealing; but there are a great number giving additional powers which have from time to time been found to be desirable and necessary.

2335. Have you ever attempted to codify them all?—No, we have not; it would be a work of very great labour. There is no doubt that it would be a considerable advantage to the inhabitants if they were consolidated. I may say that I have been glad that it has not been imposed upon us by Lord Redesdale, because it would be a very great labour, and there would be great danger of our sacrificing some clauses which might be very useful. But I may say with reference even to the Waterworks Clauses Act by way of illustration, that in many of our Acts we have from time to time, as the result of actual experience, found it necessary to get additional provisions, for the purpose of preventing the waste and the stealing and otherwise illegally dealing with our water; and I have no doubt that whenever the general public Waterworks Clauses Act comes to be considered, many clauses that we have introduced into our Acts will be found very desirable to be embodied in any general law.

2336. Has codification been suggested or talked of?—No, it has never been suggested.

2337. May it not be the fact that such a mass of Acts may render people liable to penalties without their being aware of it?—As far as regards the waterworks, for instance, we publish the clauses, showing what penalties parties are liable to in connexion with the waterworks. Then as regards the other provisions, there is no publication of that kind; but they are generally of such a character that parties have not much difficulty in finding out what the law is. I find that they always seem to be very well aware of what the Acts of Parliament authorize us to do, and if by any possibility they can upon a technical or other ground evade our clauses, they are very astute in discovering the means of doing so.

2338. To what extent besides all this mass of local Acts do the public Acts apply to Manchester?—They do not apply at all. We have never in any way—except in one instance in which we introduced some particular clause, I forget which at this moment—adopted any clauses of the public Acts, really because to a very large extent we have found ourselves always in possession of either the same or clauses having similar objects.

2339. Would that apply to the Nuisance Removal Acts?—To a very large extent it would, but we do

J. Heron, Esq.
7 June 1869.

now in some instances, wherever we find that those provisions are in any way superior, carry out the provisions of the Public Acts. For instance, I may say with regard to smoke, we have recently adopted the provision of the Sanitary Act of 1866, section 19, because we find it superior to our own; and perhaps I may as well just call the attention of the Commission to what that clause has really decided. It is not always interpreted or read in the same way, but I have no doubt that the reading which we have put upon it, and it has been so decided repeatedly by the magistrates, is the correct one. By that Act the word "nuisance" is declared to mean absolutely, unequivocally, and without any mode of escape, "any "chimney" (not being the chimney of a private dwelling house) "sending forth black smoke in such "quantity as to be a nuisance." Accordingly every chimney, no matter with what works it may be connected, is by that clause declared under such circumstances to be a nuisance; and we are going continually before the magistrates under that clause, instead of under our own, where the words "as far as practicable" were introduced; all we have to prove and all we do prove is the issuing of black smoke, and I am happy to say that the magistrates generally consider that a comparatively small amount of black smoke is a nuisance and is within the clause, and the magistrates have simply to make their order for the abatement of the nuisance within the period they choose to prescribe, and at the end of that time if the nuisance is again found to exist we go before the magistrates, and they have no duty whatever but to impose the penalty, and there is no question that can arise under that clause as to how far it is practicable, because Parliament has considered that the time had arrived when those words need not be included. The proviso is a little ambiguous, but the proviso it will be found by carefully reading the clause only applies to the furnaces which do not consume the smoke arising from them. That is to say, absolutely and entirely, and it applies to those furnaces which are referred to in the third paragraph—"Any fireplace or "furnace which does not as far as practicable con- "sume the smoke arising from the combustible used "in such fireplace or furnace, and is used within "the district of a nuisance authority for work- "ing engines by steam or in any mill factory," &c. The proviso applies to this paragraph, and in those cases, if the magistrates are satisfied that the owner has done all that is practicable for the purpose of consuming his smoke absolutely and entirely, they can refuse to convict, but as far as regards the black smoke which is declared to be a nuisance that proviso does not at all apply. I may be permitted to add that in my opinion it is very desirable that power should be given to the justices to impose a fine upon the fireman or stoker, as in very many cases the nuisance of smoke entirely arises from the careless and culpable manner in which he performs his duties. The want of this power has often been referred to by the stipendiary magistrate of Manchester.

2340. Have you any remark to make as to the 49th section of the Act of 1866, the section providing for appeal to the Secretary of State where the sewer authority is in fault?—I happen to know perhaps better than anybody else under what circumstances that clause was introduced. In the bill as originally introduced, and also as it passed through the select committee, there were certain clauses introduced, the 14th, 15th, 16th, 17th, and 27th clauses of the bill, by which power was given under certain circumstances to complain to the magistrates that the local authority were not doing their duty in certain cases; but I had better read what those cases were. The 14th section as it originally appeared says, "Where complaint is made to any justice of the "peace that a sewer authority has made default in "providing its district with sufficient sewers, or in "the maintenance of the existing sewers, or in pro- "viding its district with a supply of water in cases "where danger arises to the health of the inhabitants "from the insufficiency or unwholesomeness of the "existing supply, and a proper supply can be obtained "at a reasonable cost, the justice shall issue a sum- "mons to the sewer authority;" and then it goes on to provide in the subsequent clauses what the magistrates might do. They might make an order requiring the local authority to carry out works, and a variety of other things. To these clauses, both as they appeared in the bill in the first instance, and also when it came from the select committee, the corporation of Manchester, and I believe others, objected on this ground. We said that it would be degrading to a very great extent local self-government, and that it would not be possible to get such individuals as would be desirable to act as members of the council if they were liable to be called to account before the local magistrates. When the bill was in committee in the House, and very near the end of the session, finding that those clauses were still in the bill I came up to town, and I am glad to say that I did succeed ultimately in inducing the Secretary of State, having charge of the bill, Mr. Bruce, to consent to omit the clauses to which we objected, and to insert a clause which I, with Mr. Thring, under the gallery of the House prepared. I stated at that time and I still believe that there is no provision of more importance that has ever been inserted in any Sanitary Act. The judicious exercise of the power given to the Secretary of State will often be found most useful in assisting corporations, where they are anxious to do their duty, and also as I believe effective in compelling by the force of public opinion local authorities not so disposed to carry out effectively the powers with which they are invested for public and sanitary objects.

2341. In fact you induced the Government to change the appeal from the justices to the Secretary of State?—Yes, and with this addition: That the power is given in all cases where a local authority makes default in enforcing the provisions of the Nuisance Removal Act, so giving to the Secretary of State complete power to interfere in all cases where he, upon inquiry, might think it was necessary.

2342. It seems to be the opinion of the people of Manchester that they should be dealt with rather as a great metropolitan city, too large to be taken into the provisions of general Acts?—Generally I think it is quite impossible to do away with local legislation.

2343. You think that in any general consolidation of the sanitary laws of the kingdom it would be impossible to take in such large cities as Manchester?—Quite impossible, I think, although I believe that the greatest possible advantage would result from a codification and simplification of all the public Acts dealing with those questions which are interesting to or affecting local authorities, whether large or small.

2344. But still if such a consolidation is carried out you think that large cities like Manchester must have a code of their own?—They must have power to apply to Parliament from time to time as might be necessary, but I believe that the result might be if a codification were made that we may very likely get rid in subsequent legislation of a certain portion of our local legislation, and adopt that which had been determined for the whole country where the clauses were found to be similar, and I have no doubt that they would be quite as satisfactory, if not more so.

2345. Is it your opinion that if a general consolidation of the public sanitary laws of the kingdom was made, a certain part of your local legislation might merge in it?—I have no doubt of it; and although I think it would be undesirable to do that compulsorily, I have no doubt that when that consolidation had taken place it would lead to considerable modification in our local Acts. The authorities that have to deal with the local legislation in both Houses exercise a great amount of care in these matters. I may say that nothing can be more satisfactory in my opinion than the way in which local Acts of Parliament are dealt with, especially in the House of Lords by the present chairman of com-

mittees, who is extremely cautious as to what clauses he will allow you to introduce; and when you cannot show that there has been a clause similar in some public Act, he will put you under the necessity of proving most strongly the necessity for and the grounds upon which you propose any special legislation. I have no doubt that when that simplification and codification of the general law had taken place by that sort of compulsion, local legislation to a very large extent would be simplified, and that the local authorities would be required, probably Manchester as well as Liverpool, to consider to what extent their special local Acts could be repealed without any injury or interference with the necessary powers.

2346. Have you considered to what extent you think the local legislation of Manchester might be reduced by such a merging of those general provisions in a general Act?—I think it would be reduced enormously. For instance, the very Acts that I have handed in to the Commission I think to a very large extent would be found to be no longer necessary.

2347. Would you say that, supposing the general Act was carried out very completely, there might be nothing left for Manchester but what you might call byelaws?—I do not think, unless the power to make byelaws was very largely extended beyond what exists at the present time, that it would do away with the necessity of from time to time coming for local Acts. A great many provisions are found to be necessary that we could not at all obtain by means of byelaws. The power to make byelaws is very limited as compared with the objects for which from time to time we have to get parliamentary powers.

2348. You state that nothing would prevent your having from time to time to come for further powers. My question related chiefly to the existing provisions, whether you think that the law as it now stands might be brought to such perfection in a general Act as to do away with the necessity for any sanitary laws in Manchester, except what may be called byelaws?—Whether you call them byelaws, or leave them as special provisions, the effect would be the same. If such a consolidation took place, our local Acts would be found to be to a very large extent unnecessary, and the number of clauses that we should still desire to retain for rather peculiar or special objects would be so small that the effect would be to do away with the difficulty of ascertaining what the general law was as applicable to Manchester.

2349. Do you think that in that case it would be desirable, in order to make the law clear, intelligible, and well known to everybody in Manchester, that you should repeal all such portions of your local Acts as would be rendered unnecessary by the general Act?—I think it would be better, safer, and save a great deal of trouble, to leave the repealing of those Acts to the local authorities themselves, subject as they would no doubt be to that sort of pressure which is brought to bear upon local authorities from time to time when they come to parliament for the amendment of their Acts. If we came for consolidation it is quite certain that we should have to show Lord Redesdale, and if necessary the authorities in the other House, that there was a reason for continuing any clause which we proposed to continue in force within the city. We should have to show that there were no provisions in the public Act which met that particular case, and in that case we should be allowed in doing away with our special Acts to continue in operation in the same bill such clauses as were found to be wanting, not wanting because they could be applied generally, but simply wanting for the special purpose for which we had required them.

2350. How far in your experience, now extending over 30 years, has the Secretary of State had to interfere with your local administration?—Until section 49 of the Act of 1866 was passed I presume that the Secretary of State had really no power legally to interfere, nor am I aware of any case in which the Secretary of State has found it necessary. We have only had one communication from the Secretary of State since that clause was introduced in the Act of 1866. A most absurd complaint had been sent up to the Secretary of State by some individual ratepayer the particulars of which I entirely forget, but I know that it was a most preposterous thing even to think of troubling the Secretary of State or any of his officers upon such a subject. A copy of the letter was sent down to us. I ascertained what the facts were and sent a full explanation to the Secretary of State, and of course there was an end to it; we never heard of it again. But I think that clearly shows the willingness which must have existed in the Secretary of State's office to deal with the most minute complaint that might be sent in, whereas the Act, as it appears to me, only contemplates his dealing with cases where upon inquiry he thinks that certain special interference is required.

2351. Then you think that no further interference on the part of the Secretary of State is likely to be required by Manchester?—I do not think that any further interference is required, but I am quite of opinion that very extensive additions and alterations ought to be made to the power which is now vested in the Secretary of State, or otherwise it remains open to very many of the objections which have been urged before this Commission; but I think that by comparatively very trifling alterations all those objections might be to a very large extent removed. Certainly my idea was, as I stated at the time, that in 99 cases out of 100 a letter from the Secretary of State to the local authority which was anxious to do its duty would be all that would be required, and very often would be found to be the greatest possible moral support to the corporation. I may take the case of smoke. Of course a local authority in dealing with smoke necessarily treads upon the toes of a good many of those who are perhaps influential people in the community, and there is always a great amount of pressure brought to bear to prevent those powers being carried out. I could mention that that is the condition of many boroughs where they began very zealously to deal with the smoke, but they dropped all their proceedings because they had a sort of intimation given them, in a way which people well understand, that if they attempted to interfere with the business of a great number of people within the community, they would all be sent about their business at the next election. In a case like that, if the Secretary of State had had what he ought to have had, complaint made to him by inhabitants who were suffering from the nuisance, and had sent down a communication to the local authority, I am quite satisfied that in some of the cases to which I refer they would have got over the difficulty at once. They would have had another party, namely, the Secretary of State, reminding the council that if they did not do their duty he would send down somebody to do it for them, which would be much more annoying in all probability than if it were done by the council, and in that way the local authority would be supported. I may mention as an illustration what took place at a meeting of the Social Science Association which was held in Manchester just after the passing of that Act of Parliament of 1866. In the Health Section I heard an influential member of the Birmingham corporation make the statement, that very ample and most satisfactory power was now vested in the Secretary of State; to give an illustration, he said, "I can "tell you what took place in Birmingham, where a "large system as to sewage, involving a large ex- "penditure, was proposed for the purpose of improv- "ing our present condition, and to which we had a "very strong opposition, but we brought forward the "powers which are now vested in the Secretary of "State, and the result was that we secured the unani- "mous decision of the corporation in favour of carry- "ing out a scheme which was so desirable." That is an illustration of what I always believed, and still believe, will be the effect of such controlling power being vested in a high government functionary.

2352. Do you think that the power would often have to be exercised to the extent of compelling by mandamus or otherwise local authorities to do their duty?—I do not think it would, or very rarely indeed. Of course, as I have said, I think that that power requires considerable addition. I would certainly give to the Secretary of State power to make an order in all cases, no matter what it was for, whether it related to the supply of water or the removal of a nuisance of any kind; to make an order which in fact should be final and conclusive, and serve that order upon the board. I cannot see what objection there could be to giving, as was suggested by an honorable member of this Commission, power to apply to the justices to impose continuing penalties upon the local authority, unless they proceeded with due diligence and to the satisfaction of the Secretary of State to carry out the order, either in the terms which might be prescribed by the Secretary of State or in any other way that they could satisfy the Secretary of State would accomplish the object which he had in view; because in that case it would not be giving to the local magistrate any power except to act ministerially in carrying out the order which would proceed from the highest authority. And I do not think that any corporation either would or ought to feel any jealousy of that power being given. In that way it appears to me that it would be a very simple machinery; and I really do not see why it should not be carried out, to enable the Secretary of State to put a district under continuing penalties unless they carried out the works that he might have thought necessary to be constructed.

2353. Do you think that the Secretary of State requires any more information of neglect than he now gets by way of inspection?—That is a question which I am not very well able to answer, but I may say this, speaking for our corporation, and I think I might say the same for others, that we do not object to inspection for the purpose of informing the Secretary of State; he might send an inspector down to Manchester as often as he liked.

2354. Do you think that that would be desirable?—Very often I think it would be desirable, but no doubt the Secretary of State's attention would be, I should think, directed to the neglect or default of corporations even in the absence of any inspection; but I think it very desirable to have increased inspection and increased information.

2355. Do you think that it would be desirable to give to the inhabitants as well as to the local authorities more power to apply to the magistrates for the suppression of nuisances?—If the power does not exist, I certainly think it is very desirable that it should be given. Nuisances may be divided into two classes—public nuisances with which the corporation or the local authority alone could deal, and, secondly, private nuisances, which are rather offensive to individuals than offensive to a district or the inhabitants generally. Inhabitants are disposed to believe or imagine that the local authority is to do every mortal thing for them, and that they have nothing at all to do for themselves. I would withdraw all ground of complaint as far as they are concerned by giving in all cases of private nuisance, which the local authority has power if they think necessary to interfere with, but do not, power to the party aggrieved himself to appeal to the magistrates, of course being subject as he would be to the payment of all the costs if he made an improper and merely vexatious complaint; but I would give him that power in addition to the power which is generally vested under the Act in the local authority.

2356. Do you think that the power of applying to the magistrates on the part of inhabitants should be extended to cases of special nuisances on premises which were not private?—I think that it would be necessary to be very cautious in wording any clause which would give to the inhabitants the power of dealing with those cases. I think that those cases ought to be left rather to the local authority, because I could easily show how there would occur a vast number of cases where it would be very awkward and very difficult to give individual ratepayers the power of disputing or litigating with the authorities. I think that those cases had better be left to the central authority to interfere upon complaint, if the local authority neglected to do its duty.

2357. Supposing the premises belonged to the local authority, who would be likely to make complaint?—I think that plenty of people would make complaint to the Secretary of State very willingly if they had the ground, because it is simply the sending of a letter. I suppose an anonymous communication would not be regarded, but I will mention a case which is in my mind where a local inquiry in Liverpool was instituted by Mr. Taylor, in consequence of a complaint made about the yard for the deposit of the nightsoil before being shipped or sent away from the borough. In Manchester that is one of the great difficulties which we have to contend against. We have not had opposition, but we have had parties down connected with the central department looking at our yard for the purpose of ascertaining how far it was a nuisance, or to what extent any improvement could be made, and I am happy to say that as the result they have generally said that, although it is not the most delightful thing in the world to be looked at, yet the arrangements were such as to prevent what otherwise might be called a nuisance, and it is an absolute necessity that such a place should exist. In a case like that it would be very inconvenient, I think, if a person residing somewhere in the neighbourhood, who probably might have really no serious complaint to make, but still as a mere matter of sentiment might dislike to see it, although we have built our walls so high that they cannot see the deposit of the nightsoil; I say that in that district and in such a case I think it would be certainly undesirable to give to any individual inhabitant the right to bring the local authority before the justices. It is just one of those cases which we are anxious to guard against. We do not want the justices to have under any circumstances a right to become as it were masters of the local authority, because I believe that that would lead to everlasting disputes.

2358. Do you think generally speaking from your experience that the law has been efficient in removing nuisances in Manchester?—I think it is so; I really do think that if the powers are consolidated there is scarcely anything of that kind that could not be dealt with; of course I speak with some degree of diffidence upon the subject.

2359. Can you state the rate of mortality in Manchester?—The rate of mortality in Manchester is certainly not very satisfactory. I observed by the public papers the other day that the rate of mortality in Manchester, and it has been so for several weeks, was 24 per 1,000. In Liverpool during the same week it was 28, in Glasgow 35, and in Edinburgh 39, and in London that week it was 21. Perhaps I may be allowed to read a statement which will be found at page 8 of the paper which I have given in as the answers to the Rivers Pollution Commissioners. We were required to state the rate of mortality, and we give the rate of mortality from 1857 to 1866. We state, and I am desirous of just referring to this, that "The high death rate in "Manchester is largely due to the excessive mortality "in the infant population, nearly one-half of all the "deaths occurring in children under the age of five "years. A large proportion of the children die "within the first year from the want of the care which "is necessary in the earliest months of their existence. "In the years 1851–1860 the total number of deaths "in Manchester and Chorlton from all causes and at "all ages was 74,359, the total under five years "35,963, the total under one year 19,725, or rather "more than one-half the whole infant mortality, and "more than a fourth of the mortality of all ages."

2360. Is that peculiar to Manchester?—It is peculiar, I believe, to Manchester, and probably for this reason. As far as we can judge it arises from the practice of women finding employment in various

ways and leaving their children. Some are known to go to work sometimes within 14 days after the birth of a child, and the children are left to the care of mere hirelings, and I have no doubt a great deal too much of what is usually called "comfort" is given to them. They call it "comfort," I believe, which they apply to the druggist for, and that "comfort" certainly leaves them very often, and very soon with little more liability to discomfort.

2361. Is that mortality chiefly among the very poorest class?—It is chiefly amongst the poorest, not paupers exactly, but the poorest classes. I may be allowed to state that in Chorlton-upon-Medlock, which is a very large township in Manchester, the death rate is only 18 per 1,000; in Cheetham, which is also a large township in Manchester, the death rate is only 16 per 1,000. The districts where the mortality in Manchester is greatest are two; one is chiefly occupied by what you may call the vicious classes, the haunts of thieves and prostitutes and all people of that class, and there is another district which is mainly occupied by the Irish. No sanitary arrangements that can be made will to any very large extent, I believe, affect the condition of those classes—it is something that is beyond the reach of mere sanitary legislation. Manchester is not as a whole an unhealthy town, and I believe if what was suggested was carried out that we should have not only statistics of death, but statistics of sickness; it would then be found that Manchester would compare very favourably with other places. Then again there is this peculiarity, that we have not a large area of rural districts which practically belong to Manchester included within the area for which our death rate is given. I mean rural districts like Broughton—Broughton belongs to Salford and is entirely occupied or nearly so by gentlemen connected with business in Manchester, and for a long time they would not allow a house of under 20*l.* a year to be erected in the township of Broughton. Then, again, Stretford, Bowden, and all those places are occupied by gentlemen who are connected with business in Manchester, but we do not get the benefit of their low rate in determining the death rate of the city.

2362. Do you think it possible that the mortality of Manchester, which even setting aside the number of the population is great, may be attributed to the want of care in smoke consumption and other sanitary regulations?—I have no doubt that this will answer your question; it is a statement made by the officer of health, and it is better than any opinion which I could give. "The mortality at all ages is, however, abnormally great; consumption and diseases of the lungs generally, especially bronchitis, are relatively to the population more fatal than in almost any other locality in England. This is probably due to a considerable extent to the constant irritation produced in the air passages by the dense smoke with which the atmosphere is constantly loaded. Zymotic diseases, including autumnal diarrhœa, also largely swell the death rate." Perhaps I might be allowed just to say in connexion with a subject which has been already before this Commission, that I cannot myself conceive why there should be any obstacle in the way of the guardians giving, in the case of extraordinary diarrhœa, medicine without applying either to the central or to any other board. I may mention what occurred in Manchester when we had diarrhœa a year ago to a very large extent. At the request of the guardians of Chorlton and the guardians of Manchester, we sent up, as we were required, a memorial to the Privy Council to make such an order as would enable the guardians, without being surcharged, to provide at different depôts in the districts where the diarrhœa was most prevailing the proper medicine, free of all cost, for diarrhœa. For reasons which I can hardly understand we did not get the order, but the consequence was (and I believe I may say the Poor Law Board gave a tacit sanction to that being done) the guardians determined that they would make an arrangement to supply gratuitously the proper medicine, but which they were actually supplying at the risk of being surcharged. I believe it was intimated that the Board would not throw any difficulty in the way of their being repaid any expenses of that kind that they incurred. In such cases as these it does appear to me that the cost of medicine would be very trifling, and that guardians might very fairly have the power in any such case of administering medicine, and making any other arrangements which they might think desirable with the view of lessening the evil effects of diarrhœa, because unless the remedy is instantly applied it is no use having it at all.

2363. In your experience are sanitary administrations increasing in Manchester?—No doubt they are increasing. You expressed a wish to know the rates. Perhaps I might as well just state the total. There are five townships within the city. We have a township rate in each township, and a highway rate in each township. A township rate for the purpose of certain expenses which are payable out of the township rate, like scavenging, sewering, and a variety of other charges, and a highway rate for the purposes for which it is necessary. Then we have a city rate, which is for general purposes, and we have other rates to which I will refer. I find that in the township of Hulme altogether the expenditure under the township and highway rates was 9,511*l.*, or equal to a rate of 1*s.* 4*d.* in the 1*l.* The amount in Chorlton for the same purposes was 10,045*l.*, equal to 1*s.* 3*d.* in the 1*l.* The amount in Ardwick was 1*s.* 6*d.* in the 1*l.*, or 4,431*l.* In Beswick, a little extra-parochial district, to which I referred, the rate was 3*s.* 6*d.* in the 1*l.*, 1*s.* being for the township rate and 2*s.* 6*d.* for the highway rate; and no doubt if we could have got the money necessary for the highways in that unfortunate little township we should have wanted 7*s.* 6*d.*, instead of 2*s.* 6*d.*, for it is one of those townships which have been very harshly dealt with by the operation of the law; there are very long turnpike roads cast upon a very thinly-populated township, with very few buildings, and a very low assessment, and of course we can only levy 2*s.* 6*d.* in the 1*l.*, which is quite insufficient for the purposes of the highways. In Cheetham the township and highway rate together was 1*s.* 8*d.* in the 1*l.*, and the amount raised was 6,090*l.* In Manchester the township and highway rate was 1*s.*, and the amount raised was 44,809*l.*, making for the purposes of the township and highway rates an amount of 75,400*l.* levied during one year. In the same year the poor rates of Hulme were 5*s.* 6*d.*; and in the poor rate I may state that the amount required for the city rate, or the borough rate as it is usually called, is included. Our poor rate for Hulme was 5*s.* 6*d.*, making a total of 6*s.* 10*d.* in the year. In Chorlton the poor rate was 4*s.* 4*d.*, making a total of 5*s.* 7*d.* In Ardwick the poor rate was 4*s.*, making a total of 5*s.* 6*d.* In Beswick the poor rate was 2*s.*, making a total of 5*s.* 6*d.* In Cheetham it was 2*s.* 8*d.*, making a total of 4*s.* 4*d.*, and in Manchester 3*s.* 2*d.*, making a total of 4*s.* 2*d.* I may say that the amount of the city rate which had to be raised during the past year, and which of course is divided in proportion to the assessment over different townships included within the corporate area, was 109,000*l.* With regard to the amount of the water rates, perhaps I had better explain that in Manchester the water is distributed upon this principle, and it is the principle that was recommended by the first commission which sat upon the subject of the health of towns. We supply the water to every house within the area of the corporation, and we make two rates, one a public rate, which is paid by all property, whether dwelling houses or other property and the other a domestic rate, which is payable by the dwelling houses only. The corporation are limited in the amount of its rates to the rate which is required to raise the deficiency in the annual expenditure on account of water after giving credit for all amounts received for water sold outside the city for any purpose, whether domestic or trading, and for all water supplied for trading purposes, or for any other voluntary purpose within the city. Then the balance is raised by means of the two rates which

Heron, Esq.
June 1869.

we are authorized to levy, which are compulsory. Supposing that our expenditure was 100,000*l.* a year, for example, and we received 60,000*l.* a year for the purposes which I refer to, we should be authorized to raise a domestic rate and a public rate, which will realize us 40,000*l.* Last year I find that our two rates amounted to just 40,350*l.* in the year. Then the city rate was 109,000*l.*, and that makes the total amount which the corporation raise in one year for general purposes, including water, about 224,716*l.*; which includes in fact all the expenses incurred for public purposes of any kind, including sanitary objects, paid by means of rates.

2364. What would that be in the 1*l.*?—I have already given you the rate in the 1*l.*, with the poor rate added. In such rates the water rate is not included. The domestic water rate is 11*d.* in the 1*l.*, and the public water rate is 3*d.*, but levied upon the assessable value of the property, and not the gross rental, so that practically that would reduce them.

2365. Has that assessment been altered?—Our assessment alters every year by the increased value of property. The gross assessment of the city, I believe, by the last return made for the purposes of the city rate was about in round numbers, 1,500,000*l.*

2366. I mean does the principle of the assessment remain the same?—Yes.

2367. The increased assessment is from the increase of property?—Yes.

2368. And do you think that by a codification of your own law, or a consolidation of the general law, and a simplification generally of local administration, those rates could be reduced?—I think many improvements might be made in the collection of rates. Whether the actual amount required for expenditure would be very much reduced I cannot say, but that a very considerable reduction might take place in the cost, for instance, of collection I am quite certain. Perhaps I might be allowed to illustrate that by this fact, at the very last meeting of our council a notice was upon the paper and I have no doubt it will in future be adopted by the corporation, that clauses should be introduced in the first Act of Parliament, enabling us to collect the township and highway rates precisely as we now collect the city rate, and the estimate was that there would be a saving to the corporation of 3,000*l.* a year by carrying out that arrangement. We collect the poor rate in this way. The overseers make their return of the assessment of each township, we then divide in proportion to the assessment the amount required to be raised, and we issue a precept to the overseers to pay that sum. They include that in the poor rate and pay it, and we have no expense of collection, nor are the ratepayers subjected to the annoyance of the collector coming for the special purpose of collecting the city rate. If the highway rate and the township rate were collected in the same way it would be in my opinion a very great advantage to the ratepayers, because they would see when they got their note what was the total amount of rates that they have to pay during the year; and they would also know that at any rate they have only to be subject to one collector.

2369. Have you any suggestion to make to this Commission with regard to the powers that are required by law in relation to the disposal of sewage and the outfalls?—In order to consider satisfactorily what powers may become desirable, it is almost necessary to refer at any rate to what may possibly or probably be the nature of the duties which by legislation may be cast upon the local authorities. In our answer to the Rivers Pollution Commission we have stated that we feel extreme difficulty in suggesting any mode of dealing with the great question of sewage, and we refer to the fact that the rivers which come into Manchester are of course necessarily largely polluted by the towns above, up to their very origin, through which they pass before they get into Manchester. The sewers in Manchester find their outfall into one or other of the rivers flowing through the city, and the same rivers receive the sewage from a large number of towns and houses, as well as pollution from a large number of manufactories, before they enter Manchester, and it may be questionable whether such streams when they leave Manchester are much worse than when they enter it. If the sewage of towns is to be interfered with, such interference must necessarily extend to the sewage along the whole course of the river; unless artificial means or conduits, as in London, are constructed with a proper outfall into the sea, and into which all local authorities may be compelled to carry the sewage from their respective districts, it is difficult to see in what manner the natural streams and rivers can be protected from pollution. Assuming that something of that kind may be necessary, which it is quite clear will be if by legislation the local authorities are to be deprived of the opportunity which they have hitherto enjoyed, from their first existence, of fouling streams by turning their sewage into the nearest watercourse, it becomes a very important question what sort of power must be vested in some central board or authority that will have practically the dealing with the whole question. Taking our own districts of Manchester and all the towns by which we are surrounded, if any such scheme as this had to be carried out it is quite clear that there must be appointed a representative body that would really represent the whole district and area that drains into those rivers; it would have to be called upon to pay in such proportions as it might be found that they were interested the expense of carrying out the main works. Then if there were the means of getting rid of the sewage by the existence of such works there would be no difficulty. It would become then necessary for the local authorities to carry their drainage where it is fouled to a greater or less extent from the particular district to the main drain which would be provided for its outfall. I am perfectly satisfied, and I have never scarcely spoken to a practical man who did not agree with me, that as far as our district is concerned it is perfectly idle to talk about getting rid of the sewage by anything like irrigation. The land is not to be had, nor could it be in any way satisfactorily accomplished. The sewage is to be got rid of from hour to hour, and it would be enormous in volume, and I am satisfied that unless we have the means of getting rid of it altogether we shall never be in a satisfactory position. I am anxious to show what general powers must necessarily be given to the local authorities or the central board if this question is to be dealt with at all. Unless some such powers are given we should be utterly powerless. It appears to be absolutely necessary that a board should be established; whether it is to have the conservancy of rivers or not also is quite another question, but there must be a board established which would be able to carry out great works to which all parties would be called upon to contribute, or else we can do nothing.

2370. Supposing, as I think nobody can doubt, that river basins must be dealt with in the aggregate by conservancy boards, do you think that such a prospect affects your city administration in Manchester as to either making sewers or gasworks, or anything in the way of the disposal of sewage?—I do not think that it does, because we have adopted a certain practice, in which we still persevere. Until we know what is to be done as regards the sewage we still adhere to the opinion, upon which we have acted for years, that it is expedient to discountenance to the utmost extent possible the introduction of waterclosets in small tenements, and the still further fouling of the sewage; we have something like 36,000 ashpits in connexion with privies, and I suppose we may have perhaps 10,000 waterclosets throughout the whole of the city.

2371. When I was President of the Board of Health did you not bring in a bill for the purpose of taxing waterclosets?—We did do so, and you were kind enough to say that you would not oppose that bill, but we were opposed by the sanitary fanatics, and they induced the Committee to decline to give us that power. Instead of giving us power to tax the

first watercloset, they put in more stringent regulations that we should not charge anything for the first watercloset, and that we should be bound to supply them with water. That, however, has made no difference in our practice.

2372. You are still now after 10 or 12 years' experience advocates for the ashpit system?—Yes, for the privy and ashpit, when properly constructed, at any rate, and we are perhaps more strongly advocates of it now than we were 10 years ago.

2373. How far is it self-supporting by the sale of sewage?—It is not self-supporting by any means; we recover back one-half only of the expense probably that we incur in removing the nightsoil; but if we had no nightsoil to remove, the expense of removing the ashes would be in our opinion quite as great as the amount which we now spend, or rather as the deficiency which now exists in removing both, because we should still have to get rid of the ashes, and the difficulty would be increased enormously, because even now there is great difficulty in knowing what to do with the ashes; it would be a large expense and no return, and as Sir William Denison has been telling us at many of his meetings the great evil under which we, Manchester and other neighbouring towns, are suffering, is that we have too little water and too many ashes. Until we have determined what to do with the sewage it certainly is inexpedient to foul it more than we can possibly avoid.

2374. Have you any suggestion to make to the Commission relating to your byelaws with reference to streets and buildings?—I do not think that any alteration in the law as it now exists is desirable with reference to byelaws. I think it is much better that byelaws with regard to buildings and streets generally should, as now, be made with the approval of the Secretary of State; there are so many alterations required from time to time, that I think it would be exceedingly inconvenient if those byelaws were in any way introduced into an Act of Parliament. At the same time, I cannot myself see any reason why a byelaw as approved by the Secretary of State should not have the force of law.

2375. Do you approve of the code which now exists?—No; I neither approve of the code nor the powers given to make that code. I can give the Commission an illustration of what sort of local legislation is constantly required. Here is a bill which we have in Parliament this session; we have only adopted those building byelaws a short time ago, and when we adopted them we adopted them under the very same provision as exists in the Act of 1866, and we took the byelaws precisely as they had been approved and adopted by the local boards and authorities round Manchester; but we very soon found when we came to consider and look at those byelaws carefully with a view to possible litigation, that there were very many of those byelaws which were utterly unauthorized by the power under which they are avowedly made, though those byelaws had been approved by the Secretary of State. We consequently have had to introduce into our bill this session several clauses which in my opinion are absolutely necessary to enable us to carry out what is intended by those byelaws, but which the power itself to make the byelaws does not give. I can illustrate that by alluding to the power under which those byelaws are made. I can show in a moment what I mean. Referring to the 34th clause in the Local Government Act of 1858, we adopt in our Act the same clause without any alteration. And only a short time ago we adopted the byelaws which had been sanctioned for other places, and which include byelaws as to the size of rooms and various other matters of that kind. We were told that that byelaw could not be maintained, and when I came to look at the Act I felt satisfied that it could not. The 3d clause authorizes byelaws to be made "with respect to the "sufficiency of the space about buildings to secure the "free circulation of air and with respect to the ven-"tilation of buildings." We were told, and I believe rightly, that a byelaw fixing the size of rooms, or the number of cubic feet, was not authorized by that clause, and I doubt very much whether it is, and we have consequently been satisfied that if we could fix the height of rooms as sleeping or dwelling rooms we should effect the same object, and we have a clause in this Act enabling us to fix the height of any room. Then, again, as to what is to be considered a new building, and subject to the byelaws, it says: "For the "purposes of this Act the re-erecting of any building "pulled down to or below the ground floor," and so on, "shall be considered the erection of a new building." That of course must be construed literally; and we cannot interfere with any building which has not been taken down to the ground floor. We soon found builders in Manchester taking down their buildings piece by piece and rebuilding, and we have had cases where the whole structure has been rebuilt and not a brick of the old building left, but to which the byelaw would not apply. We have tried to meet that by the 35th clause in our bill, now before the House of Lords, which provides that "In case any person shall "make any addition to any building erected after "the passing of the Manchester Improvement Act, "1865," (which was the Act containing the power to make byelaws,) "or shall" (and these words were inserted by Lord Redesdale, which is only a proof of the carefulness with which he examines all bills), "for the purpose of evading the byelaws for the "time being in force in relation to buildings, take "down any part of any building, whether in an old "or a new street, with the intention of rebuilding "the same, then the same," shall be subject to the byelaw. Again a case was taken before the Court of Queen's Bench, who decided that a man was not contravening the byelaw who delivered his plan, and the moment he delivered his plan set to work to erect his buildings, as he was doing so at the risk of having his building pulled down. We have, therefore, inserted a clause which makes it obligatory on any person who is going to build to give us in fact 10 days' time to approve of the plans, and if we do not disapprove of them within those 10 days he may go on building subject to the byelaws, or if we give him notice within the 10 days that he must alter his plans, then he cannot go on doing so without satisfying the corporation. There are many other clauses in that bill. It shows the sort of legislation we are constantly requiring in order to meet the difficulties which in practice we experience, but the difficulties I have referred to we have met with in connexion with the byelaws. My strong opinion is that the byelaws are every year being more carefully considered by the Secretary of State, and I have no doubt now that the Secretary of State could without any difficulty establish a satisfactory code of byelaws, but increased powers must be given for the making of byelaws. The power ought to include everything which could be thought to be likely to be required, because you must go back to the power in order to ascertain whether your byelaw is authorized, but I think that byelaws which are approved of by the Secretary of State might very fairly be declared to have the force of law, and I do not think that anyone could reasonably complain if the power of taking your byelaws to the Court of Queen's Bench for the purpose of trying to show that some possible form had been omitted or that there was some technical objection that could be taken were withdrawn. If any objection could be shown to a byelaw it is quite certain that the Secretary of State would be quite willing to sanction an alteration, and the local authorities would be compelled to modify it, if it could be shown that any modification was necessary. I think it is very desirable that the power should continue as now in the hands of the Secretary of State.

2376. Have you any experience of the sanitary administration of rural districts?—No, I have not had much experience, but I can state very shortly what appears to me to be desirable. I am strongly of opinion that there ought to be by some means or other

. Heron, Esq.
7 June 1869.

power to impose upon some local authority the responsibility of carrying out the general sanitary Acts to the extent required in all districts throughout the country. As far as regards local districts that contain a considerable amount of population, subject of course to the power which the Secretary of State has of arranging the districts with reference to the powers that would have to be carried out, both as regards sewerage and water and other matters, it seems to me to be very desirable that there should be a local authority of a representative character in any such district where the population really would justify that arrangement, and that in addition to the elected representatives, because there would be a large amount of taxation necessarily involved in introducing and carrying out the Acts; it would be very desirable if a certain number of gentlemen, magistrates, who were connected or might be connected with the district locally or by property, were also on the board *ex officio*, but not quite in the way in which they are *ex officio* members of the board of guardians, but that a certain number should agree to become members of the local board, and undertake as far as it was necessary, in common with the elected representatives, to discharge their duties; there is no doubt that such *ex officio* representation would very much increase the efficiency, and probably give increased confidence to the working of the local board. Then in other districts, strictly rural districts, where it would appear to be impossible to elect a body of that character, but where it would still be necessary that sanitary provisions to a certain extent should be in operation and carried out, it appears to me that probably the most convenient authority to leave that part of the duty to would be the guardians, and on this ground, that there are guardians, I presume, in every district, and that their interference would be very rarely required in such a rural district as I am contemplating, and that the guardians could very easily, without much addition to their own peculiar functions, carry out to the extent required the sanitary Acts. In my opinion if there is only one house it seems just as necessary that there should be the same sanitary arrangements carried out with reference to that house as if there was a street, and if there was a street there should be the same sanitary arrangements carried out with reference to that street as if there were a number of streets collected together; the object is to prevent in the very early history of a town the bringing into existence those objectionable constructions and other matters which afterwards lead to so much difficulty in remedying them. Therefore it appears to me that it is just as necessary for a comparatively rural district that sanitary laws should be in operation, and that there should be some authority responsible for carrying them out, as in towns. To show the necessity of it in towns, I may mention what occurred quite recently in the neighbourhood of Manchester. A gentleman told me that he had been selling a large quantity of land for building, but that three or four builders of a low class of property who actually had agreed to buy his land had recently told him that they should decline to fulfil their contracts as they had made arrangements to buy land in an adjoining district where they were not to be bothered and annoyed by building byelaws.

2377. Have you any opinion as to the expediency of the ownership and management of both waterworks and gasworks being vested in the local authorities?—Yes; I have a very strong opinion that it is very desirable that in all cases where it is possible or practicable the ownership of the works, both water and gas, should be in the local authorities. For as far as water is concerned, it is obvious that they should have the power as well as the responsibility and the duty where it is practicable of supplying the inhabitants with water; and as regards gas where small towns in their early history undertake, which they would be obliged to do either by a company or by themselves, to form gasworks and to supply the inhabitants with gas, it is always found as the result of time that the gas business is a profitable business; the gas is supplied at a desirable price, because in fact the inhabitants regulate the price themselves to a great extent, and the profit which would otherwise go into the hands of the company, 10 per cent. or whatever it may be, which is very easily made if there is any population, can be expended for the benefit of the inhabitants generally. In Manchester we have the waterworks, and perhaps I may state that where there is a water supply obtainable from another corporation there is no reason why the local authority should either have the expense or trouble or responsibility of providing works of their own, and although our population is only about 380,000 we practically supply water to the whole district. I suppose we supply water to a district which will contain a population of 750,000 inhabitants, and we have expended already in our waterworks upwards of 1,800,000*l.* By that very bill which I have just handed to the chairman we have power to borrow 200,000*l.* in addition to the powers which we already possess, which are not yet exhausted, for the purposes of our waterworks. It seems as though the expense was interminable, but great as the expense is, the advantage to the district is far more than in proportion.

2378. Have you had occasion to borrow largely for other than waterworks?—We have borrowed for other works, and in connexion with that perhaps I may be allowed to state that in my opinion there is nothing which would encourage local authorities so much to carry out sanitary works as increased facilities for obtaining the money required. I believe that it would give extra inducements to local authorities to carry out works which might be suggested and recommended if they saw that there was a ready means of obtaining the money.

2379. Might not the facilities be too great?—No; in my opinion danger in that sense would scarcely exist at all, but the difficulties now of obtaining money are so great as to throw very great obstacles in the way of any local authority; a small local authority representing a small district cannot borrow money readily, if at all, under five per cent., and they are obliged to borrow subject to repayment at a very short period.

2380. What sort of period?—From five to seven years. It is very difficult to get people to lend for as long as seven years. We have had that difficulty in Manchester. We have borrowed from the Bank of England 750,000*l.* repayable in 20 years by equal annual instalments, we borrowed 100,000*l.* odd from the Public Works Loan Commissioners repayable in 20 years, and we have borrowed under the Act which was passed at the time of the cotton famine 150,000*l.* upon the terms authorized by that Act.

2381. What sort of additional facilities would you propose?—I think that the Public Works Loan Commissioners should be authorized to lend to local authorities for the purpose of carrying out any works which have been sanctioned if not required by the central authority the Secretary of State, repayable by equal annual instalments, those annual instalments, including the interest and a portion of the principal; it would be necessary to repay the whole amount by a sinking fund at the expiration of 20 or 30 or 50 years, whichever might be the time fixed, at a rate of interest certainly not exceeding four per cent., and that increased facilities should be given for carrying out any such powers. It was not satisfactory as it used to be carried out under the Loan Commissioners. They now, I believe, as a rule, do not under ordinary circumstances lend money under five per cent., and therefore they do not lend at all, because nobody would think of going to a public department to borrow money at five per cent., but formerly the practice, as I know from experience, was this: supposing we borrowed 100,000*l.*, it was payable in four instalments. I am speaking now of what actually occurred. Although the rate of interest agreed upon was 4*l.* per cent., we had a mortgage for the first instalment, which cost a considerable sum of money, at five per

cent.; we had a mortgage at five per cent. for the second instalment, and also a mortgage at five per cent. for the third, and another for the fourth, and then when we had received this amount agreed to be lent, and when we had been paying interest at five per cent., we had the four mortgages consolidated by another long deed, and the interest reduced to four per cent., and credit given to us for the excess of interest between four and five per cent. that we had paid in the meantime. That was the practice, but that it was an unnecessary practice was proved most abundantly by what took place at the time of the cotton famine. We borrowed 150,000*l.* at that time, and it was a very unsatisfactory financial operation, because we took that money with the understanding that we would to the extent that we might find practicable employ the operatives. The consequence was that we could not get a tender for our works except upon most unsatisfactory terms and a schedule of prices which under other circumstances would never have been heard of. The operatives to a very slight extent came for work; they came for a short time, but they soon tired out and left; but we were left with our contract, and the expense to us of a comparatively small contract was very large indeed. What, however, I was going to say was, that in borrowing that money through the interference of the committee over which Lord Derby presided, our expenses were enormously reduced, it was shillings instead of pounds we had to pay, and the red tapeism, as I call it, of the former arrangements all disappeared. We got our mortgage in the way in which any man of business would think was perfectly easy and practicable; we paid little or no expense for it, and we had no trouble.

2382. Do you think that you ought to have power to raise money from a Government office at a cheaper rate than you can get it in the market?—Yes, but it is not only the rate. As far as regards Manchester, of course we can borrow under very favourable terms. We have a debt which represents millions, and on that debt, although we have often to go into the market and borrow at unfavourable times, we do not really pay more than 4*l.* 1*s.* 6*d.* per cent. or something like that; we therefore can borrow money upon favourable terms. But even taking the case of Manchester, which has those means in its power, I still say that it would be the greatest possible advantage to us, and it would be a great encouragement to us even to carry out the necessary sanitary improvements, if we could borrow the money if only at the same rate of interest but upon the terms that would give us a lengthened period for the repayment of the amount in equal annual instalments. That is an arrangement which you cannot make with private lenders; you can only make that arrangement through the instrumentality of the Government, and if the money was lent at four per cent. it would of course be a profitable operation, and is I think one of the most justifiable ways of appropriating the monies.

2383. What is your opinion as to the amount of compensation to which local authorities are liable in various improvements?—As far as regards that we of course have to pay what is assessed, and I am sorry to say, as far as my opinion goes, experience shows that we must suffer for any property with which we in any way compulsorily interfere. The compensations which are extracted from local authorities are very large indeed. Supposing we are going to make a new street through old rubbishy property, the moment we look at it architects put their heads together, and the property goes up to an enormous extent in their estimation, and their opinion has to determine to a very large extent the price to be paid when you go to an arbitration or a jury. Then when we come to determine the amount which is to be paid for this property, although in strict law the arbitrators ought not to take into consideration the effect of the improvement in increasing the value of the property, practically they do it, and you cannot prevent it, because the owners often are able to show purchases made from time to time by parties who, relying upon the improvement being carried out, give extravagant prices. Then it is very difficult for the arbitrator to do otherwise than admit that what has been paid in the market is the value of the property, and I do not see how it is to be avoided. But in addition to this, whilst they make you pay an enormous price for the property, it is the practice to add for the probable value which would have been obtained if you had not interfered, varying from 10 to 15 or 20, or in Manchester about 25, per cent.; that is to say, after they have fixed the full value of the property they add 25 per cent. for what they call compulsory sale. As I have already explained that would not arise to the same extent in dealing with property under the Artisans and Labourers Dwellings Act, because there the principle is declared by the bill itself that you are to pay for the property as property in fact condemned, and practically as unfit for human habitation, and they cannot extort these large amounts from you.

2384. (*Earl of Ducie.*) You stated that you borrowed a large sum of money from the Bank of England for various improvements. What interest did you pay to the Bank of England?—We paid four per cent. We did borrow temporarily a certain sum at 3*l.* 10*s.* per cent., but that was only for a short period of years; and it was clearly understood that the amount, which was 150,000*l.*, was not then to be repaid, but that we were to make arrangements as to the mode and time for the repayment. Unfortunately the rate of interest had gone up very much at that particular period, and the Bank of England screwed us most awfully. They made us pay five per cent., and they would not let us have a shorter term than five years for the repayment of that 150,000*l.*; but for a large sum that we borrowed we paid four per cent.

2385. You stated, did you not, that the infant mortality at Manchester is equal to one-half of the whole mortality?—Yes, I stated that the mortality under five years is equal to one-half the whole mortality, and the mortality under one year is one-half of that.

2386. Can you tell the Commision whether the children who are under the care of the guardians in the workhouses or in the district schools are liable to a similar mortality?—I really cannot, but there is very little doubt that they would not be liable to the same amount of mortality, because I am quite sure that under the care of the guardians as well as under the care of the managers of the industrial and ragged schools, they would be much better looked after and much better cared for.

2387. In all probability then the ordinary conditions of infant mortality in Manchester are reversed?—No doubt. At any rate they are not so unfavourably situated; I am satisfied that would appear from the statements with reference to the whole mortality of Manchester.

2388. (*Mr. Hibbert.*) Is there any difference in the rate of mortality amongst the infants in the different districts of Manchester?—There is no doubt about it.

2389. That is to say they are inhabited by a different class of the population?—No doubt; although I am not able to state the exact details, I am satisfied that this very high rate of mortality arises in those districts which I have referred to as being specially the unhealthy districts of the town.

2390. I want to know whether this high rate of mortality amongst the children principally exists in those districts which are occupied by persons working in factories, for instance?—I am not able to speak positively, but I should say that no doubt that would be found to be the case. I have given information to the Commission rather as it has been put before me by the officer of health.

2391. Do you know whether there is much overcrowding in the districts of Manchester?—Yes, there is no doubt that there is very considerable overcrowding in some of the districts, and that is one of the great difficulties with which we have to contend. The overcrowding takes place chiefly in those districts

J. Heron, Esq.
7 June 1869.

which I have said are the most unhealthy, where the Irish population reside to a great extent.

2392. Do you think that you require greater power with respect to that evil?—Whether there is any necessity for greater power I doubt, because the powers which already exist seem to be very great, because you may interfere with overcrowding almost under any circumstances. I forget when the Act was passed, but we formerly had difficulties in interfering where they were not lodging houses, but there is an Act I know in force now where the definition of lodging houses has either been very largely extended or does not exist, and we have now power to regulate the number of people that are to be allowed to dwell in the houses although they may not be common lodging houses. There was formerly this difficulty, people said, We are not lodgers, we are simply friends who live together. In those cases no doubt they were always members of different families, but it is almost impossible to limit the overcrowding where they are members of the same family, in that case you cannot interfere.

2393. Have you ever put the Act into operation?—Yes, there is no doubt that it is in operation continually. The carrying out of that Act has been imposed upon the chief constable in connexion with the business of the police, who make a regular inspection, and whenever they find houses unduly crowded they enforce the regulations which have been made, and which have been approved of by the Secretary of State, as to the number which shall be allowed.

2394. Do you know whether this great rate of mortality is higher on the banks of the rivers which run through Manchester than in other parts of the town?—No, I do not think it is. I think that there are comparatively few houses now on the banks of the rivers, they have been gradually removed, so that I believe that there is no excessive mortality that can be attributable at all to the effect of the rivers.

2395. Generally are they low-lying districts where this mortality exists?—I do not think that that is a special characteristic of those unhealthy districts. I think it is the reasons which I have already referred to that make them so unhealthy, and not their physical position.

2396. You have stated that in cases of violent diarrhœa or an epidemic of that nature you think that the guardians should have authority without applying to the Poor Law Board to supply the necessary medicine, would not you go further than that and say that in giving medicine to those persons it should not make them paupers?—Yes, certainly.

2397. I presume when medicine was given by the guardians in the case you have alluded to, all the persons receiving it would become paupers for the year?—I really am not prepared to say whether that would be the effect. If it would be the effect it seems to me most unjust and very desirable that it should be removed, because in the case that I am supposing the proposition was that there should be a depôt in those districts where the diarrhœa was said to be most prevalent where anybody that chose, no matter what their condition, could have gone and got the diarrhœa medicine; they would not be so fond of it to take it unless they wanted it, and if they wanted it it was most desirable in whatever condition of life they were that they should get cured.

2398. You would not look upon it as medical relief?—Certainly not so as to pauperize the parties.

2399. You said that you thought it would be desirable that byelaws should have the force of law; do you think that a plan similar to that adopted by the Poor Law Board, in cases where they make a general order which has the force of law, might be adopted by the central authority?—Whatever objections might possibly be suggested would be far stronger in reference to orders of such an important character as are often made by the Poor Law Board than they could be as against a matter of detail of the kind that we are talking about. Certainly it might be left to the Secretary of State to frame orders of that kind. I cannot see how anybody can object to those orders when you have his sanction having the force of law.

2400. You are aware, are you not, that the general orders now made by the Poor Law Board are laid upon the table of the House of Commons?—Yes, I believe so.

2401. Would you recommend a similar course with respect to byelaws which are to have the force of law?—If it were thought desirable I can see no possible objection to it, but it does not appear to me to be even necessary.

2402. If you did that and gave power to the Secretary of State to make byelaws which should have the force of law, would not it be possible to place all towns under a general code?—No; I think that the necessity of making alterations would so often arise, that it seems to me that no object would be gained by putting them under a general code. The Secretary of State no doubt in practice would insure as far as he could, uniformity. Having adopted a code, he would not allow that code to be varied from, unless some sufficient reason could be shown, arising probably out of the circumstances of the locality, and in that case he would sanction a modification; and it seems to me very desirable that that power should be in the hands of the Secretary of State.

2403. Is it not the case that those continued applications to Parliament for improvement bills by different towns are a source of considerable expense to those towns?—No question about it. There is great expense connected with it; therefore, I think you may rely upon this, that unless there is a necessity local authorities will not incur that expense; they want no interference to prevent unnecessary applications.

2404. Would not it be possible with respect to towns like Manchester and Liverpool or other towns, that instead of coming to Parliament for a special bill, you might go to the Home Secretary and obtain powers under byelaws, and that the towns to which those byelaws would refer might be put in a list just as unions are placed in a list in a general order issued by the Poor Law Board?—It strikes me that that would be a very objectionable power, and I do not think that it would be likely to be adopted. It would be giving to the Secretary of State upon matters which had never been considered in any way by Parliament the power in fact of passing Acts of Parliament. The general law would include most things, and the power to make byelaws of course is given with regard to certain matters where it is felt that that power is necessary in order to carry out the working of the Acts of Parliament, but there are various other matters which Parliament alone ought to be able to deal with. It would be distinct and new legislation, and I think that it could hardly be put into the hands of the Secretary of State in any way. The power to make provisional orders is as I understand it limited simply to giving power for the compulsory purchase of property; that is a very useful power no doubt, and it is one that I am satisfied with, and should be glad enough to take advantage of if we were going to Parliament simply for the authority to carry out an improvement; but that never is the case, and I am afraid never will be. We always want other powers which we could not obtain by means of a provisional order, and in that case one expense includes the whole.

2405. Do I rightly understand you to say that you do not consider it necessary to give any increased inspection to the central authority?—No; I would not give any increased power in that direction. I do not express any opinion as to the number of inspectors that might be required to give all information necessary for the Secretary of State, but I would certainly give no increased power to the inspectors to interfere with the local authorities, whether in large or small towns.

2406. You do not think it necessary that the inspectors should be travelling about the country, but rather that they should go to visit places from which

they receive complaints?—Yes; I certainly should think that that was quite sufficient; either where they received complaints or where, as is now the case, the death rate or other circumstances of a casual or temporary character seem to call for some special interference.

2407. In the case of towns or districts that are under the Local Government Act, would you recommend that any intermediate authority should be placed between them and the central authority?—Certainly not; I cannot conceive myself of anything that, in my opinion, would be so unworkable and so unsatisfactory, as that intermediate authority consisting of county justices or a county committee. It would be most undesirable and most objectionable to establish any such intermediate authority as has been described between the local authority, either now existing or to be created, and the central authority by means of a county board as I think it has been called. It was said that it would be a useful buffer, but my opinion is, that instead of being a buffer it would be an obstruction, and it would lead to constant and very inconvenient collisions. In my opinion any interference on the part of county justices with the local authorities, instead of doing good, would rather tend to create difficulty and opposition on the part of the local authority. I think that the central authority alone ought to have that power to interfere, or some high Government functionary, with the responsibility which attaches to his position; and the knowledge that anything which is done can be the subject of inquiry before Parliament.

2408. Supposing that a local authority refused to carry out works which were recommended by the Secretary of State, do you think it desirable to leave the law as it at present exists?—Certainly not. I have already stated that I would give the most complete power to the Secretary of State to enforce upon the local authority through the magistrates the compliance with any order that he might make, and I would give to the magistrates in those cases power to impose continuing penalties upon the authority that failed to do its duty, leaving the authority to arrange, by negotiation with the Secretary of State or his officers, whether the works are to be carried out in the precise manner that he might prescribe, or in any other manner, which no doubt the Secretary of State would be glad to modify if they could satisfy him that the object in view would be accomplished as well in any other way. In the first instance my impression was that the application would be for a mandamus to the Court of Queen's Bench, but the more I think about it the more reasonable it appears to me that there should be given to the justices a summary and ready means of imposing a penalty upon a district that failed to comply with the order of the Secretary of State. That would not be an interference such as I object to on the part of the county justices; it would be simply making them ministerially assist in carrying out effectively that which was the intention of the power given to the Secretary of State.

2409. Do you mean the justices in petty sessions or quarter sessions?—In petty sessions, certainly not the quarter sessions; that would lead to very inconvenient and long delay. I should give power to the magistrates in petty sessions to say to the district, "We impose a penalty of 20*l.* and 5*l.* a day for every day that you fail to carry out the works." But in those cases there would really be a kind of understanding that the penalty would never be asked for if the duty which was imposed upon the authority was carried out.

2410. Supposing that the general laws are codified as is proposed, would you make them applicable to all places, or would you recommend that one code should apply to populous districts and another code to rural districts?—I speak with very great diffidence upon this point, and it is necessary that I should have a very perfect knowledge of all the clauses in the Act of Parliament to give a very satisfactory opinion; but as far as I can see, I really do not see what inconvenience or difficulty there would be in putting any local authority in possession of all powers relating to sanitary matters, whether they were really representing a large or a small or a thoroughly agricultural district. The powers are only carried out to the extent that circumstances require, and the circumstances in rural districts are constantly changing; and when a necessity to carry out any power did arise, why should not the local board be in possession of the same powers as are given to any other locality? If any of the powers were obligatory upon the local board without reference to the circumstances, then it might be inconvenient; but as far as my knowledge of those Acts of Parliament enables me to speak, I think the clauses merely authorize interference when the circumstances referred to in any clause seem to call for it; therefore I do not see why there should be any distinction.

2411. I presume you are aware that under the Local Government Act it was allowed to be adopted or not as places saw fit?—Yes.

2412. Would you leave the law in the same state?—No, certainly not. It is very difficult to suggest how it is to be accomplished, but it seems to me that the duty and responsibility of carrying out sanitary provisions ought to be in some way imposed upon a local authority in all parts of the country, and that it ought not to be left to either the inhabitants or anybody else to say whether they really will or will not have such provisions in operation.

2413. Would not it be possible to have two codes, one to apply to populous districts and another to apply to rural districts?—I think that my previous answer shows that, as far as I am informed, I do not see what is the object or advantage of having two codes; I believe the honourable member perhaps means that it might alarm the district if they saw a great thick book and were told that all those powers were in force within the district, but inasmuch as they would be easily informed that they were only powers to be exercised if required, I do not see what objection they could reasonably have. Take for instance smoke, you would hardly know what code to put smoke in. In a thoroughly agricultural district it would seem absurd to have a provision about black smoke, but you may have works of some kind established in that district which you might find the greatest possible advantage to be able to deal with, and to be able to stop anybody who might come and pollute the air of even a thoroughly agricultural district, and many other provisions might be referred to in the same way. With regard to the structure of houses, why should not they apply to rural districts the provision of necessary conveniences just the same as in towns? and with regard to the provisions of water or sewerage, even in an agricultural district, you cannot tell how soon sewering might become a matter of importance, and the powers ought to be there to be exercised whenever the necessity happened to arise.

2414. I understand you to mean that you would have the same powers given to the authorities whether they were the authorities of rural districts or of towns under the Local Government Act or under municipal corporations?—That is my impression with the information which I now possess; of course in consolidating the Acts of Parliament it would very soon be seen whether there would be any portion of the provisions that should be left to be brought in by some other arrangements and not immediately put into force, but I do not myself see that that necessity would arise.

2415. I understand you to say that you would utilize the boards of guardians in rural districts as the health authorities?—Of course I gave that opinion with great diffidence; but it seemed to me that it was almost the only authority that you could refer to that would exist in every district. Certainly the surveyors of highways do not appear to have so much to do with sanitary matters as the guardians, and I am assuming that the guardians would only really be called into action in such districts as were so com-

pletely rural and where the population was so very limited that it would not be found either necessary or desirable or practicable to have an elective local board.

2416. You are aware that the vestries of parishes are the sewer authorities of parishes, and the surveyors of highways are the authorities for highways, and the guardians are the nuisance authorities; would you consolidate all those in one body?—Undoubtedly. I certainly would have only one authority. There is only one matter that it seems might possibly be left and necessarily left to the guardians, and which they would have to carry out, and that is the Diseases Prevention Act, which only comes into operation under certain extraordinary circumstances; but I would most assuredly carry out as far as possible what really exists at the present moment in Manchester, and I am of opinion that there should be only one authority to deal with all questions relating to the public interest. We have only one authority in Manchester, and I think it is very desirable that that state of things should exist wherever a local authority is brought into existence.

2417. (*Lieut.-Col. Ewart.*) Have you met with any cases in your experience in which it has become desirable to annex an outlying district to the administrative area?—I can hardly say that I have met with such cases. No doubt such a district might exist, and some discussions have from time to time taken place as to the desirability of districts immediately around us being included within the area of the corporation of Manchester. Some districts have felt rather desirous to be included; but the corporation have not entertained such suggestions very favourably. We have never taken any steps for the purpose of enlarging our municipal boundaries, but I can very well believe that cases would very frequently arise where it would be most desirable, with the view of simplifying and more effectually carrying out the powers, that the district of an existing authority should be very considerably extended, both with reference to the supply of water and to drainage, and many other matters.

2418. As it now stands I believe that can only be done by agreement on both sides?—I believe that is so. The Secretary of State is to be put in motion by the district, and certain steps gone through in order to obtain the consent, I think it is, of a majority of the ratepayers. I am not quite sure what it is, but I think it is very desirable, and it would be almost a necessary part of the scheme which I have had in my own mind, that if there was power to impose upon a district a local authority, there should also be power in the Secretary of State to determine what the area and the boundary of that district should be, because it is quite clear that that area would be determined as the result of very many and very important considerations, and the local authorities would have to be summarily dealt with, no doubt, or else you would probably fail in accomplishing much good.

2419. Take a large town where a suburb grows up, what would you say in that case?—Or even a small town, where there is a suburb having a local authority, it would occur very often in districts which are more populous than their surroundings, that, for the purpose of general legislation and the carrying out of general sanitary provisions, it would be most desirable that the power should exist and be exercised of including within such areas the surrounding districts.

2420. What system of inspection have you in Manchester for health purposes?—Our system of course depends upon the nature of the duties which have to be performed. We have a very large number of inspectors having to discharge different duties. For instance, we have four or six inspectors who are solely occupied in looking after the general nuisances which arise within the town. We have certain inspectors who are appointed to go round to see that the privies and ashpits are not in an unsatisfactory or uncleanly condition, and partly with the object of giving notice to the authorities who are responsible for the removal of the nuisance themselves. When any privy is found to be inconveniently full it has to be immediately emptied; and we have also inspection of weights and measures, a separate department, and we have also inspectors of lodging houses and other houses to prevent overcrowding; that is in fact under the chief constable, so that there are different inspectors for almost every branch of duty which devolves upon the local authorities, and in Manchester from the size of the place they are necessarily very numerous.

2421. What classes of persons do you employ as inspectors?—We have an intelligent sort of men, but not at a high salary. There is a superintendent of course in every department, who has a tolerably good salary, but the rest of the men I should think receive (I do not exactly know their wages) from 25*s.* to 30*s.* a week. They are paid somewhat in the same way that you would pay inspectors or serjeants of the police force.

2422. Do you use your police force for the purposes of inspection in connexion with health?—It is part of their general duty to inform us of all nuisances which they meet with in the course of their rounds, and the fact is that quite as many cases are brought under the notice of committees of the council through the instrumentality of the police, indeed I may say more than are brought under their notice through the instrumentality of the special inspectors. We make use of the police to the extent that we can without interfering with their duties in exercising a general supervision with regard to matters of that kind.

2423. Does your experience lead you to think that, as a general rule, it is a good plan to use the police for those purposes?—Yes, where it is simply a matter which is obvious to them and seen in the discharge of their duties. For instance, I have felt that it would be a great advantage if the police were instructed to report every black chimney that they see (which has never been done yet), because they are going about the town continually, and they would be more likely to see them, for they only smoke for short periods, and a chimney might be smoking very often without being seen by the inspectors, who go from place to place in their rounds But I think it would be very undesirable, and we always object to the police being allowed, to interfere in any way which would bring them into collision with the inhabitants. Their duty would rather be that of reporting any offence which they see committed, and then leaving the party to be dealt with by the authorities at the town hall, so as not to mix them up unnecessarily with the inhabitants.

2424. Have you any organized system of inspection when new buildings are completed before they are occupied?—Yes, that is a part of the byelaws, and it is carried out. I do not mean to say that it is always carried out effectively, because we do find that in spite of the byelaws parties do take possession of houses before the house has been inspected; but as far as we can it is the object of the corporation to inspect all houses, and to see that the plans which they have previously submitted and got approved of have been carried out fairly with reference to those byelaws. I am not sure whether this power exists now under the general law as to a continuing penalty. We found that we had not got it under our Act, and therefore one of the clauses of the bill which we have in Parliament this year is to impose not only the penalty of 5*l.*, which is given by the general Act, but also a continuing penalty per day, because the only alternative beyond the 5*l.* penalty formerly was pulling down the house, which was a very undesirable remedy; so that it is very important, in order to carry out byelaws that there should be the power really to compel the owner to do what is required by making him subject to a continuing penalty if he neglects his duty.

2425. (*Sir Thomas Watson.*) You have expressed your objection to the use of waterclosets in Manchester; has there been any experience of the earth closet or the earth latrine there?—I do not think that we

have any experience in Manchester of what are strictly called earth closets. The fact is that the arrangement which we try to carry out is to deodorise to the extent practicable by means of the ashes which necessarily are met with in every dwelling, and by an improved construction of ashpits. There is a grid, as they call it, to allow the small ashes to pass into the ashpit, and in that way also to have them cast on the fœcal matter, and it is generally said, and I certainly have been in privies and ashpits which have been constructed upon a good principle where there has not been anything like the smell which, I am sorry to say, I certainly often experience in waterclosets in hotels in London.

2426. (*Dr. Acland.*) You have a health officer, have you not?—Yes, we have Mr. Leigh. He is a medical man, and he has for the last 25 years been devoting a very large amount of attention to sanitary matters; in fact, I may say so much so, that the Registrar General has in one or two instances, published in the reports which he laid before Parliament the reports which have been made of Manchester as to sanitary matters by Mr. Leigh. That was before he was appointed our officer of health.

2427. What are the duties which you would assign to him?—There is no attempt to define the duties which are assigned to the health officer; he is left very much to do what he may think desirable with a view to improving the sanitary condition of the city. At the same time we have a health committee, and one of the most important matters which they have been directing their attention to through Mr. Leigh has been the dealing with property of an unsatisfactory character, and where disease was constantly arising to a very undesirable extent, and the corporation are endeavouring to carry out (of course there is a little difficulty in introducing any change of system) to a very considerable extent the provisions of the Artizans and Labourers' Dwellings Act, in order to get property of a very bad character destroyed altogether, and other property improved. That is one of the duties that they have attempted. What perhaps is pressing upon the officer of health at the present time more than any other is dealing with privies and ashpits with a view to improving and getting rid as far as possible of the objections which may perhaps be necessarily incidental more or less to that system. Perhaps I may be allowed to say that we do not allege that privies and ashpits are unobjectionable, but we do say, and that is what we have always said and continued to say, that until a mode of disposing of and dealing with sewage has been in some way satisfactorily determined, we say, keep out of your sewers as much as possible the fœcal matter which in itself renders them polluted.

2428. Then his duties are not so much those of an inspector as of adviser to the board?—But necessarily involving a very large amount of inspection, because he never brings before the health committee any case except where he has himself inspected, and he is always able to report upon the extent and kind of interference which he thinks desirable; so that his time is occupied to a very large extent in inspection, in fact I may say mainly so.

2429. Is he responsible for making analyses of any kind for you?—He is quite competent and would do so, no doubt, and I believe it is understood that that to the extent which may be necessary is part of his duty. He has a laboratory, I believe, with all the necessary requirements belonging to the corporation, and is quite able to do any duties of that kind which may at any time be assigned to him, and for many years Mr. Leigh has been the consulting chemist of the gas committee.

2430. Are we to understand that the corporation provides him with a laboratory?—Yes, and the Council would provide him with anything which he might think or say was necessary, but I believe he has got it already, being required in connexion with the duties which he has long performed for the gas committee.

2431. The corporation or the local board, I presume, would consult him as to placing anything in that laboratory which they thought desirable?—No doubt.

2432. Does he make health returns for you?—Yes, every fortnight at every meeting of the health committee he makes a return of the deaths which have taken place in all the different districts of the city, that is to say, the districts as they are divided for the purpose of those returns by the Registrar General.

2433. Are those returns returns of sickness as well as of deaths?—No; he does not, I think, make any return of the amount of sickness, nor am I aware that he has attempted in any way to obtain such returns. There is no doubt about it that there would be very considerable difficulty in obtaining them at all. There is a certain amount of jealousy, and there would be a certain amount of objection on the part of medical gentlemen to make those returns, because it is difficult to say where they were to begin and where they were to end. Mr. Leigh has made application, and I believe they have carried it out to a large extent, to medical officers of boards of guardians and to others to inform him when cases of fever or any other dangerous disorder arise, in order that he might inspect the property and take all the steps necessary for disinfection or the removal of the patient, or anything else that might appear to be desirable. They give him that information, but I do not think that beyond that he has attempted to get any returns of sickness.

2434. But he is in constant relation with the poor law medical officers, is he not?—Yes, he gets information from them constantly.

2435. So that he really knows if there are any places infected with disease?—Yes, and he reports to the committee. He takes his own steps, and he has a sort of general authority to do with reference to disinfection what he may think necessary, but to that extent he gets information.

2436. Is your town divided into districts for the purposes of nursing?—I do not think so. I am not aware of it. There was one only attempt, but I do not think it lived long.

2437. It was attempted, was it not, to divide the city into sanitary districts for that purpose?—Yes, but I believe it has not been carried out.

2438. Is that done in Liverpool, do you know?—I think not.

2439. Did I understand you that the town was divided into districts for any purposes?—Yes, of course it is divided in many ways. We have our wards, for instance, for municipal purposes; we have our townships which I have already referred to; but I believe that the health districts, that is to say, for the pupose of returns to the Registrar General, do not correspond either with the wards or with the townships. These are districts which the Registrar General or those under him have themselves arranged, and which possibly might be improved. I think our officer of health has had some correspondence with the Registrar General upon the subject.

2440. Are those districts not conterminous with those of the Poor Law Board?—No, not conterminous with the districts of the Poor Law Board, for the township of Manchester is a union of itself. Cheetham is in the union of Prestwich. Chorlton, Hulme, and Ardwick are in the union of Chorlton-upon-Medlock, and I do not know in what union Beswick is.

2441. When you referred to the Acts just now did you include the Salford Sanitary Acts?—No; Salford is a distinct corporation on the other side of the river; but so far as regards the general carrying out of the law, Salford is very much in the same condition as Manchester. I do not think that there is any authority in Salford excepting the council.

2442. Is not your hospital at Chorlton under the control of the Poor Law Board?—Yes, entirely; that is an hospital in connexion with the Chorlton-upon-Medlock union.

2443. That is one virtually of your fever hospitals, is it not?—I believe it is, but the Chorlton hospital is really three or four miles out of Manchester; it has

Heron, Esq.
June 1869.

been felt that that distance is somewhat inconvenient, but still it is used as a fever hospital, I believe.

2444. The object of some of these questions is to ascertain from you the relation between your council as a sanitary authority and the Poor Law Board as a sanitary authority; is there any communication between the two authorities?—As far as regards the Poor Law Board, we really have no connexion with them in any way whatever, nor have they as far as I am aware any power whatever to interfere with us. The guardians alone are in communication with the Poor Law Board, and what may be the extent of their powers I am not exactly prepared to say, but practically as far as I know there is very rarely if ever any interference on the part of the poor law authorities within the city of Manchester.

2445. You referred to the Diseases Prevention Act; in case that is put in operation by the Privy Council what happens?—That I presume would have to be as I have already suggested carried out by the guardians, especially as that power is given to the guardians and it is not given to any other authority. With reference to a great number of other powers of which we have been speaking, the local authority is various, and in fact the corporation may very often interfere, and I daresay the guardians also in many cases might, if the necessity arose, interfere also, with regard to nuisances; but whatever their powers may be, practically they are not in any way exercised, or very rarely indeed. I am scarcely aware of a case within the city of Manchester. The guardians leave to the corporation the carrying out of all such provisions except as regards the Diseases Prevention Act, and if circumstances required some extraordinary steps to be taken, then I presume the guardians, and the guardians only, would be able to interfere.

2446. The guardians only would be able to carry out the provisions of the Diseases Prevention Act?—I believe so.

2447. But notwithstanding that, if the guardians were in case of cholera epidemic to take charge of the population, as morally and virtually they are bound to do, it is doubtful whether they would not have their accounts stopped by the Poor Law Board?—I fancy so unless they had got consent, and I do not know to what extent the Poor Law Board could give them that consent. In the case of the Diseases Prevention Act the Privy Council must issue an order, and unless the Privy Council issued an order the guardians would be liable to be surcharged; and in the case that I referred to, although the guardians only did what they felt was absolutely necessary, they said they would run all risks of being surcharged, and they made arrangements to the extent that appeared desirable for the supply of medicine; and they did so though we did not succeed in getting the order of the Privy Council.

2448. But you are the sewer authority, are you not?—Yes, we are, but we have our own powers, so that I have hardly ever had to refer to what the special powers given by the Sewers Act may be.

2449. Then under the Sanitary Act you have power either to provide hospitals or to make use of any existing hospitals for whatever purposes you think fit?—I rather think that that power does exist, but I think it is only temporary. That Act certainly gives the power, but hitherto I have had no occasion to refer to what those powers would be. We have never attempted in any way to exercise them or carry them out.

2450. With reference to your middens or ashpits, do you happen to know what is the experience of Stockport?—I really do not.

2451. I suppose that the Lancashire towns generally were managed in the same way as Manchester in that respect?—I believe nearly all except some newly created towns where they thought they were to begin in a state of perfection, and they find that they have turned trout streams into very disagreeable polluted streams; or else, generally speaking, in all the old towns in our neighbourhood I think it will be found, as in Manchester, that privies and ashpits are the rule, and waterclosets the exception. Perhaps I might be allowed to interject one observation, for it is rather an important one. In Manchester, under our Act of 1844, a privy and ashpit in such a situation as satisfies the corporation is required to every house. The corporation have required the existence of a yard behind each house in which the privy and ashpit will be placed. The consequence of that legislation has been that in Manchester, since 1844, the building of back to back houses, which is one of the most crying nuisances that can be imagined, has been illegal. The clauses of the Act have necessitated behind each house a yard, and then between the yards of those cottages and the cottages bordering into the other street there is necessarily a passage, so that the nuisances created by and the evils arising from back to back houses and cottages being erected have not been allowed to exist in Manchester since 1844.

2452. May we gather this from your evidence as well as from other circumstances, that it is your opinion that that system would be wholly inoperative unless you had a complete system of inspection?—It involves certainly a certain amount of inspection necessarily; and it certainly would be desirable that in places such as Manchester the duties should be imposed upon the local authorities of emptying those places, and keeping them as far as emptying is concerned in a satisfactory condition.

2453. Your system of inspection is that of taking upon the local authority the responsibility off the shoulders of the landlord or occupier?—Yes, as far as the emptying of privies and ashpits is concerned.

2454. Then the local authority are responsible for any fault or nuisance of that kind which we might find in the town?—Yes, any nuisance arising from the non-emptying of privies; because I must guard myself against becoming responsible for the filth which is to be met with, because I believe in many districts it is found by experience to be the fact, that if you emptied and washed the privies every 24 hours, they would be unfit for anybody to enter in less than half that time afterwards. You cannot alter the character of the people, they seem in some districts as though they preferred to make foul and disgusting that which is before them, rather than to take the trouble to do that which is intended and suggested by the arrangement which is carried out.

2455. Is there any resistance to inspection?—No resistance whatever. So far from there being any resistance they are rather anxious to encourage it, and very thankful for the inspection which is carried out.

2456. (*Mr. Bircham.*) You propose to us one code for town and country, and you repudiate the idea of any inspection over bodies that are under the Local Government Act; would you leave the country authority without anything between them and the central authority?—Yes, I would, certainly. I think the same reasons that would justify a town in objecting to the right of the local magistrates to interfere would justify the country districts.

2457. Have you had any experience as to the necessity for bringing pressure to bear upon boards of guardians in rural districts to bring about the performance of their duty?—No, I have had no experience whatever, but I can very well understand that it would be an advantage, and I think I should be giving very unsatisfactory evidence if I did not add that in my opinion there ought to be vested in some authority, the right to interfere wherever boards of guardians or the local authorities are neglecting their duty.

2458. Would you prefer, instead of such action as the Secretary of State is empowered to take under the 49th section of the Act of 1866, that he should only have power to inflict a penalty?—No, I would not withdraw any powers that have been given to the Secretary of State by the 49th clause, but I would give additional powers such as I have explained, so as to do away with the necessity, except some most extra-

ordinary case occurred, which I can hardly believe ever would happen, of his undertaking upon his officer's responsibility the carrying out of works.

2459. There might be a difficulty, might there not, in levying a penalty upon a district formed for health and nuisance purposes?—It is possible, but I do not imagine that there would be any difficulty in practice. In every Act of Parliament there are constantly enacted penalties to be imposed in case of neglect of duty. I suppose there is such a thing as sequestration, but in fact I believe that the powers if they were given would very rarely have to be exercised, except to a certain extent.

2460. You have expressed an opinion that there might be the same code in country and in town districts, and it seems proper and necessary that in towns the houses should have a right of communication with the sewers without exception, but would not it be found in rural districts very desirable that the local authority should have the power of making drains for the escape of pure water with which no sewage should communicate?—It is quite possible, but I can hardly imagine that any district could be satisfactorily supplied with water that had to be conveyed in that way.

2461. In rural districts it would not infrequently be desirable to drain off water as detrimental to health, to lower the water table,—and in towns you give a universal right to buildings to connect with the sewers for their sewerage, and you would suggest one law for the town and country; would not it be desirable that in the country districts there should be power to have a water drainage with which no sewerage should interfere?—I think it might very possibly be desirable, but I do not anticipate that that would create any difficulty. I am not aware that power is absolutely given in towns to any house to communicate with the sewers without the consent of the local authority. A street is sewered and paved under the ordinary powers at the expense of the owners of the land on each side of the street, and then it is quite clear that the owners or the occupiers of all the houses must necessarily have a right to drain into the sewer. It has been made for their benefit, and they have paid for it; but where it is a public sewer made at the expense of the inhabitants of the township, then, in Manchester at any rate, the right of the tenants does not arise. They can only drain into such sewer with the consent of the authorities. If I understand the question it is assuming that there would be a duplicate system of sewering necessary. You would require to have a sewer for the purpose of carrying away the ordinary drainage of the houses, and you would require another set of sewers for the purpose of conveying pure water for some purpose or other which I cannot quite understand.

2462. Although in rural districts it might not be generally necessary to construct sewers, might it not in many such cases be desirable to get rid of surplus water by pure water drains?—I have no experience at all of that.

2463. With regard to new buildings, could you expect to put the country under the same law, or would it be necessary to put it under the same law as towns?—No, certainly not, and there you see the case which I put is clearly and distinctly met. The local authority would have full power to make byelaws, but it is scarcely possible to suppose that the local authority or the guardians in every rural district could make byelaws to regulate buildings which may become by change of circumstances very necessary. The power should exist, but it would lie dormant until the necessity arose. I certainly would not by legislation make the laws regarding private buildings apply to rural as well as town districts; certainly not.

2464. But would you not propose that there should be legislation applicable to the country, so as to have the houses built properly for human habitation, and to suppress those that are not?—Yes, certainly, whether there is one or a thousand houses I think the necessity for some legislation would arise.

2465. (*Mr. Richards.*) Do you wish the Commission to understand that in rural districts you would have the plans approved by the authority before the house is commenced?—No, I do not think it would be necessary to go to that extent. I do not think there would be any hardship, and if there were there would be the power which could be enforced if it were required; but then, again, it would not be enforced unless you made byelaws. I do not assume that byelaws would be made except in districts where the necessity of applying those regulations would arise.

J. Heron, Esq.
7 June 1869.

2466. With respect to the 49th section of the Act of 1866, would you have the Commission to understand that the Secretary of State should first approve of a plan before he called compulsorily upon the authorities to carry out any work?—Certainly.

2466*a*. Then the operation would be this: complaint would be made to the Secretary of State, and he would send an officer to see what works were necessary, and have proper plans prepared?—Yes, the operation would be pretty much as you say, but I assume that in all cases the Secretary of State, when there is complaint, would communicate with the local authority, and they would have the opportunity of stating their case, and if they say that they will do nothing to meet the objection, then the Secretary of State would send down his inspector. This inspector would also have an opportunity of seeing the local authority, and would have to determine what really was necessary, and what he could recommend to the Secretary of State as necessary to get rid of the objection of which complaint had been made. Then if the local authority really will not do its duty and will not consent to anything, the order which would be made by the Secretary of State would be binding upon them, and they would be subject to penalties if they did not carry it out. It would be their fault if it was an unsatisfactory plan, because they would have an opportunity which they neglect to take of arranging with the Secretary of State himself or his officer what plan they would prefer; but it would be necessary that there should be a plan put before the local authority.

2467. You consider that that would be a preferable plan to the Secretary of State ordering the works to be carried out?—Yes, certainly. I conceive that the latter course would be attended with enormous difficulty, and certainly it was not contemplated by those who had something to do with that clause.

2468. Is every part of Manchester now sewered upon any principle?—It is sewered upon a principle and we believe we are about the best sewered town in England. I do not believe that there is a street or court in which there is not a most thoroughly effective system of sewering and draining. I believe that that is generally admitted throughout the whole town. You may go into the narrowest and most confined and worst courts and passages, but you will find that there is a complete system of sewering. Where the sewerage goes to is quite another question.

2469. Assuming that Manchester was not in the difficulty of polluting the river by the discharge of its fœcal matter, would you then be of opinion that the present privy and ashpit system is the proper one to maintain?—I should certainly. I think it is preferable in the small houses to any attempt to introduce waterclosets, even if the question of fouling the river did not arise. I do not myself believe that it is at all likely that satisfactory arrangements for waterclosets will ever be made. But in connexion with that I may be allowed to make this statement. One of the greatest difficulties in connexion with the watercloset system is, where are you to get the water from. We have expended in Manchester as I have said nearly two millions. It is quite certain that taking Glasgow, Edinburgh, Dublin, and many other places, and taking the very lowest consumption of water where waterclosets are the rule, our waterworks would be totally insufficient for the supply of water that would be required for Manchester.

2470. You have given us the assessable value of Manchester and the amount of rates. Can you give

J. Heron, Esq.

7 June 1869.

us the rate per head of the population for the purposes already stated in your evidence?—The Township and Highway Rates, as already given in answer to a previous question (2363), would amount to the following sum per head, on the estimated population, viz.:—

Township.	Rates.			Estimated Population.	Amount per head.		
1.	2.			3.	4.		
	£	s.	d.		£	s.	d.
Manchester -	44,909	0	0	203,011	0	4	5
Chorlton - -	10,045	0	0	49,044	0	4	$1\frac{1}{10}$
Hulme - -	9,511	0	0	74,952	0	2	$6\frac{7}{10}$
Ardwick - -	4,431	0	0	23,810	0	3	$8\frac{6}{10}$
Cheetham -	6,090	0	0	19,042	0	6	$4\frac{7}{10}$
Beswick - -	515	0	0	964	0	10	$8\frac{2}{10}$

or if you take the whole amount of such township and highway rates, (75,501*l.*), and the whole population, (370,823), it is equal to about *four shillings* per head. If to the township and highway rates you add the water rates, (40,350*l.*), and the city rate, (109,000*l.*), the rates levied would amount to *twelve shillings and one penny* per head, upon the population of the city.

2471. You have spoken of the advantages of the water supply and the gas being in the hands of the local authorities instead of those of a company. Do I understand you to intimate your opinion that the Commission should recommend any further powers being given than at present exist for obtaining such works by the local authorities?—I think it is desirable to give facilities to the local authorities to obtain waterworks, and also to construct them where they do not exist. I do not think the powers do exist, but the recommendation was made by the Health of Towns Commission, I think in 1846, that gas and water should be in the hands of the local authority, and that every facility should be given for obtaining the necessary powers.

2472. Have difficulties in obtaining money for carrying out sanitary works arisen within your experience in other places besides Manchester?—I frequently hear that that is one of the greatest difficulties which local boards have to contend with, and certainly one of the causes which make them very unwilling to undertake works involving much expenditure. It is from what I have heard and what I know that I have expressed the opinion that increased facilities in that respect would very much assist them.

2473. Might it not be considered a hardship that the Secretary of State should have the power of inflicting a penalty upon a district for not carrying out works for which it was not in a position to obtain the money?—I do not believe that any district would be absolutely unable to borrow money, but I think it would be a very strong ground for an application to the Government to find the money, that is to say, through the Loan Commissioners, where that was the only difficulty in the way of the local authority carrying out the order of the Secretary of State. I do not believe that the Secretary of State would often interfere to the extent that might be apprehended, if it was shown that there was a willingness on the part of the local authorities to do what he suggested, and that the only difficulty was where the money was to be obtained.

2474. I understand it to be your opinion that sanitary works would be much more readily undertaken and gone into *con amore* by the local authorities if they saw the end with respect to money?—I have no doubt that that would be a very great inducement, and that they would be much more willingly undertaken when they saw that they could borrow the money at a reasonable rate of interest, and limit the expenditure per annum to the amount which would be required to repay it, say in 30 or 40 years.

2475. With respect to waterworks, do you think 30 or 40 years would be a sufficiently long time for repayment?—No; I think as far as regards waterworks, and many other works of a similar character, for instance, all works connected with sewerage, which are for the benefit of the whole district, the longer the time that can be given for the repayment of the money the better. I think it would only be fair and just to extend it over 100 years, but at the same time you cannot expect to get power to borrow money for that length of period. The power to lend the money would be limited to a certain moderate period. You could not expect the Government to lend money for 100 years, or 60 years, or 50 years, and probably they would not go beyond 30 years, but there might be power given to the local authority to reborrow, either from the Government or in any other way, provided that they repaid absolutely the amount of debt incurred at a rate which would destroy the debt within any period that might be fixed; a 100 years has been given I believe in some cases, and in some instances where the case has been very strong I do know that it has not been forced upon the authorities (it was not in the case of Manchester) to have a sinking fund for many years in reference to their waterworks expenditure.

2476. Do you think with respect to gravitation schemes of waterworks that there should be repayment at all?—I do not think it would be any very great hardship if repayment was not provided for, but I doubt whether it would ever be allowed by Parliament; I do not think that it would be unjust. I think that where they are works of a continuous character and for the benefit of a district, there would be (however long the delay fixed for the repayment of the money) a certain amount of injustice in making the ratepayers during that period pay the expense of works which would give an advantage to the ratepayers beyond without any charge whatever; but I do not think that it is likely to be sanctioned that debts are to be created without any provision for their ultimate liquidation.

2477. With respect to the Diseases Prevention Act, do you think that it would be desirable to intrust the Secretary of State, or some Government officer, with the power of extending the advantages of the Diseases Prevention Act, without the necessity of advertisement in the London Gazette?—Most decidedly. I think that this arrangement of advertising is like publishing that a place is subject to something like a plague. I think that the power should be given without any difficulty whatever, if sanctioned by the Secretary of State, and the less publicity given to it the better.

2478. (*Mr. Shaw.*) Upon that point you agree with the policy of clause 10 of the Sanitary Act Amendment of 1868, to which we drew Mr. Simon's attention the other day, which is to this effect: "The sewer "authority, or in the metropolis the nuisance authority, "shall have the like power to make provision for the "temporary supply of medicine and medical assistance "for the poorer inhabitants as it now has to provide "hospitals," and so on; or "but such power to make "provision for the temporary supply of medicine and "medical assistance shall not be exercised without "the sanction of Her Majesty's Privy Council?"—I would strike out the latter part, which I think is an objectionable part; it does not much matter if you are not obliged to go through the formalities fixed by the Prevention Act; then I see no objection to it whether it is the Privy Council or the Secretary of State.

2479. That is a principle which you would wish to see extended?—Yes, certainly.

2480. Would not that mee tthe difficulty which Dr. Acland asked you about; if there was an epidemic raging, the powers of the Diseases Prevention Act would be in existence, and all expenses would be recoverable as a matter of course if laid out by the guardians under the authority of the Privy Council; and if the epidemic was not raging within the meaning of the Diseases Prevention Act, still if there was a great degree of sickness you might empower the sewer authority to give medical assistance, and they would

be protected as to the expenses under this Act?—Yes.

2481. One way or the other the thing would be done, and the authority would be protected as to the expense?—Yes, I think so; I think that the guardians who really are the local authority should have the power to give medicine in such cases as are suggested, without going through the formality of obtaining the sanction of the Privy Council, and it seems to belong to them to find the money for such a purpose, because they are the sewer authority. No doubt the corporation both could and would do it, and in the case that I referred to they said the medicine must be provided, the guardians ought to provide it; but if they have any difficulty the medicine must be provided, and we must find the money if necessary.

2482. That power was given to the sewer authority because by the previous Act the sewer authority had the power of providing temporary hospitals, and it was thought proper to keep it in one hand; perhaps you would rather prefer that the power should be in the hands of the guardians?—Yes, I think that they do provide hospitals now to a certain extent, and I think it better that they should provide them to any extent that may be required.

2483. Have you ever had your attention directed at all, in connexion with the case of sewerage, to the injurious character of sewer gases escaping into the streets?—That question has arisen in this way: it is constantly the subject of discussion as to what arrangements are to be made for ventilating the drains of houses, and then for ventilating the sewers. I have always said, and the committee have taken my view of the case, that as far as regards the ventilation of the drains of houses, that is an expense which ought to be incurred by the owners of the houses; and that as far as regards the ventilation of the public sewers, in whatever way it might be thought to be desirable, that is an expense which properly belongs to the township, and ought to be paid out of the general sewering expenses. But by our original Act of 1844 the corporation are authorized to require a pipe to carry off the effluvia in such a way and in such a direction as they shall require; and I believe that the practice is to have a pipe in the yard in connexion with the privy and ashpit, communicating with the drains, and carried at any rate above the roofs of the houses, that is for the purpose of ventilating the drains of the houses. As far as regards the drainage of the sewers, I do not think that any very satisfactory steps have yet been taken in Manchester. That is one of the subjects which Mr. Leigh is specially inquiring into, and what he will ultimately advise should be done I am scarcely prepared to say.

2484. In short it is a question under consideration?—Yes, it is a question under consideration, but it is felt to be a very important question.

2485. As regards the 49th section, you contemplate the case where the nuisance authority refuses to do its duty?—Yes.

2486. That duty may possibly be one that it has not the power of doing itself, but something which it must enforce upon the householder by summoning him before a magistrate?—That may be.

2487. Does not it seem a little complicated for the Secretary of State to sue for penalties against the local board because that local board had not sued for penalties against somebody else?—I do not think that that case would very often arise; it does appear a little inconsistent, but at the same time it is very difficult to provide for every possible case that may arise. Supposing it is a nuisance arising upon the premises of some other party, and your local authority decline to summon, because perhaps they say, we do not think it is a nuisance with which we should interfere, I cannot imagine that the Secretary of State would ever put this power in motion in a case of that kind, because it is left to the individual who is annoyed by that nuisance to summon the party himself before the magistrates and get an order, and in any of those cases the Secretary of State would never exercise his authority; it would be like using one of Nasmyth's hammers to break an egg. He would leave it to the individual aggrieved. If it were a public nuisance, that could only be dealt with by the local authority; that would of course be a proper matter for the Secretary of State's interference.

2488. Supposing you had a whole street in which animals were kept—pigs for instance—producing an effluvium which is very injurious to health, or all the privies were in a bad state, the only remedy under the Nuisance Removal Act would be to summon the parties?—As I understand the clauses that have been already referred to, in cases of that kind the nuisance authority, or anybody aggrieved by the particular nuisance in question, could summon the party before the magistrates. Take the case that you suppose, of pigs being kept in a house, surely the man in the house adjoining would be able to summon him; but if you assume that they are pigs kept in connexion with every house in the street, and that therefore there is no particular individual annoyed by the pigs, then it might be left entirely in the hands of the local authority to interfere; but I can hardly imagine such a case to arise. I think that in the case of nuisances such as you have described, where they are nuisances arising from a foul privy and ashpit, or where they are nuisances arising from the keeping of pigs, they would be to a certain extent rather a private nuisance than a public nuisance; they would be nuisances to the people in the immediate locality affected; and in that case any individual aggrieved could, as I have understood the clauses that have been referred to, summon the party who either had a foul privy or had a foul pigsty before the magistrates, if the local authority neglected to do so.

2489. Supposing that you had a whole street or a whole town full of filthy privies, which is one of the main objects which the nuisance authority is set up to correct, and that the inhabitants are so lethargic that they might have the cholera amongst them, and you could not trust to their sense of what is wrong to act in the matter?—If a whole district is in that state of course it becomes a much more difficult and more important matter, but in that case I am satisfied that the machinery which I have suggested would secure something being done by the local authority more effectively than any other machinery that has been proposed. Of course when you speak of a whole street or a whole district being in that state, it clearly becomes a public nuisance with which the local authority would be bound to interfere, and even in that case, I think that the power which it is suggested in addition to what he now possesses should be given to the Secretary of State would be found to be effective, and there would be this advantage in summoning the parties before the magistrates, that there would always be in every district some intelligent inhabitants who would wish to see the local authority exercising its powers and would support them in carrying them out. I cannot conceive of anything which in my opinion would work more advantageously than, if the local authority was absolutely contumacious (if such a case can be supposed), summoning them before the magistrates, because in such a case the inhabitants of the district would have an opportunity of seeing how unreasonably those who professed to be their representatives were acting. I think that public opinion would be brought to bear both in support of the Secretary of State's interference and also to coerce the local authority to get rid of the liability to penalties.

2490. Would it be preferable for the Secretary of State to summon the local authority for not summoning or at once have the power of summoning the offending party?—I think that is a matter which really does not involve any very serious principle. I do not see any objection to it except that it would be imposing upon the Secretary of State or his officers a duty which would call upon them actually to interfere in districts where I think you might directly compel the work to be done by the authorities themselves.

J. Heron, Esq.
7 June 1869.

2491. Are you aware that under the Metropolis Acts an improvement of the very nature that you suggest has been carried out, that is to say, under the first Metropolis Local Management Act, the vestry, if a party did not drain his house sufficiently and would not obey their precept, would have the power to go in and do it, but that was found so very inconvenient that in the amended Act the option was given of suing for a penalty if the thing is not done?—It is the course which we have taken in all our local legislation. We very often have to come to Parliament to get improved powers. We have power to execute works of almost every sort, but we always have power in addition to impose a continuing penalty upon the owner if he does not do his duty, and we never think of doing the works. I do not suppose that the Secretary of State would ever have, through his officers, to do the work, even if he had the necessary power to interfere.

2492. As regards water supply, do you advocate the laying of it on to every house, or in the poorer districts would you lay it on in the middle of a court with a stand pipe to which everybody should have access?—We object to stand pipes and we are doing everything we can to get rid of them, although there are at the present moment a very considerable number, they have been reduced very largely, and we are so convinced of the desirability of having the water laid on into the premises rather than supplied by means of stand pipes that I think one of the last resolutions of the waterworks committee was to take upon themselves, which does not belong to them by law, the expense of carrying the water into the house, where they have removed the stand pipe in the court, and we have never heard it suggested that it led to dampness or anything of the kind. It must be seen that it is an infinite convenience, and we do not think that it would lead to any additional consumption of water, because the expense is very great to keep the stand pipes in order. They are constantly left running, and you require constant inspection; and we believe that the consumption and waste of water by means of stand pipes is far greater than the waste and consumption of water which would arise from anybody in cottages having nothing to do but to turn the tap instead of having to go out, perhaps in the cold and snow, to the stand pipe to wait, with perhaps their neighbours waiting also, to get water there.

2493. (*Mr. Powell.*) You were asked certain questions respecting what could be done in the event of the nuisance authority doing nothing. When you answered those questions had you in your mind the 16th section of the Sanitary Act of 1866 which runs thus, "In any place within the jurisdiction of a "nuisance authority the chief officer of police within "that place, by and under the directions of one of "Her Majesty's Principal Secretaries of State, on "its being proved to his satisfaction that the nuisance "authority has made default in doing its duty, "may institute any proceeding which the nuisance "authority of such place might institute with respect "to the removal of nuisances;" does that appear to you to be a sufficient provision in case of inaction on the part of the local authorities?—It appears to me to be quite ample. As to the chief officer of police, I suppose that would be the chief officer of police in every place, either a county or borough.

2494. You have pressing upon the boundaries of Manchester a considerable urban population divided into districts each under its own authority?—Yes.

2495. Do you find any desire, either on the part of those districts to be comprehended within Manchester or on the part of Manchester to comprehend any or all of those districts for sanitary purposes?—There has been a desire on the part of some, but certainly there has been no anxiety shown on the part of the corporation to include them, and there have been no serious or very decided steps taken by any outlying district to get included within the limits of the corporation.

2496. I presume that in the case of Manchester, as in other cases of the same kind, the rates in the outlying district are less than the rates of the central district, and consequently there might be some indisposition from a fear of the increased pressure of rating?—I think that that is very likely indeed. Where there is nothing done no expense is incurred. There is no doubt that the difficulty of introducing those provisions generally would be the dread on the part of the district of the increased rates which must necessarily follow.

2497. Can you explain how the Acts in force in Manchester stand with regard to that most delicate and difficult point, the power of entry upon private property by the officers of the local authority?—I really cannot give any very precise answer to that question beyond this: We certainly have no absolute power of entry in any case, and I do not think it is right that we should have. We have always to apply to the justices, showing the necessity for it, in order to obtain the necessary authority. I consider that it would be most objectionable to give to any local authority or their officers, because it must be borne in mind by whom the power is carried out, any absolute right of entry when refused upon private premises.

2498. Would you allow a private individual to make such a representation to the justices as might authorize the local authority to enter in case the private individual supposed that there was some mischief on some private premises?—I do not quite understand how a private individual could be placed in that condition. If it were suggested and shown to the local authority, and there did appear to be a necessity for entering premises, of course, if refused, they would have to satisfy the magistrates that there was a sufficient case, when the evidence of any private individual might be given, but I do not see exactly how a private individual could in any way have to apply for the officer of the local authorities to enter private property.

2499. A private individual may obtain a summons, may he not?—Yes.

2500. Why should not a private individual go to the local authority and say, "You have not properly "exercised your power, and you are neglecting it at "your own peril"?—If a private individual brought a party before the magistrates, then the magistrates would have the same power, whether for entry or anything else, that they would have if the proceeding had been initiated by the local authorities.

2501. Speaking generally, and avoiding any technicalities, could you explain to the Commission what powers you have in Manchester which are given by your local Acts, and which are not conferred by the general Act?—I might say that there are certain provisions upon many subjects, especially in connexion with preventing the waste of water, and a variety of other subjects, where we have, I believe, some provisions which are not in any public general Acts.

2502. But it would not be inaccurate to say that those differences in favour of the authorities rather relate to matters of detail than to large matters of broad principle?—Certainly, as far as regards matters of broad principle, I believe the clauses practically are the same.

2503. Comparing the powers under the general Act, 1848, section 64, respecting offensive trades with the bill which you have before Parliament, there is a broad difference, is there not?—There is.

2504. Will you explain that difference?—When the bill was before Lord Redesdale he said, and very naturally too, "You do not mean to say that the local "authority is to authorize a trade which is a nuisance "to be established in its district." I could only say that we had taken the clause as it appeared in the public Act. His lordship said, "Strike out those "words." I said, "As far as we are concerned we "think they are better out than in. It is a discretion "given to the local board which certainly may lead to "considerable inconvenience," and he said, "Strike "them out," and we therefore have the clause in that bill, but with the omission of those words "without

"the consent of the local board." It is absolutely prohibitory to establish a trade which would be a nuisance within the city.

2505. Is the term "nuisance" employed, or "offensive trade"?—"Offensive trade" are the words; it is in our bill the same, "or other noxious or offensive "trades shall not be established," and the same words are used, with the single exception that the words "without the consent of the local board" are omitted.

2506. Have you in your mind any mode by which the action of the local authority could be quickened, supposing there was some neglect of duty on the part of that authority. The neglect which occurs to my mind is one of which I have had some experience, where the local authority has not performed its office of removing nightsoil?—I really have not considered that. Perhaps one reason is that the duty is imposed upon the corporation of Manchester, and I always assumed that it would be efficiently carried out. I have not had to consider what steps would be required, and I have not considered the question.

2507. You are probably aware that the suggestion of the employment of one officer only to collect the different rates emanated from Mr. Ayrton's committee last year?—I believe that some such suggestion was made by that committee.

2508. And it was part of the suggestion, was it not, that in the event of loss by arrears or ultimate deficiencies, that loss should be borne rateably between the different rates?—I am not aware at all of the nature of the provisions.

2509. But do you think there would be any difficulty arising from the fact that you would have the same collector serving different masters?—That would not practically be the case as far as the local rates are concerned, because the only masters that would be engaged in the matter would be the overseers, and their collectors would collect in the shape of poor rates that which would really include all the other rates. The practice is now, with the overseers of Manchester, to state on the back of their notices how much of the rate is required for the purposes of the city, how much is required for the purposes of the guardians, and how much is required for general purposes; and they would add to that what was required for highway rate and what was required for the township rate.

2510. Has not the health authority at present the power beyond their district to make drains for the outfall and distribution of sewage?—I believe that is given by the general law.

2511. We will suppose that two districts lying close together, and each independently making its own drains for the outfall and distribution of sewage, does it not appear to you to be far more convenient that those two districts should unite for the purposes of the outfall and distribution of sewage?—It appears to me not only more convenient, but that it will become absolutely necessary.

2512. If that be the case with respect to two towns lying near together, whose drains for the purposes I have mentioned would be probably parallel, is it not likewise equally necessary that the towns above should unite with the two towns below for the construction of such a drain as would be necessary for the joint use of all the district?—I have no doubt that that is so, and that it would be absolutely necessary that the whole drainage area should unite and be taxed in some way for the payment of any works of that character that might be required for the whole district, beginning with the very source, and going to the very end.

2513. In Lancashire is it not the fact that owing to the deficiency in volume of the streams, there is not sufficient flow of water to carry off the sewage matter?—I do not know whether I can say exactly yes or no to that question. There is no doubt that at times our streams go down very low in the summer, and they are certainly not in a very satisfactory condition; they are dependent very much, perhaps entirely, upon the scouring or cleansing which, to a certain extent, is secured by the operation of floods.

2514. Would it be possible to discharge the sewage of Manchester into the Irwell during the summer?—A portion of the sewage is now discharged into the Irwell, but the main outfalls are into the Medlock, and such river is bad enough as it is, but if the privies and ashpits had been turned into waterclosets, and the sewerage turned into it, such river would have become intolerable.

2515. That being the case is not this the result, that there is a question of very great difficulty affecting the discharge of the sewage of those great communities, entirely distinct from and independent of the question of keeping such small rivers as you have pure?—There is no doubt about it that that is a very difficult question, and as far as our particular district is concerned, it is intimately connected with the nature of the powers which will have to be given to local authorities, if they are to deal effectively with sanitary subjects. I believe that the construction of an outfall from Manchester to sea would cost 1,000,000*l.* sterling.

2516. If there were to be a drain of the character that I have suggested erected in common by the different localities, of course the rate for the construction of it and the management generally ought to be vested in some joint authority?—Necessarily, I think, in a board that would represent the whole area that would be subject to a taxation.

2517. With regard to the Artizans and Labouring Classes Dwellings Act, the town clerk of Liverpool stated that there might be a technical difficulty, of which he had some apprehension, under the fifth section, under which representation is to be made to the local authority where any premises are in a condition or state dangerous to health so as to be unfit for human habitation, and he said that each individual set of premises might not be dangerous, but that the crowding together of a great many might be dangerous, and that an objection might be taken if steps were initiated, on the ground that there was no scope for action for the reason that I have stated?—I do not anticipate that much difficulty would be found. In most cases the whole of the cottages would in all probability be declared to be unfit for human habitation because of either the want of ventilation or the want of proper arrangements, but I do not myself think that any practical difficulty would arise from any such objection as was suggested by the town clerk of Liverpool.

2518. In your own case you have put the Act in force and have found no difficulty?—I must not be understood to say that we have done much beyond beginning. There are certain steps, and it involves a lengthened period of time before you get to a conclusion. We have not yet discovered that there is any practical difficulty in the way of working the Act, and I do not myself think that there is.

2519. The astute minds of those who are so ready to find out a defect in all legislation affecting them, has not yet discovered it?—We have not yet heard of it.

2520. (*Mr. Cave.*) I do not quite understand what the duties of your medical inspector are?—We have no medical inspector exactly, but we have an officer of health who does happen to be a medical man.

2521. Should you consider that it was necessary that the officer of health should always be a medical man?—No, I do not think so. Of course I express that opinion with very great diffidence, but I think there are a very great many questions in towns which seriously affect health, and which probably would be even better understood by a gentleman who was not a medical man. I do not think it is at all necessary that he should be a medical man.

2522. What class of cases are those to which you allude?—I think it does not require a medical man to see, when he goes to inspect property in close and confined courts and passages, where he meets with a want of ventilation, and a want of proper conveniences, and a vast variety of other circumstances connected with the property, that there ought to be a change in order to

J. Heron, Esq.
7 June 1869.

improve the sanitary condition of the property itself, and of that district.

2523. Does your officer of health attend to give evidence in court of the cause of death?—No, not necessarily; he attends to give evidence sometimes in cases where parties are summoned for offences of a nuisance character, and in cases in which his opinion is thought to be likely to be valuable he attends, but not in cases of death where there happened to be an inquest, except he should happen to have attended upon the unfortunate person who has come by his death.

2524. Has he any staff under him?—Yes, he has a surveyor and clerks of course; but we have only had an officer of health I think about 12 months, or something like that.

2525. What would be your opinion of the advantage of having a first-class medical man as an officer of health, with all those inspectors under him whom you have mentioned in the course of your evidence?—I do not think it would be at all desirable to alter the mode of action which we have adopted in Manchester. The officer of health to a certain extent is an independent officer, and has a perfect right to express any opinion he thinks fit, and whenever necessary to recommend any course to be taken, and the responsibility of not carrying out what he recommended would rest with the council, but I think it would be very inconvenient to put the large number of necessary officers connected with the general business of the corporation under the control of any officer, either the officer of health or anybody else.

2526. Supposing you had such a system namely, a sort of consolidation of inspectors, would that conduce to economy do you imagine?—I do not think it would at all, at least not in Manchester. I am of course speaking of ourselves, and I do not think it would lead to the slightest possible economy.

2527. You think that it would be better that he should be the servant of the local authority?—Yes, certainly.

2528. Leaving that authority to consider what should be the number and classes of inspectors to carry out their arrangements?—Yes, certainly.

2529. You state broadly that you would only have in any case two authorities, the local and the central?—I think so, decidedly.

2530. With the magistrates as an executive body to carry out the law simply?—Yes, I think so, decidedly.

2531. If the magistrates in petty sessions had the duty of inflicting fines for the non-fulfilment of the obligation placed upon the district by the Secretary of State, would not there be some difficulty with regard to the evidence brought before them in such cases?—No, because in my opinion the evidence would be exceedingly simple. The only facts which would have to be proved before the magistrates would be simply that an order had been issued by the Secretary of State, and served upon the local authority, and that for the time mentioned in such order no steps had been taken to comply with it. The duty of the magistrates would be ministerial; they would be obliged to impose penalties, and if they had any discretion at all it would only be as to the amount of the penalties; and if they did decline to convict, a mandamus would issue as a matter of course to compel them. As I say, their duty would merely be ministerial.

2532. You think that their duty would be very simple in such cases?—I do not see why there should be any difficulty.

2533. Might you not have difficult questions of degree in cases in which the order of the Secretary of State was partially or ineffectively carried out?—I think that that should be left entirely to the Secretary of State. I do not suppose that extreme measures would be taken if the local authorities were showing any disposition really to deal with the question which might be the subject of the order, and unless they satisfied the Secretary of State in some way or other, it would leave them liable to penalties.

2534. Would you propose that the Secretary of State should appear (not of course in person) before the magistrates and state that his order had not been complied with?—There would have to be some arrangement as to how that proceeding would be initiated. I have hardly gone into those matters of detail, but it would be entirely a ministerial act involving little or no responsibility, and I do not see that there could be any difficulty in determining in what manner application should be made to the justices.

2535. Have you considered at all the class of inspectors that ought to be sent down by the central authority, supposing it were the Secretary of State, in cases of complaint?—No, I really have not, because I think that would depend, to a great extent, upon the nature of the complaint and the probable duties which would have to be discharged by the inspector. If, as has been suggested, there was a consolidation of engineering inspectors and medical inspectors, and they were acting under the same central authority, either an engineer or a medical man would be sent down, according to the nature of the subject which he would have to investigate.

The witness withdrew.

E. J. Hayes, Esq.

(14.) Edwin John Hayes, Esq., examined.

2536. (*Chairman.*) You are town clerk of Birmingham, are you not?—I am.

2537. Were you before that town clerk of Wolverhampton?—I had been town clerk of Wolverhampton for 12 years.

2538. How long have you been town clerk of Birmingham?—Three months only.

2539. Then your chief experience of the working of local government has been in Wolverhampton?—Yes.

2540. What has been the local government there?—It is a municipal corporation under the Municipal Acts, a local board of health under the Public Health and Local Government Acts, and the town council in their municipal capacity and also as a local board of health, possess other powers under "The Wolverhampton Improvement Act, 1831."

2541. Is it a borough?—Yes; and the town council are the local board of health.

2542. Have you adopted the Local Government Act?—Yes; the council adopted the Public Health Act immediately upon its coming into operation in 1848, and from the passing of the Local Government Act of 1858, the latter Act has been in operation in the borough.

2543. How have they worked?—We have found, in consequence of the numerous provisions of the other Acts incorporated in those Acts, and also of the other Acts which have been passed since, and which have more or less to be worked with them, very considerable difficulty; for instance, there has been the Public Health Act and some amendments of it; the Local Government Act of 1858 and the amendment of it in 1861; numerous Nuisances Removal Acts and various incorporated Acts, and all of them, have been more or less in operation in Wolverhampton and many other towns similarly situated, and it has been found extremely difficult, and in fact occasionally almost impossible, to carry out the provisions of those Acts. We found considerable difficulty, for instance, when the Sewage Utilization Act of 1865 passed. A minute of instruction was issued from the Local Government Act Office stating that a sewer authority existed everywhere, and giving instructions to the sewer authorities for the carrying out of the provisions of the Act of 1865. I found, upon looking at the Sewage Utilization Act of 1865, that Wolverhampton at all events was not a sewer authority, nor indeed was any town that was similarly situated, that is, where the

Public Health and Local Government Acts were in operation, for one of the sections, especially exempts from its operation all places wherein the Public Health Act and the Local Government Act were in operation. It is the second section of the 28th and 29th Victoria, chapter 75, "This Act shall "not extend to any part of the metropolis as "defined by the Act of the session, 18th and "19th years of the present reign, chapter 120, "for better local management of the metropolis, and "shall not, with the exception of clause 15, extend "to any parish as defined in the schedule to this "Act, in a part of which parish the Public Health "Act, 1848, and the Local Government Act, 1858, or "one of such Acts, is in force at the time of the "passing of this Act."

2544. The second section of the Act of 1865 which caused the difficulty to which you refer was repealed, was it not, by the Act of 1867?—Yes.

2545. So that the difficulty to which you refer occurred between the Act of 1865 and the Act of 1867?—Yes.

2546. Are there any other instances in which numerous Acts upon this subject have produced conflict and difficulty at Wolverhampton?—Yes. With regard to the power to make byelaws, the Local Government Act, 1858, section 34, enacts that every local board may make byelaws with respect, amongst other things, to the sufficiency of space about buildings, and to the closing of buildings or parts of buildings unfit for human habitation, and to the prohibition of their use for such habitation, but there is a proviso to that section which makes it virtually a dead letter; it is in these words, "provided always that "no such byelaws shall affect any building erected "before the date of the constitution of the district." Some byelaws framed under that section came before the Court of Exchequer in the case of Burgess *v.* Peacock, 4 New Reports, page 365, where a local board, in pursuance of section 34 of the Local Government Act, made a byelaw closing a house, and it was held that they had no power to do so. I am not aware that any Act exists which gives the power that was evidently contemplated by that section, so that the very class of houses, namely old and ruinous dwellings, that requires supervision, is exempt.

2547. Is not the town of Wolverhampton at this moment going to Parliament for an Improvement Act?—Yes.

2548. And the object of that bill is to codify the whole of the law so far as Wolverhampton is concerned? It has been found so difficult to carry out the provisions of the public and incorporated Acts that it has been deemed desirable by the town council to place in an intelligible form and under appropriate headings, such as streets, buildings, police, police regulations, sewers, markets and fairs, parks and other things, all the provisions that they think necessary for the good government of their town.

2549. You mean that actually Wolverhampton has found the confusion of the public Acts so great that they are going to Parliament privately to codify the public law for their own purposes?—Yes; for these amongst other things. They have recently acquired the waterworks, and there were six Acts of Parliament in relation to the waterworks in existence, five private Acts, and the Waterworks Clauses Act, but with the exception of the waterworks they have no undertaking of a public nature; they do not own the gas; they are not a burial board, nor indeed is there anything exceptional in Wolverhampton.

2550. Will this bill which they now have before Parliament for the purpose of consolidating the law, consolidate not only the public law, but any private Acts that there are?—My plan was to repeal or make inapplicable to Wolverhampton the existing public and local Acts, and to codify them, adding such other powers as the wants and circumstances of the locality required. As to the waterworks the companies, to whom the corporation have to make annual payments, objected to the repeal of their Acts, and the framework of the bill has therefore been altered. We are to schedule in the Act such of the provisions of the existing Water Acts as we think should apply so far as the corporation is concerned, but without repealing the Water Acts. The bill will render inapplicable after the passing of the Act the Public Health Act, the Local Government Acts, and other scheduled general Acts, so far as Wolverhampton is concerned.

2551. If this bill passes, there will be but one sanitary law for Wolverhampton in the shape of local government, and outside that there will be nothing but certain Waterworks Acts?—The Sanitary Act, 1866, will still apply, as will also certain other general Acts. One of the objects of the bill also is to obtain additional borrowing powers. There were considerable difficulties about the sewage; Wolverhampton naturally is well drained, but one of the great difficulties in carrying out the system of main sewerage was the outfall. By arrangement with the owners of land and with the canal and railway companies a scheme of sewerage has been adopted and is now being carried into operation, one of the objects being to utilize the sewage on land, and with this view an estate has been purchased about three miles from the town; the purchase money is not yet paid, and one of the objects of the bill is to enable the corporation to borrow money on the security not only of the rates, but of the estate itself, to pay the purchase money. It is quite a new idea. I know of no other instance of similar borrowing powers. A power is inserted in the bill to give the estate itself as the primary security, and, as a collateral security, the rates. The result will be that the town will be able to borrow money at a comparatively low rate of interest, and the ratepayers of the present generation, and the next, and perhaps for several generations to come, will only have to pay the interest on the money, whilst the Green Field security, which is yearly improving, will remain intact and always be a good security for the principal. In my judgment such a power as that, which, I may observe, Lord Redesdale at first objected to as being unreasonable, will be extremely useful in Wolverhampton and other towns for sewerage purposes. The ordinary mode has been to pay off, by way of terminable annuity, a thirtieth part of the principal in addition to the interest; and by my plan the town would not have to pay off any part of the principal so long as they arranged for the continuance of the mortgage, thus making a difference in their favour in this respect of 1,000*l.* per annum, equal in Wolverhampton to a rate of about 1½*d.* in the pound.

2552. Is it your opinion generally that the borrowing powers are not sufficient for local authorities?—Yes, I have found it so in my experience. I think in the instance that I have named they are defective, and there should be a power to mortgage the property of the corporation or local boards as well as the rates.

2553. With that additional power, do you think that the borrowing powers would be sufficient?—I think that the Public Works Loan Commissioners should have power to lend for a longer period than they at present have. I believe that their power is now limited to 20 years, and I think it should be a very much longer period, say 50 or 60 years; and they should also have power to take such a security as I have referred to. It would be much preferable to the present mode of borrowing, a great saving to the ratepayers, and consequently an inducement to them to execute works of sanitary improvement which they at present hesitate to undertake on account of the heavy annual cost.

2554. And what do you think of the terms upon which the commissioners lend, and the conditions of repayment?—I think that they should lend at as low a rate of interest as possible, particularly when the primary security can be made the property purchased with the money borrowed; and that the period for repayment should be considerably extended.

2555. How do you find the local government of Birmingham conducted?—My experience of Birmingham has extended over only three months. At present I find that they have the Municipal Corpo-

E. J. Hayes, Esq.

7 June 1869.

rations Act, and two Improvement Acts, the one passed in 1851 and the other in 1861. Some of the Public Acts are incorporated in the Improvement Acts, and there are other General Acts in operation in Birmingham.

2556. So that they adopt the Public Acts for certain powers in their local Acts governing the organization of the authorities?—They do so, but many of the General Acts are also in operation in Birmingham.

2557. Is there not a section in one of their local Acts which subjects their power of improvement above a certain amount to the control of a majority of the ratepayers?—Yes, it is so. Their improvement rate is limited to 2*s.* in the pound, and their street improvement rate as distinguished from the improvement rate, is limited to 6*d.* in the pound; and those two amounts cannot be exceeded except with the consent of the ratepayers, nor indeed, I believe, can the council again go to Parliament for any extended power without the assent of the ratepayers.

2558. Can you tell us to what extent the rates in the pound for the improvements have ever amounted in Wolverhampton; the largest amount you recollect?—I believe that 2*s.* 4*d.* or 2*s.* 6*d.* might be taken as the maximum for all purposes. There used to be a general district rate and a special district rate, a lighting rate, and a footway paving rate. Those were under the Public Health and Local Government Acts, but under the improvement bill, if passed, they will be abolished, and in lieu of them one rate will be levied to be called the improvement rate, and without a limit.

2559. Are those rates independent of the poor rate?—Yes, and they are also independent of the borough rate, which is collected with the poor rate under the powers of the Municipal Corporations Act.

2560. When you speak of 2*s.* 6*d.* in the pound being the largest amount of rates that you recollect for local purposes, what were the local purposes included in that?—That would include everything that could be done under the powers of the Public Health and Local Government Acts.

2561. There would be the poor rate besides, and the borough rates besides, would there not?—Yes.

2562. Can you state what the whole amount of the local rates has ever reached to in your recollection at Wolverhampton?—I should think that the average has been about 5*s.* in the pound, 6*s.* 8*d.* was, I believe, the highest, and about 4*s.* the lowest.

2563. What is the population of Wolverhampton?—In the municipal borough the population last year was 68,000.

2564. Has the local government of Wolverhampton been really effective in removing nuisances?—Yes, they have been exceedingly successful as far as their powers have extended.

2565. Can you state what the mortality of Wolverhampton has been for the last ten years?—Yes. The Sanitary Committee, in November 1868, laid before the town council a statement showing the number of deaths during the then past year, and also the number during the nine previous years. The deaths were—

For the year ending 30th September	1859	1616
„ „	1860	1640
„ „	1861	1518
„ „	1862	1538
„ „	1863	1804
„ „	1864	1693
„ „	1865	1653
„ „	1866	1849
„ „	1867	1516
„ „	1868	1806
Total for the ten years		16,633
Average of ten years		1663
Deaths in 1868		1806
„ 1858		1462
Increase		344
Population in 1868, about		68,000
„ 1858, „		58,000
Increase		10,000

In 1868 the deaths were 1 in 37 of the population; in 1858, 1 in 39.

2566. Do you consider the mortality high or low?—Much higher than it ought to be.

2567. Why do you think it is so high?—Primarily because there is no system of main drainage of the borough. Surface drains exist and are very objectionable. There are open ditches in the town, and similar sources of evil which would be remedied if the main drainage works were in operation. They are now in course of construction, and in my judgment will prove of great benefit, and reduce the rate of mortality.

2568. How far has smoke consumption been carried out in Wolverhampton?—Not at all; no steps have been taken.

2569. Do you believe that the smoke might be consumed there?—I have heard that several patents have been in operation by persons in the neighbourhood, and that in the instances where they have been used they have been successful.

2570. Can you tell us the rate of mortality at Birmingham?—It is exceedingly low. I noticed last week that it was about the lowest of all the large towns in England.

2571. Can you at all attribute that to any particular cause?—I should think possibly it would be attributable to the favourable situation of the town naturally, and the sewerage works being in operation, and also to the admirable system of inspection of nuisances throughout the whole of the borough.

2572. Have you any suggestions to make as to the alteration of the law, either with regard to local government purposes or nuisance removal?—I will put in, if you please, a letter that I was asked to write to the Secretary of State in September 1865, when Sir George Grey filled that office. That letter was printed and sent to the members of both houses of Parliament, and a scheme is there annexed as to sewerage. With the permission of the Commission I will put it in as expressing my opinions, and it is as follows:

"Town Clerk's Office, Wolverhampton,
"Sir, 9th September 1865.

"It will be within the recollection of the authorities of the Local Government Act Office that on several occasions I have had the honour of communicating with them relative to the necessity for further legislation of a general nature, at the instance of Her Majesty's Government, for the improvement of the laws affecting local government and the public health.

"In November last, as clerk to the local board of health of this borough, I received a circular letter from the office, requesting suggestions for the amendment of the Local Government Act. My experience of its working in this district induced me to make further communications upon the subject to the department of which you are the head; and I indulged the hope that during the last session of Parliament the Public Health Acts, the Local Government Acts, the Removal of Nuisances and Diseases Prevention Acts, the Common Lodging Houses Acts, and the several other statutes relating to the good government and health of towns—all of which are more or less defective—would have been swept away and replaced by a well-considered measure, embracing in one statute, with all requisite amendments, the entire law upon these all-important questions.

"The circular recently addressed by the Privy Council to the mayors of towns and other local authorities, in consequence of the threatened outbreak of cholera, has lead me to address you, with a view of pointing out some of the difficulties under which local boards of health labour.

"It is popularly believed that governing bodies in towns are invested with ample powers for the removal, in a speedy and inexpensive manner, of nuisances prejudicial to the public health, for the removal of houses unfit for human habitation, and, in fact, for the accomplishment of every requisite improvement of a sanitary nature.

"The Local Government Act, 1858, sec. 34, enacts that every local board may make byelaws with respect (amongst other things) to 'The sufficiency of the space about buildings, to secure a free circulation of air, and with respect to the ventilation of buildings. With respect to the drainage of buildings, to waterclosets, privies, ashpits, and cesspools in connexion with buildings, and to the closing of buildings or arts of pbuildings unfit for human habitation, and to prohibition of their use for such

'habitation.' But this power virtually becomes a dead letter, owing to the following proviso: 'Provided always, 'that no such byelaw shall affect any building erected 'before the date of the constitution of the district.'

"I apprehend that the term 'constitution of the district,' means the date of the application of the Public Health Act and Local Government Act to the particular district. The Public Health Act, 1848, was applied to Wolverhampton shortly after the passing thereof, and the Local Government Acts are also in force in this borough.

"Byelaws were framed and published by the authorities of the Local Government Act Office, under the power supposed to have been given by the 34th section, and issued as models for the use of local boards of health, and were adopted with certain alterations approved by the Home Office, not only in this borough, but I believe, in most places throughout the kingdom where the Public Health and Local Government Acts were in operation, and no local Act existed giving more ample powers.

"Serious doubts arose about the validity of the byelaws above referred to, as applicable to old buildings, *i.e.*, any building 'erected before the date of the constitution of the district;' and the judgment of Chief Justice Erle, in the case of Burgess *v.* Peacock, 4 New Reports, 365, shows that where a local board, in pursuance of a byelaw under the 34th section of the Local Government Act, closed a house they deemed unfit for habitation, which had been built prior to the constitution of the district, they had no power to do so. Other decisions of the superior courts also show that, in consequence of the restrictive proviso set out above, many of the byelaws suggested by the Local Government Act Office, and issued for the guidance of local boards, cannot be supported. Indeed, circulars emanating from the office in June and November 1864 refer to the difficulties I have pointed out; and in the latter circular Mr. Tom Taylor, the secretary, states:—'Difficulties of which you may be aware 'have been experienced in enforcing the byelaws framed 'under the 34th section of the Local Government Act; 'moreover, the provisions of the section as it stands have 'been held to limit the powers of local boards under 'the section to buildings erected after the adoption of the 'Act, thus excluding from control the very description of 'buildings which, as a general rule, most require super-'vision and improvement.'

"It is true that by the Nuisances Removal Acts some very salutary provisions have been made, whereby justices are enabled to prohibit the use of houses unfit for human habitation, and local boards are empowered to execute the order of justices, in the event of default of the owner or occupier; but, as is observed by Mr. Lumley, in his work on the Acts (2nd edition, p. 30), 'The statute also provides 'that the premises against which the order shall have been 'obtained shall be chargeable with such costs, expenses and 'penalties to the extent of a year's rackrent; but it is 'not clear how this provision is to be rendered available. 'No process is supplied whereby an occupier or owner 'is to be attached in respect of the default of his pre-'decessor.' Independently of this defect, the power contained in the 13th section of the Act of 1860 is too limited, inasmuch as it only empowers justices to prohibit the using of houses unfit for human habitation until the same are rendered habitable. As frequently happens in large towns, nuisances in connexion with houses are so inseparably connected with the houses themselves, that the removal of the houses would alone insure a satisfactory and permanent abatement of the existing evil; and, in order to obtain such a result, additional powers should be given to justices, whereby the houses which in reality create and foster many of the nuisances could be entirely demolished. I specially refer to houses in districts where numbers of miserable two-roomed dwellings are so crowded together and exposed to the pestilential exhalations of the cesspools and privies which surround and form part of them, as to render it practically impossible to apply with success the present powers. Fever and diseases of the most virulent nature are the characteristics of these localities, and yet the same state of things must continue until some stringent provisions of the legislature can compel the owners to take down these wretched dwellings and replace them by more open and spacious buildings. It may be urged that such a measure would operate unduly against owners, on account of the cost of executing the work, but a regard for the health and lives of those poor creatures who are obliged to eke out a lamentable existence in these noisome colonies is paramount to any mere pecuniary consideration.

"A still greater evil exists. I refer to the want of comprehensive and compulsory powers for the main drainage and sewerage of towns.

"In this borough, with its population of between 60,000 and 70,000 inhabitants, the existing sewerage is extremely defective. Difficulties, numerous and great, have been overcome; a plan for the proper sewerage of the entire borough has been very carefully prepared by direction of the town council; the details of it have been checked under the superintendence of civil engineers eminent for their knowledge of sanitary requirements. The government inspector, Mr. Rawlinson (who knows Wolverhampton well), has inspected the proposed outfalls, carefully examined the scheme, made suggestions thereon, and finally approved of it. It has also met with your approval, and you have given your sanction to the loan required for the execution of the works, and I believe that the scheme has also met with the general approbation of the inhabitants, and that the public voice is strong in favour of its being carried out.

"Anyone unacquainted with the legal difficulties which beset such an undertaking would naturally inquire why we have not proceeded with it. The inefficient state of the present law supplies the answer. Local boards of health have not sufficient powers to effect main sewerage works without embroiling themselves in litigation, entailing upon their constituents heavy consequent expenses, and having their operations paralyzed by injunctions when the powerful aid of the Court of Chancery is sought.

"The restrictive provisions of the Public Health Act rendered it practically impossible to sewer a town situated as this is; and I am informed by those who are well able to judge that from the favourable conformation of its surface, Wolverhampton is in an engineering point of view, not by any means difficult to sewer. The Local Government Act of 1858 extended the sewerage powers, but not sufficiently. That Act was amended in 1861, and it was then hoped that at last all towns could be properly sewered. The steps to which I have referred were accordingly taken by the town council, but I still doubted the sufficiency of the powers granted by Parliament. I therefore prepared an elaborate case, wherein all these powers were stated, and the difficulties presenting themselves fully referred to. The advice of eminent counsel, including Mr. Powell, Q.C., the recorder of this borough, was taken; consultations were held, attended by gentlemen thoroughly acquainted with the details of the proposed scheme, the requirements of the inhabitants and the obstacles to the accomplishment of the object in view; the case was most ably considered and answered, and the opinions thereon confirm the impressions I had formed that the powers were defective, and further legislation was absolutely requisite.

"The voluminous and important evidence given before a Select Committee of the House of Commons on the sewage question in June 1864 has only to be referred to for the purpose of demonstrating the soundness of counsel's advice. Birmingham, Coventry, Leamington, Croydon, and numerous other places might be mentioned where large sums of money have been spent in the execution of sewerage works, in the expectation that the legislative powers were ample; long and expensive litigation has ensued, and finally injunctions have been granted materially interfering with the completion of the works. According to the following extract from the evidence of Mr. Tom Taylor (page 165 of the Committee's report), it would appear that a most deplorable state of things exists at Hitchin, in consequence of an injunction having been obtained against the local board of that place. The evidence runs thus: 'Was not 'an injunction obtained at Hitchin?—Yes. What was the 'result of that?—The result of that case was to suspend 'the operations of the local board at Hitchin. The board 'were so afraid to go on with their functions, in conse-'quence of their liability to proceedings, that they resigned '*en masse*. No other members came forward for re-election, 'and Hitchin has been without a local board ever since. 'A receiver has been appointed under statutory power to 'obtain in the shape of rates the interest on the loan 'which has been raised at Hitchin, for the sewerage of the 'town, but there is no body at Hitchin exercising the 'functions of a local board. What becomes of the sewage 'now?—I presume that, so far as the works are completed, 'it runs into the river; but, inasmuch as there is no body 'against whom the persons aggrieved can take proceedings, 'proceedings have not been taken. In fact, the only 'change is that the river has not been freed from the 'sewage, but that the town has been freed from the local 'board?—Yes.'

"Even if such revelations as the foregoing evidence discloses stood alone, local boards might well pause ere they committed themselves to a fate such as that which has befallen the towns I have mentioned. Therefore it is that in Wolverhampton the scheme for efficiently sewering the town is inevitably held in suspension.

"Parliament is apparently unaware of the defective character of the Acts above referred to, for the only statute passed since 1861, having immediate reference to sewage questions, 'The Sewage Utilization Act, 1865,' by sec. 2. excludes from its application those parishes where the

E. J. Hayes, Esq.

7 June 1869.

Public Health Act, 1848, and the Local Government Act 1858, are in force; thereby assuming and, as it were, declaring the provisions of those statutes sufficient.

"Companies formed for commercial purposes and with the object of enriching their shareholders, have comparatively little difficulty in obtaining compulsory powers of the most complete character, whilst the legislature has withheld from those whom it has charged with the administration of the laws affecting the public health those efficient legal provisions essential to the due discharge of the duties imposed upon them.

"Towards the close of last year, and before the debates upon the Sewage Utilization Bill took place, a deputation, composed of representatives of governing bodies from many of the large towns, waited upon you, when a discussion ensued upon the sewage question. Acting on the invitation then given I had the honour of forwarding to you a list of suggested provisions* to be inserted in any general Act of Parliament upon the subject. The opinion of counsel before alluded to also contains suggestions of a like nature. They are as follows:—

"'We think a general Act on the subject is desirable and necessary, and our view of the kind of legislation required is this:—

"'That local boards should be empowered to prepare a map or plan, which should be deposited in some convenient place.

"'That public notice should be given of the scheme, and of the place where the plan of it was so deposited for inspection.

"'That notice should be served upon the owners and occupiers of the lands to be entered upon, &c.

"'That persons interested should be at liberty to object in writing to the whole or any part of the scheme; and such objections should be heard and determined by the local board.

"'That there should be an ultimate appeal within certain limits, from the decision of the board, to the Secretary of State, or to some other public officer or body, to be named in the Act, whose decision should be final.

"'That after the appeal so determined, and after a certain time from the deposit of the plans, the local board should be at full liberty to close streets, enter upon lands, and do all other things necessary for carrying out the scheme, making compensation to the owners and occupiers of lands entered upon for any damage they may do to those lands, to be determined by justices or in a manner to be provided for by the Act; and of course leaving the board and its officers and contractors to their common law liability for any damage resulting from their negligence or improper exercise of their powers.

"'The object of such provisions would be to get the objections to the scheme before it is commenced, and not to leave the scheme subject to continual objections during its progress.

"'We may observe that the powers given to local boards generally are at present more limited than these which are given by the City Act (City of London Sewers Act, 1848. 14 & 15 Vict. c. 91.) There the fullest powers are given to enter on and under all places public or private, doing as respects public places as little damage as may be and making full compensation for all damage wilfully or negligently done; and also making full compensation to the owners of private property.

"'By sec. 53 the amount of damage is in all cases to be determined by justices, and the Act only speaks of a nuisance when empowering the commissioners to select a site for collecting and selling manure.

"'The Metropolitan Management Act (18 & 19 Vict. c. 120), contains somewhat similar provisions, and gives full power to close the whole or parts of streets, and consequently these Acts afford precedents as far as they go for such an alteration in the law as we have suggested.'

"I cannot within the compass of a letter enter into details such as I should desire, and, indeed, were it not for the grave importance of the question I should fear I had already trespassed too much upon your time and patience. I trust, however, that the interest you have hitherto evinced in sanitary reform will induce you, at the earliest possible period, to introduce and lend your powerful aid to the passing of a law such as I have referred to, and which shall give to local boards of health ample powers to execute sewerage works, and provide for the comfort and welfare of Her Majesty's subjects in populous places, particularly one's poorer brethren, whose lot it is to dwell in the crowded streets and pestiferous courts and alleys of large towns.

I have the honour to be, &c.

E. J. Hayes, Town Clerk.

The Right Honourable Sir George Grey, Bart.,
Secretary of State for the Home Department."

* "Sewerage.

"Suggestions as to the provisions necessary to be inserted in any general Act of Parliament relative to the above question. (*Sent to the Home Secretary in* 1864.)

"Apart from the necessity which exists for the amendment and consolidation of the existing law relative to public health, local government, and the removal of nuisances in other respects, the following points in connexion with the important question of sewerage are respectfully submitted for consideration:—

"Assuming the present Acts to remain, the following powers should be given:—

"To make a plan of a scheme.

"Full notice of it.

"Power to appeal to local board against it or any part, with an ultimate appeal to the Secretary of State.

"After appeals, and at a certain time from deposit of plan, scheme to be binding upon all parties to be affected by it.

"Power to board to enter upon lands, purchase lands stop streets, &c., to carry scheme into effect, and to cause sewage to pass and flow according to scheme.

"Compensation to be made by board to all persons whose lands shall be entered upon or affected by the carrying out of the scheme, to be settled by justices.

"If the present Acts are to be repealed, a new Act should give all the present and future sewers to the board.

"Should give them full powers to make new ones in similar terms to the city Act.

"It should also give powers to make a scheme similar to the powers above suggested.

"These are mere general notions, and would require elaborating and many ancillary powers to be given.

"The law should compel all objections to be made to a scheme before it is commenced, and if not then made the scheme should be carried out, and no person should have power to stop it.

"Compensation must, of course, be made in respect of lands interfered with, or rights of easement taken away or damaged.

"The board should not be confined to its own district. The protection by appeal to the Secretary of State will be sufficient to prevent the board going out when unnecessary."

2573. (*Mr. Shaw.*) You told us that the kind of mortgage in which the land itself was assigned to the mortgagees as security related to land intended to be used for the utilization of sewage?—Yes.

2574. Do you not think that after that land was so used any court of law would struggle very much against giving the parties any benefit from that mortgage if it was likely that the effect would be to stop the utilization of that sewage; would they not adopt Lord Cairns's doctrine about railway debentures, that public rights must prevail over private rights?—I think not. I think that there is a great distinction. The estate itself would be given in mortgage to the mortgagee as the primary security and the rates would also be given to him as a collateral security. I should give him the estate in order to improve his security.

2575. But it comes to this, does not it, that he could not enforce that mortgage without stopping the whole sewage outlet of that town?—I should not give to the mortgagee the power of sale of that estate in the ordinary mode. It should be a very special power of sale if you gave him the power of sale at all, but a power of leasing would be the better mode, so that instead of selling the estate he should be able to lease it. The power of leasing is a very usual one in mortgages as well as the power of sale, and the mortgagee would then receive the rent and produce of the land. I may mention an instance where so far from there being a local nuisance from the land, the rent which was 600*l.* a year has been raised; a tenant has been found to pay already, to start with, an increased rent of 150*l.* and the future increase is to be the subject of arbitration at given periods. I think the first will be after two years and the next at the end of three years from the expiration of the two.

2576. So that the mortgagee should be able to let it to any farmer to raise crops from that land subject to the sewage utilization going on?—The *modus operandi* is this: the corporation are the owners of the estate and they let it on lease to a farmer who is not to underlet without their consent. He has taken it

already at an increased rent before receiving the sewage, anticipating the benefit that he will derive from the sewage, and the amount of the increase of rent in the future is to be the subject of arbitration. I propose that in order to pay for the purchase money of that land, which will always be a great benefit and must increase in value, the present generation should not be taxed with the payment of the principal, nor indeed should the next generation; but that the corporation should mortgage the estate paying the interest only, and reserving the right of using the land for sewage purposes.

2577. You mean that the mortgagee should be able to make any profit he could out of it, if he were obliged to resort to this security, subject to its stilll being used for is a no sewage?—Yes; itve mode, but I think it is one which will probably work extremely well; and I have reason to believe that it will be adopted in other towns.

2578. (*Mr Cave.*) Practically the mortgagee gets the rent as a security, does he not?—Yes, and I desire it to be understood that I would give no power that would defeat the object of the purchase, namely, the utilization of the sewage.

2579. (*Chairman.*) Do you find that the system that you have spoken of, as far as regards the utilization of sewage, will be the same in Wolverhampton as is now being tried in Birmingham?—Yes, I believe it is the same. At present it is not in operation in Wolverhampton, but the system, I believe, will be the same.

2580. Can you state the amount of money which has been borrowed for public works in Birmingham and in Wolverhampton?—I cannot now state the amount for Birmingham. The following statement, which I prepared for the Wolverhampton Improvement Bill now before Parliament, and which is scheduled to that bill, shows the financial position of the corporation of Wolverhampton, on 31st August 1868, with respect to incumbrances, sinking fund, and borrowing powers. A sum of 1,200*l.* has been borrowed subsequently.

	£	s.	d.	£	s.	d.
I. Incumbrances.						
1. Borrowed, on mortgage of general district rates, under Improvement Act of 1853, sec. 59 (authorizing borrowing to extent of 50,000*l.*), to pay off mortgages created by the town commissioners under Act of 54 Geo. III., cap. 106	18,600	0	0			
Of which there has been paid off	8,625	0	0			
Leaving due				9,975	0	0
2. Borrowed, under same power, for purchase of market house and market rights. Principal and interest repayable by way of terminable annuities during 30 years	10,500	0	0			
Of which there has been paid off	1,742	12	10			
Leaving due				8,757	7	2
3. Borrowed under same power, to pay off mortgage debts falling due; to part pay market proprietors, and for erection of fat pig market; for part purchase of town hall premises and property adjoining thereto, and to defray cost of covering and improving market hall. Principal and interest repayable by way of terminable annuities during 30 years	20,300	0	0			
Of which there has been paid off	2,917	13	3			
Leaving due				17,382	6	9
4. Borrowed, on mortgage of general district rates, for 10 years, under Public Health and Local Government Acts, at interest at 5 per cent. per annum, to pay for purchase of land to form School Street	1,000	0	0			
The whole of which remains due				1,000	0	0
5. Borrowed, under same power, for like purposes as loan No. 3. Principal and interest repayable by way of terminable annuities during 24 years	13,700	0	0			
Of which there has been paid off	2,939	14	2			
Leaving due				10,760	5	10
6. Borrowed, under same power, to purchase land and premises in Commercial Road for a town wharf. Principal and interest repayable by way of terminable annuities during 30 years	2,000	0	0			
Of which there has been paid off	287	9	3			
Leaving due				1,712	10	9
7. Borrowed, under same power, to pay balance on purchase of town hall premises and Miss Mitton's property. Principal and interest repayable by way of terminable annuities during 28 years	2,907	8	8			
Of which there has been paid off	475	7	9			
Leaving due				2,432	0	11
8. Borrowed, under same power, to purchase land and property to form Skinner Street. Principal and interest repayable by way of terminable annuities during 30 years	1,550	0	0			
Of which there has been paid off	158	13	9			
Leaving due				1,391	6	3
9. Borrowed, under same power, for works of sewerage. Principal and interest repayable by way of terminable annuities during 30 years	37,000	0	0			
The whole of which remains due				37,000	0	0
10. Borrowed, under same power, for like purposes. Principal and interest payable in like manner	3,000	0	0			
The whole of which remains due				3,000	0	0
II. Sinking Fund.						
Sinking fund created under Local Government Act, 1858, for redemption of mortgage No. 4 and remaining unapplied				197	6	11
III. Borrowing Powers.						
1. Under Improvement Act of 1853, sec. 59, power to borrow for purchase of markets, &c., and for any purposes of that Act, on general district fund and rates	50,000	0	0			
Borrowed (mortgages Nos. 1, 2, and 3)	49,400	0	0			
Repaid	13,285	6	1			
Balance of loans due	36,114	13	11			
Unexhausted borrowing power under Improvement Act				13,885	6	1
2. Under Local Government Act, 1858, sec. 57, power to borrow for purposes of that or any incorporated Act, amount not exceeding assessable value for one year of premises assessable within borough, which, on 31st August 1868, was	190,555	0	0			
Borrowed (mortgages Nos. 4, 5, 6, 7, 8, 9, and 10)	61,157	8	8			
Repaid	3,861	4	11			
Balance of loans due	57,296	3	9			
Unexhausted borrowing power under sec. 57 of Local Government Act, 1858				133,258	16	3
3. Under Local Government Act, 1858, sec. 78, extended power to borrow for works of sewerage and water supply, on general district fund and rates, amount not exceeding two years assessable value, which, on 31st August 1868, was	381,110	0	0			
Unexhausted borrowing power, under sec. 78, of Local Government Act, 1858; no money having been raised under this power				381,110	0	0

E. J. Hayes, Esq.

7 June 1869.

(B.) Position of corporation under Municipal Corporation Acts, on 31st day of August 1868, with respect to incumbrances, &c.

	£	s.	d.	£	s.	d.
Borrowed on mortgage of borough fund and rates, under Municipal Corporation Mortgages, &c., Act, 1860 (authorizing borrowing with consent of Commissioners of Treasury, to extent not limited), for purchase of Higgs' property for town hall; principal and interest at 5 per cent., repayable by way of terminable annuities during 30 years - -	3,800	0	0			
The whole remains due - - - - - - - - - -				3,800	0	0

The witness withdrew.

W. S. Daglish, Esq.

(15.) WILLIAM STEPHEN DAGLISH, Esq., examined.

2581. (*Chairman.*) You are clerk, are you not, to four local boards of health?—I am.

2582. And especially you wish to give the Commission some information with reference to the neighbourhood of Newcastle-upon-Tyne?—The local boards to which I am clerk are boards which are gradually proceeding from agricultural boards to becoming small towns. The local boards that I am clerk for are a number of local boards adjoining the river Tyne, on the north and south side. On the north side the Walker township district local board, which abuts upon the municipal borough of Newcastle; the next the Wallsend local board; the next the Willington Quay district local board, which abuts upon the municipal borough of Tynemouth; on the south side I am clerk to the Jarrow district local board, which abuts upon the borough of South Shields, and there is a local board for which I am not clerk, called the Felling district local board, which abuts on the municipal borough of Gateshead. In the three municipal boroughs which I have referred to, Newcastle, Tynemouth, and Gateshead, they all have private Improvement Acts specially passed by the House, in which provision is made that the first cost of sewering, paving, flagging, and channelling the streets, shall be in all cases paid by the owners of the property which abut upon the street, whether it be a highway or not a highway, according to the respective frontages of the property.* But unfortunately in the 69th section of the Public Health Act, 1848, under which all those local boards are worked, there is a provision that the first cost of sewering, &c., shall be paid in cases where the street is a highway out of the general district rates, the consequence of which is this, that whereas roads run directly through those municipal boroughs and through the rural districts which I have mentioned where the road leaves the borough, the first cost of paving, flagging, and channelling falls, as soon as it comes into the district of the local board, upon the general district rates, and not as ought to be in all cases of private improvement upon the property itself and its owner. This case arises very strongly in the board of Walker, which adjoins Newcastle, in which on one side of the road there may be a person having a house who is compelled if in the borough to pay for his own sewer, &c., at his own cost, whereas his next door neighboor who is in the local board district, inasmuch as it abuts upon the highway, compels the board generally to do that which ought to fall upon his individual property. This is peculiarly obnoxious to districts like those which I represent, as they are covered with ways which formerly were roads for coal to be taken down to the staiths or shipping places in the river, and which have now ceased to be actually roads for those purposes, but still they remain public highways. The whole district is also intersected with public highways, and the effect of this provision in the 69th section of the Public Health Act is absolutely to paralyze a large amount of improvement in those districts. I can state from personal knowledge that at this moment thousands of pounds are waiting the decision of this question; and inasmuch as in one particular board the great majority of the new houses will probably be made to abut upon the highway if the present law stands that those are to be paid out of the general district rate, the improvements will not be done. To remedy this a very influential deputation from those local boards which I represent waited some time ago upon Mr. Bruce, who was then the Under Secretary of State. Mr. Bruce carefully considered the question, having the plan before him which I now have in my hand, and he intimated to us that he saw the necessity of some change, and would introduce a measure by which equality should be preserved in all those cases, that is to say, that the first cost of those improvements should be borne by the owners of the property on the same system, whether the street was a highway or not a highway; but since coming to town I have received an intimation that owing to the action of this Commission that bill will not be proceeded with, and I am very sorry to hear it, because I am quite sure that until this question is settled, in at least two of the local boards which I represent, improvements of this description, sewerage, paving, flagging, and channelling, will absolutely cease upon any roads which are in reality or with regard to which there may be set up the pretence that they are public highways. I would particularly point out that so necessary is this that every one of the corporate bodies which I have mentioned have by a special section in their private Improvement Acts obtained those very powers, and in one case I believe the corporation went to Parliament chiefly for the purpose of obtaining such powers. If then such powers are so valuable for corporations, no reason can exist why those small local board corporations which adjoin them, and which are every day becoming more extensive, should not possess the same power.

2583. The provision which you have suggested you think ought to form part of any consolidated Act for local government?—Yes, certainly; the best provision which I have seen is in the Gateshead Improvement Act, which simply says in four lines that all improvements may be carried out at the expense of the owner of the property, whether the street is a highway or not a highway; but I think by simply striking out the words "not being a highway," in the 69th section of the Public Health Act, 1848, that Act would quite meet my views.

2584. Are you aware of other cases where villages having suddenly become towns, and the highways therefore converted into streets, the same difficulty has occurred?—In every one of those four cases with which I am connected it arose. In the case of Jarrow it has sprung up to 20,000 inhabitants from a very small number. I am speaking of within 15 years.

2585. Can you state about the amount of the population of the Tyneside local boards with which you are connected?—Of the boards to which I am clerk I should think it would be 50,000.

2586. What is the rateable value of that area?—About 80,000*l.*

2587. The villages in this case which have gradually

* The following are the sections in the three Improvement Acts of the Municipal Boroughs:—

28 & 29 Vict. cap. ccl. The Newcastle-upon-Tyne Improvement Act, 1865.—Sect. 24. If at any time any street or court formed, set out, or laid out either before or after the commencement of this Act is not sewered, drained, levelled, flagged, and paved or macadamized to the satisfaction of the corporation, they may at any time and from time to time order that it be freed from obstruction, sewered, drained, levelled, flagged, and paved, macadamized, and otherwise completed, with such materials, at such levels, with such inclinations, and with sewers and drains of such dimensions, and that the soil thereof be raised, lowered, or altered in such manner and within such time as the order directs; and thereupon the respective owners of the buildings and lands in such street or court shall, at their own respective expense, remove all obstructions in, upon, or under, and sewer, drain, level, flag, pave, macadamize, and otherwise complete such street or court within the time and in the manner prescribed in the order.

29 & 30 Vict. The Tynemouth Improvement Act, 1866.—Sect. 24. From and after the passing of this Act the powers given to the local board by sections sixty-nine of "The Public Health Act, 1848," and of section thirty-eight of "The Local Government Act, 1858," to compel the sewering, levelling, paving, flagging, and channelling, and the metalling of streets not being highways, may from time to time be exercised by the local board in respect of any highways or parts of highways in the borough which have not under those sections or any of them been at any time sewered, levelled, paved, flagged, channelled, and metalled by or at the expense of the owners or occupiers of the premises fronting, adjoining, or abutting thereon.

30 Vict. The Gateshead Improvement Act, 1867.—Sect. 36. The powers of the local board under the Public Health Acts for compelling the improvement of streets, not being highways, may from time to time be exercised by the local board with respect to highways and parts of highways which have not at any time been so improved by or at the expense of the owners or occupiers of the premises fronting or adjoining thereto or abutting thereon.

grown up into towns I presume are differently situated as to their provision for local government one from the other; some have and some have not local Acts?—Some have obtained the provisions of the Public Health Act at different periods, which of course increased the difficulty, and the difficulty is increasing every day which I refer to.

2588. Is there any other point which you wish to bring before the notice of the Commission?—Except in connexion with this question that we feel a great difficulty in altering or diverting any public highway within the district of our local board, the expense of going to the sessions, and the delays of a very serious kind, and if any provision could be given to us the same as is now possessed by the court of quarter sessions as to altering or diverting a public highway, not with the view probably of absolutely diverting any necessary road, but with the view of being able to cut off a certain corner of a road, which we cannot do at present, or with a view to straighten a road, so that any powers of alteration and deviation of public highways at present possessed by the quarter sessions should be vested in the local authorities, it would be very desirable.

2589. Do you mean that it should be possessed by one local board or by the aggregate local boards?—By each local board within its own district.

2590. What is the greatest amount of rates that you have known levied on the rateable value of the district for waterworks?—The highest I have known is 2*s.* in the pound per annum, and the lowest 1*s.* in the pound per annum. In one board we work at 1*s.* in the pound per annum, and in another board we work at 2*s.* in the pound per annum.

2591. What has been the poor-rate besides that?—The poor-rates vary in different parishes. Each local board follows the rating of the poor of the district in which it is situated. I have not the poor-law statistics.

2592. (*Mr. Powell.*) You have spoken about a highway, and you stated, did you not, that a private owner ought to pave that highway at his own cost?—Yes, the first cost.

2593. Is he alone to use this road which he has to pave?—As soon as he has made it, it then becomes a public highway for the use of the public, and then the future cost of maintenance is borne by the general district rate.

2594. But in the first instance the owner has no control over the width, has he?—He must make the street according to the width prescribed in the byelaws.

2595. You are contemplating, are you not, a highway which is already made?—No, that does not make the owner pay. Any right of footpath over which the public would go would give an exemption, and throw it upon the general district rates, and not upon the owner. It does not mean a turnpike or even a horse-path; and a footpath would give the same exemption. *W. S. Daglish, Esq.* 7 June 1869.

2596. Confining your answer for a moment to that point to which, I presume, your attention was chiefly directed, that is, roads used for carriages, a private owner would obviously have no control over the width?—My attention, mainly and chiefly, has been directed to the difficulties which have arisen in the case of footpaths not carriage paths; but the argument would be the same in the case of a carriage path, the owner would have no control over the proposed width.

2597. Then, seeing that this road which you speak of is to be used by the public, and not by the private individual only, it is obvious, is it not, that the paving must be of a more expensive character than the wants of a private individual alone would demand?—Undoubtedly, I quite admit that; but the same thing would apply to a street not being a highway. Every owner of property is always of opinion that the cost incurred by the local board in those works is too great an expense.

2598. Do you think it is a just thing to saddle a private individual in the way you suggest with this difference between what would serve his purpose and what would be required by the public, seeing that it is a public highway, and ought to be made strong enough and durable enough to bear constant use by the public?—I think it is; the private property has increased benefits, inasmuch as its being a highway the property probably is of more value by abutting upon the highway. I think the benefit in the one instance would meet the loss in the other.

2599. Of course in your district you have very heavy traffic with your vast population and the nature of your industry?—The traffic is heavy close to the centres of industry, but the chief traffic is not upon those streets which we would call highways. The chief traffic is upon those streets which being entirely new streets have been entirely paved at the cost of the owners. The chief traffic does not in any case that I know of follow as a rule the highway, because the ancient highways were not near where the centres of industry now are.

2600. (*Mr. Cave.*) By highway do you mean a street?—No; by highway I mean any road or way, whether horse or foot or carriage, over which the public by time and use have acquired a right.

2601. (*Earl of Romney.*) You mean what the Act of Parliament calls a highway, whether it be a footway or a carriageway?—Yes.

2602. (*Mr. Cave.*) Do you mean in the country or in a town?—Peculiarly in the country; it is the country that I am referring to where those difficulties arise.

The witness withdrew.

Adjourned to Thursday next at 12 o'clock.

Thursday, 10th June 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, ESQ., M.P., IN THE CHAIR.

The EARL of ROMNEY.
The EARL of DUCIE.
The Right Hon. STEPHEN CAVE, Esq., M.P.
Sir THOMAS WATSON, Bart., M.D., F.R.S.
Lieut.-Colonel EWART, C.B., R.E.
JOHN TOMLINSON HIBBERT, Esq., M.P.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
HENRY WENTWORTH ACLAND, M.D., F.R.S.
JOHN LAMBERT, Esq.
FRANCIS THOMAS BIRCHAM, Esq.

(16.) ROBERT ROBINSON CARR, Esq., examined. *R. R. Carr Esq.* 10 June 1869

2603. (*Chairman.*) You are clerk to the Sanitary Committee of the Town Council of Newcastle-upon-Tyne?—I am.

2604. What is the local governing body of Newcastle in sanitary matters?—The mayor, aldermen, and burgesses of the borough, under the Municipal Act, acting by their committee.

2605. Is there a local Act for Newcastle, or is Newcastle under the General Local Government Act?—It is regulated under its own local Acts.

2606. Has it not adopted the general Acts in any particular?—In so far as they have been adapted by the general law of the land and applied to municipalities where the law has been general, they have then

R. R. Carr, Esq.
June 1869.

taken action under them, but they have not taken any action to apply the Acts to Newcastle, but relied upon their own powers.

2607. What parts of any public Sanitary Acts apply to Newcastle?—The Sanitary Act of 1866, as amended in 1868, the Nuisance Removal Act, the Workshops Regulation Act, the Bakehouses Regulation Act, the Common Lodging Houses Acts, the Diseases Prevention Act, the Sewage Utilization Acts, the Baths and Wash-houses Act, the Acts regulating Burial Grounds, the Labouring Classes Dwellings Acts, the Public Health Acts, the Consolidation Clauses Acts, and some others.

2608. Upon other points Newcastle is governed, is it not, by its own special Acts?—It is.

2609. How many such Acts are there?—The first Act of the new corporation was passed in the year 1837, which repealed the statutes of the Georges' reigns. That Act was amended in the year 1841. In the year 1846 a subsequent Act was passed, and in 1850, in 1853, in 1855, and in the year 1865 other Acts were passed.

2610. When you talk of the new corporation what date are you referring to?—The year 1835, or rather commencing in 1836, when the Municipal Act was applied to the governing body of Newcastle-upon-Tyne, repealing their charters for local government.

2611. What is the population of the town now?—It is estimated by the Registrar General at 130,000, that is for the statistical purposes of the Government offices. According to the Census of 1861, the population was 109,000, and it would appear if it is advisable to make a distinction in the population between the old town proper and the five outlying townships which were added to the jurisdiction of the corporation in recent years, the old town population in 1861 was 61,000, and in the five outlying townships 46,000. In the year 1851 the figures stood thus,—in the old town the population was 57,000, and in the townships 29,000; that was very shortly before the sanitary provisions were applied to those townships.

2612. Were those townships not within the borough?—Not within the ancient borough.

2613. Are those townships within the borough at the present time?—Yes, they now are, and since the year 1853 the corporation have acted as the sanitary authority of those five outlying townships.

2614. What happened in 1853?—The corporation were made surveyors of highways in those outlying townships and obtained extensive jurisdiction over sanitary matters in those townships.

2615. What is the area of the town, and what is the area of the outlying townships added to it?—The entire area at present within the corporation jurisdiction is 5,325 acres 2 roods and 28 perches, of which 3,460 acres 2 roods and 38 perches belong to the outlying townships, and the old borough, comprising the four parishes extends to 1,864 acres 3 roods and 30 perches. The parishes applied as well to the old town within the walls as the district beyond the walls, but within the liberties of the town, a distinction owing to the circumstance that its original area was enclosed by a wall which comprised half a mile square in extent, the consequence was that that half mile was very closely packed against the river side property.

2616. Is there any part of the outlying townships which may be called agricultural, and not built upon?—A considerable portion.

2617. What is the rateable value of the town within the walls, and the rateable value of the outlying townships?—I have tabulated these statistics at contrast dates and the increase in the new town, both as regards population and value is most marked.

Parishes and Townships.	(*a*) Acreage.			(*b*) Population.				(*c*) Rateable Value.	
	A.	R.	P.	1831.	1841.	1851.	1861.	1853–4.	1868–9.

The parliamentary borough (comprising the Newcastle poor law union)	-	-	-	-	-	-	109,000		
							Estimated in 1869 by Registrar-General at— 130,503		

2618. Can you give us also the amount of rates which have been levied upon those two districts during the last two or three years for Local Government purposes?—The rates levied since 1865 throughout the borough are a general rate and improvement rate, the income from which has been about 87,000*l.* for the last two years, viz.:—

	1866·7	1867·8	Total 2 years.
Parishes or old borough	27,201	30,191	57,392
Townships or new town	13,975	16,328	30,303
	41,176	46,519	87,695

2619. What is the greatest amount of rates in any year that you recollect to have been levied in the pound on the rateable value for local government purposes?—For municipal purposes, a general rate of 2*s.* is the maximum amount, which is at present levied, and there is 7*d.* as an improvement rate.

2620. Under what Act is the latter levied?—That is under the Act of 1865.

2621. Are there any difficulties peculiar to the low town or water side property?—Yes; the low town is built against the hill banks of the Tyne, and traverses from the water side by narrow "chares" or lanes which the rising ground blocks up, and the ascent to the higher town is by steps or very steep banks. I may refer to the three principal banks, the Pandon Bank,

the Dean Street Bank, and the Forth Bank. I wish to show that the difficulty of the local government has been mostly with this very closely built property within the confined area.

2622. What you call the central town is more modern in building, and probably in a better sanitary condition?—Yes; opened out by the railway system and private improvements, and Mr. Grainger's streets.

2623. And the outlying township still more so?—I cannot say that; there has been such an accumulation of unfinished streets in the new town.

2624. What independent authorities are there in relation to those three different distinctions of property; is the town council the authority for them all?—For the whole of them at present, including the outlying townships.

2625. Are there no separate jurisdictions over the whole of this area?—Not at the present time.

2626. Were there formerly?—Yes.

2627. When were they combined?—In the year 1853 the corporation jurisdiction applied to the whole of the municipal borough, but before that time, from the year 1835, the townships acted independently for sanitary purposes and street arrangements.

2628. How is this area divided for poor law purposes; is it all one union?—It is all one union, but the union includes two outlying townships in addition to the municipal borough; and those two townships with the municipal borough constitute the parliamentary borough.

2629. Then in local government functions, including nuisance removal, have the board of guardians any conflicting authority with the town council?—Not within the municipal borough. In addition to that they have a jurisdiction in the outlying townships of Fenham and Benwell.

2630. In the outlying townships, for the purposes of nuisance removal, there are practically two sets of authorities acting side by side?—Yes, within the union district there are, but within the municipal corporation that is not so.

2631. (*Earl of Romney.*) In those other two townships where the board of guardians have authority the municipal authority have none?—The municipal authority have none.

2632. (*Chairman.*) Would the last Sanitary Acts of 1866 and 1868 constitute the council the sanitary authority as construed with your local Act of 1853?—Yes, within the townships and the old town.

2633. Does the Secretary of State in any way interfere with your local government?—Yes, by advice.

2634. Has he done so upon any occasion?—He has. We have had communications from the Secretary of State through the Home Office.

2635. Can you describe any particular instance which will show the Commission the mode in which they have given you advice upon any point?—They have advised us of the prevalence and approach of any epidemic on the continent and in the country, and they have given suggestions so that we might be fully armed to meet such things.

2636. But they have never interfered with your local government?—They have had jurisdiction under the Sanitary Act. When regulations were framed under the Sanitary Act, we had to have the direct approval of the Secretary of State to those regulations under the Nuisance Act of 1866, and with regard to the byelaws of the borough under the local Act of 1865; of course we require the approval of the Secretary of State to those regulations.

2637. What appeal would any person have in case of a grievance under any of your local government functions?—They could go to the Quarter Sessions. Newcastle has a sessions of its own; it is a town and county of itself.

2638. Is there any appeal provided in your local Acts?—There is an appeal by the most recent Act of 1865. The general magisterial law would of course apply to the proceedings of the bench as a bench of magistrates.

2639. Is there generally any conflict of authorities in any of your local government matters in Newcastle?—I am not aware of any. I cannot refer to anything but where the authorities have acted with great unanimity, both the municipal authorities and the board of guardians.

2640. When you say that the authorities have acted with unanimity what authorities do you mean?—The corporation, the board of guardians, and Her Majesty's Customs as having jurisdiction over the port of the Tyne. I may refer to the cattle plague, in which the board of Customs and the corporation have been quite at one in their administration of the law; and in quarantine regulations, on the approach of cholera to the coast, the corporation have been in close contact as regards advice in applying the law.

2641. What is the authority in Newcastle relative to quarantine matters on ships arriving with infectious disorders on board?—Stretching from the mouth of the Tyne to Newcastle there are two independent authorities at the extreme mouth of the river, viz. Tynemouth and South Shields, and then between those two extreme authorities and Newcastle we have the intermediate local boards of Jarrow, Wallsend, Howdon, Walker, the county authorities of Durham, the county authorities of Northumberland, the Newcastle guardians; the Gateshead guardians, and the borough of Gateshead, all having independent jurisdiction, inasmuch as their jurisdiction extends to the water between the port of Shields, which is the eastern boundary, and the port of Newcastle, which is the jurisdiction of Newcastle.

2642. Do those great number of authorities never come into conflict with each other?—They act in this way,—where their interests are common they approach each other by communication, and they have joint meetings when necessity suggests, but according to the existing law they have not general authority over the entire district, and any arrangements which they make common must be by consent; arrangements within their own jurisdiction they can absolutely make, but any common action must be taken by consent after arrangement and discussion. On the approach of the last cholera, the town clerk of one of the eastern authorities wrote to his colleagues in office suggesting such concerted action with the view to having hospital accommodation on the approach of the cholera, should it so come.

2643. If they either came into conflict or did not take action at all would the Privy Council have power to compel them to act?—Yes.

2644. Has there been any instance in which the Privy Council has had to interfere?—The Privy Council, under the Quarantine Act, issued an order applying to the Tyne in the year 1866. They applied the Act to the port, reciting that there was cholera on the continent, and giving to each of those authorities jurisdiction within their several areas for the purposes defined by Parliament in the health laws.

2645. How have your local authority acted generally with respect to town improvements, widening of streets, or public works generally?—Up to 1853 their operations were confined to the old jurisdiction, the borough proper comprising four parishes as well as the internal walls; and within the period from 1835 to 1853 they acted with Mr. Richard Grainger and the local board, who remodelled the central part of the town; and of their own independent action they have considerably improved the low town by removing the chares and the block property near to the water side from the quay to open out the approaches to the river. They widened some of the narrow streets, the Close particularly, and they demolished house property in Sandgate to a considerable extent, which was a very close district at one time; and after 1853 they obtained extended powers over the outlying streets in the townships of Westgate, Elswick, Jesmond, Heaton, and Byker, with a view to making unfinished streets which had been formed in those outlying districts at the expense of the owners of property in those streets.

2646. Has it been found that the limit which I

R. Carr, Esq.

June 1869.

understood you to say was imposed by the local Act of 1865 to 2*s.* in the pound has been an undue restriction upon necessary improvements?—It has not been found so.

2647. You think that they are going on as fast as they properly could, in fact, if there were no such limit imposed upon them?—Yes; for this reason, that we have as a supplementary rate, power to levy an improvement rate of 1*s.*, but we are 5*d.* from the maximum yet, for it is levied at 7*d.* only at present.

2648. In what way generally is the rate levied upon the inhabitants for public improvements? Who is charged?—The occupier; and since the year 1865 the owner is bound to pay one fourth of the levy from time to time, the tenant having authority to deduct that amount from his rent. In the year 1865 several of the municipal rates were consolidated into one general rate, there having previously been a watch rate, a lighting rate, a sewers rate, a paving and flagging rate, and a separate rate for each of the townships, and an improvement rate, and a new streets rate. All those rates were done away with in the year 1865, and merged into two rates, the general rate of 2*s.* for the purposes of the entire borough with the improvement rate of 1*s.* for street improvement; and after meeting those requirements, paying off the borrowed money and interest, any surplus of the improvement rate is available for the general purposes at the discretion of the corporation.

2649. Can you give us the rate of mortality in Newcastle?—Last week it was 22 deaths per 1,000. Since the year 1866 the corporation have made arrangements with the different registrars of the districts, who give fortnightly duplicate returns of what they send to the Registrar General in London, and those are tabulated according to the localities, and handed from time to time to the sanitary officers.

2650. How many per 1,000 have died in Newcastle per year during the last three years?—Last year the death-rate was 25·5 per 1,000.

2651. That is rather excessive, is it not, compared with other towns?—It is excessive, but it has gradually improved since the fever epidemic in 1866. I produce a table contrasting the death-rate of Newcastle with the eleven English towns included in the weekly issue of the Registrar General, showing that in the year ending 1868 we were 1·3 below 26·8 the average:—

Manchester	31·7
Salford	31·5
Leeds	29·5
Liverpool	29·0
Bradford	28·1
Sheffield	25·5
Newcastle	25·5
Hull	25·2
London	23·8
Birmingham	23·3
Bristol	22·0
Average 11 towns	26·8

2652. Can you tell us whether that excessive mortality applies to the low town particularly?—Yes; as regards the confined areas I should say peculiarly so.

2653. Can you state that in any particular places where the public works you have talked of have been carried on during the last 10 or 15 years the mortality has been reduced by such improvements?—I should most certainly say so; but as a means of comparison, without stating that sanitary operations are the cause, I submit a return of deaths from certain forms of zymotic disease for the past three years, showing that the total deaths from these causes alone have decreased from 990 in 1866, when fever was epidemic, to 635 in 1868, viz.:—

——	1866.	1867.	1868.	Decrease.
Measles	105	59	38	67
Scarlatina (epidemic in 1866–67)	500	453	274	226
Whooping cough	59	186	48	11
Typhus fever (epidemic in 1866)	203	160	113	90
*Diarrhœa (1868 was an excessively warm summer).	123	141	162	*
Total from these causes	990	999	635	355
Deaths from all causes	3,950	3,889	3,389	561

2654. What is the general state of the sewerage of Newcastle?—It has been considerably improved since the year 1853 over the whole town, there being now upwards of 60 miles of main drains in the town.

2655. Is the whole town made to discharge into any particular reservoir, or what is the nature of the sewerage works?—The main drains all discharge themselves into the Tyne.

2656. Have you ever had any proceedings threatened against you for polluting the river Tyne to such an extent?—Never, to my knowledge. The salt water tide flows beyond the borough twice in the day.

2657. Whereabouts is the discharge below the town, or where does the outfall into the river take place?—There are about seven principal outfalls ranging the entire extent of the town to suit the districts and the declivities.

2658. I suppose that the tide with all the filth keeps oscillating backwards and forwards within the town?—The salt water goes considerably above Newcastle, and the ebb tide carries the filth out to sea.

2659. I mean every time the tide comes in all this filth comes up again?—It may dam back for a time what otherwise would have been carried out to sea by the ebb.

2660. Have you no plan for improving the sewage under discussion?—I have heard our present borough engineer say that he intends to make a general report upon the state of the sewage of the town with a view to intercepting sewers at certain levels where the levels will admit, to catch the high land and to prevent all the sewage getting down to the low level.

2661. And to utilize the sewage in the way of manure?—Intending to bring it before the authorities and see how far it is practicable.

2662. Is there any complaint made in any place of foul effluvia and malaria from this sewage collected together?—I can certainly answer not at Newcastle.

2663. When the cholera raged at Newcastle did it particularly attach to certain localities?—It did.

2664. And whereabouts was it?—It was particularly in the low town, but certain of the high lands were affected as well. One of those townships was not at all affected with cholera; it was quite exempt from the death-rate.

2665. Has not the cholera been always more severe in Newcastle than in any other part of England?—In the year 1853 it was, but on the last visitation Newcastle was not heavily handled.

2666. Has it chiefly kept to the neighbourhood of the river?—Yes, it has; and when I say the neighbourhood of the river I mean the old town, where the property has been very closely packed.

2667. What is your water supply in Newcastle?—It is supplied from Whittledean by a private company.

2668. Do the corporation contract with the company for the supply of the town?—They have a tariff of charges in the Act of the Water Company, which regulates the general supply, and as regards the corporation supply they have a private agreement with the company.

2669. How is the payment made both for the private consumption of water and for the public consumption of water?—The public consumption of water has a uniform charge of 3*d.* per 1,000 gallons, which is paid by the corporation quarterly according to a meter supply, and the private consumption is generally by a meter supply for large manufactories at a tariff

arranged with the corporation, and for the public generally in residences it is at a rental tariff.

2670. The local Act of 1853 you stated was for the purpose of extending the sanitary powers after the visitation of the cholera; what was the principal object of the local Act of 1855?—That Act was consequent on a great fire which took place in the low town.

2671. And it gave you more power for street improvements, did it not?—Yes, for street improvements within the confined district of the old town.

2672. The local Act of 1865 extended the powers of the corporation both with regard to street improvements and sanitary regulations, did it not?—Yes, considerably.

2673. What led to the Act of 1865? that is to say, what defects of power were felt by the corporation which led them to get that Act?—The corporation found that they were without funds to enter more fully into street improvements, and they found that there was a confusion of the rating powers, more particularly with respect to their power over the owners of houses and streets in those townships which had grown up before the corporation got jurisdiction over those townships.

2674. Have the corporation powers over the owners of land to regulate street formations?—They have now very extensive powers. Since the year 1865 to the present time, 128 streets have been completed under these powers, at a cost of 45,000*l.*

2675. Will you state the nature of those powers?—They have the power to fix arbitrarily the description of work in new streets, or streets which have been already formed before they got jurisdiction over them, to estimate the expense, and call upon the owners to pay that estimate to the corporation before they commence the work.

2676. How do those provisions affect the tenants so far as regards rental?—The rental is increased in the new streets where the corporation have applied the powers.

2677. What are the different items of expenditure in your borough under the head of sanitary operations?—The principal items are the daily cleansing of the streets, the emptying of ashpits and privies, and street watering.

2678. Have you an extensive system of ashpits?—Yes, a very extensive system.

2679. When you talk of the sewage of the town flowing into the river you made out rather a worse case than you need. I presume if the ashpit system is extensive in Newcastle the greater part of the sewage is intercepted before it comes into the main drain?—I can give the figures showing the extent of that daily cleansing. In the four and a half years ending February this year the corporation removed 44,000 loads of street sweepings, 30,000 of rakings from the roads, 42,000 loads of scuttle ashes from property where they have no ashpits,—it being closely built property where they have no open convenience for ashpits, but where the corporation remove the refuse daily from the boxes placed outside,—and 172,000 loads from ashpits proper, of which there are 9,940 in the entire borough; and the monthly average of that amounts to 5,358 loads.

2680. Do all the excrements of the whole population go into those ashpits of various kinds?—Where they are connected with privies. In most of the properties the privies are connected with the ashpits, and the ashes are thrown over where there is a connecting communication, and are mixed with the soil, but where waterclosets have been introduced that is not so.

2681. No part of the actual excremental sewage goes into the river except such as may be washed in by the waterclosets?—That is quite so.

2682. Is there any extensive number of waterclosets in Newcastle, or is it confined to the better houses?—It is confined mostly to the better houses, and to the new property which has been built lately. Since the Act of 1866 waterclosets have been considerably increased in number.

2683. Have you a regular system of scavenging?—Yes, we have a regular system of scavenging.

2684. And do you sell the produce?—Not so extensively as might be. The farmers are not educated to use the manure, and it is a drug upon the hands of the corporation.

2685. What is the corporation staff and machinery for cleansing the streets?—I may say that I am quoting from a report of the engineer, who has lately gone into the question, after visiting most large towns in the kingdom, with a view to having a complete system, and the result has been that he advises the corporation to do it through their own staff instead of by contract.

2686. Why?—Because the contract systems from his experience in other towns do not operate well where the population and the area are large; the contractors have shirked their work, and they require so much looking after.

2687. Is the removal of refuse done daily throughout the town?—In the centre parts it is, and in the other districts it is taken at fixed periods and the streets thoroughly cleansed as the requirements may suggest. It is necessary to remove refuse in the centre parts, because they have not facilities for storage on account of the property being so close.

2688. Can you state from your actual returns of mortality that the population have benefited by your scavenging system?—I would not like to make any comparison; there is a marked improvement since the operation of the provisions of the Act of 1866 to the town. Within the past three years the health of the town generally has improved. I believe the average death-rate for 10 years ending 1860 was 27 per 1,000; it was 30·5 in the year 1867, 25·5 in the year 1868, and up to April of this year it is 30 per 1,000; but on looking at the registered causes I find bronchitis alone was the cause of 52 deaths in excess of the same period of 1868, and 70 deaths in excess of the same period were caused by pneumonia and pthisis. We have had much cold and wet in the North during this year. These three causes alone make up 3·6 of the entire death-rate for the quarter. A reference to the tables will show how these results compare since the first application of the local registration both with respect to the districts as compared with each other and the borough as a whole.

2689. Can you say that the decrease of mortality is distinctly connected with the parts of the town where the cleansing has been improved?—I have not analysed the returns sufficiently to answer that question with detail results.

2690. Have the corporation established baths and wash-houses?—They have in three instances, at a cost of 20,000*l.*

2691. Are they generally used by the labouring classes?—In the low town they have been used, but not so extensively as the corporation wished and expected.

2692. Is the Common Lodging House Act carried out efficiently?—Very efficiently.

2693. And do your regulations as to slaughter-houses agree with the provisions of the general Act?—They do.

2694. What is your market accommodation?—It is very extensive. Newcastle is the source of supply for the northern coal fields, and there is a very extensive demand made upon the market produce.

2695. Do the corporation employ inspectors for any purposes either to inspect nuisances or to inspect their markets, or to see to the general health of the town in various ways?—They do.

2696. How many inspectors have they?—They have a market inspector at the general market; they have a market inspector at the cattle market with an assistant, and they have an inspector at the foreign cattle market and a fish market inspector; they have two inspectors of nuisances with two assistants; they have two lodging-house inspectors; they have an in-

R. R. Carr, Esq.

10 June 1869.

spector of provisions, who is assisted by four district men; they have a very complete staff of inspectors, and in those operations they are assisted by the police so far as their observation in the execution of their duties enables them to assist them.

2697. Is your gas supplied to you by a company?—By one private company, who have an Act recently obtained.

2698. What is your burial ground accommodation?—The parochial churchyards were all closed, and the district obtained separate burial ground accommodation; in the aggregate for the four parishes they have 43 acres, besides 18 acres comprised in two general cemeteries.

2699. Do the corporation undertake any hospital regulations either themselves or in connection with the hospitals in the town?—The corporation have provided temporary hospital accommodation in the low town with a view to carry out the requirements of the Act in case of fever epidemics.

2700. What Act do you refer to?—The Sanitary Act of 1866, and in that they have been supplemented by the independent action taken by the board of guardians under the Poor Law. They are at present engaged in building a very large hospital in connection with the Poor Law Administration and independently of both those parties there is a private enterprise, a fever hospital proper, which attends to small-pox and infectious cases under the general medical men of the town.

2701. Do I understand you to say that fever was so chronic in your town that in order to carry out the Sanitary Act the corporation have provided themselves a fever hospital?—A temporary hospital. There was a difficulty in getting a suitable building, but they got an old chapel which was lying empty, and they have fitted it up with very good results. At one time when the fever epidemic was at its height (the fever broke out in the ragged school) some children were removed to that hospital, and 12 were successfully treated without a death; there was no death in the institution.

2702. Is the general hospital accommodation in the town maintained by private subscriptions?—Yes, by private and the corporation subscriptions and a contribution by the board of guardians, who are assessed by the medical officer of the hospital for all pauper patients who are taken to the hospital.

2703. Have you any system of nurses?—There is a system of nurses organized by the committee of the fever hospital.

2704. Is that under any regulations of the corporation?—No.

2705. Did the Sanitary Act of 1866 increase the powers of the corporation with reference to sanitary regulations?—Yes, the corporation by that Act were enabled to go to properties where over-crowding prevailed and they applied a code of regulations to such property.

2706. Have they taken action under such regulations?—Yes, they have.

2707. Can you state any results from those increased powers?—They have obtained a considerable increase in privy and watercloset accommodation for this class of property under that Act, and in several hundred cases they have applied the water supply which that Act gave them the power to compel the owners to attend to; they have registered lodging houses which were not common lodging houses, they have closed rooms in unhealthy districts, and dealt very generally with the smoke nuisance and with nuisances at large, including the provision of branch drains to house property.

2708. Have you completely described in your former answer the organization of your nuisance removal staff?—In addition to the officers which I mentioned the town is divided into sub-districts over which there are foremen or gangers responsible for scavenging and cleansing ashpits, and those men are in daily communication with the inspector of nuisances. Nuisances that are open, that the corporation can remove, the corporation staff daily attend to, and in the case of those that they find the owners of property liable to attend to, they communicate to the inspector of nuisances, who takes magisterial proceedings where necessary. I put in a table showing the actual expense entailed upon the town by cleansing operations of a temporary character, and which must be daily overcome without making advances with permanent works.

(*a*) The Cost from August 1866 to February 1869.	Street Cleansing.	Ashpits.	Street Watering.	Total Cost.
	£	£	£	£
One year to August 1867 -	6,116	5,016	710	11,842
One year to August 1868 -	5,994	4,899	981	11,874
Half year to February 1869 -	2,961	2,417	232	5,610
Total for 2½ years - -	15,071	12,332	1,923	29,326
Average for half year - -	3,014	2,467	384	5,865

* The corporation acquired new powers over ashpit refuse in 1865 which accounts for the sudden and great increase under the head of ashpit cleansing.

2709. Have any difficulties been experienced in the administration of the sanitary law?—Yes, in the new town especially; streets were formed, and as those districts grew up into a town as suburban districts, the streets have been made at the option of private proprietors and vendors of land, the levels were chosen by themselves, and the width of the street and so on, and there has been a difficulty with respect to those streets that already have been completed in districts that had grown up before those powers were conferred.

2710. Have you any suggestions to make for improved legislation in sanitary matters?—Yes. I may first allude to the building regulations, the arrangement of conveniencies, strength of joists, elevations, provisions for preventing fire and the like and the powers over the streets as they are formed and in process of forming, in districts particularly suburban. In the course of time those districts have grown to the town to which they adjoin, and they are gradually growing up in a state of transition, the new authority having to improve them, and take them in their position; in several instances at great cost undoing what has been gradually done, and there seems a necessity for provisions for the districts near to towns not within the jurisdiction of any authority as regards building purposes, the strength of buildings, the levels, and width of streets.

2711. Do you think that the new powers recently obtained are not sufficient upon that point?—Yes, they are not sufficient. I mean districts where no local boards exist, but where the districts will of necessity attach to towns subsequently, and when they are so attached the corporation or the local board will have to undo to a great extent what has been done. That has been the experience of Newcastle in those five outlying townships.

2712. Are there any other suggestions that you wish to make?—With respect to the power to disinfect, the corporation have very fully gone into that. Under the Sanitary Act of 1866 the corporation have provided disinfectants to give the people, they have been advised from time to time where fevers have prevailed, and they have disinfected the premises of those parties, but there is no power given to destroy any class of articles which cannot be disinfected, and we have had difficulties with bedding, for instance, which cannot be safely disinfected except by burning; there is no power to compensate under that Act.

2713. You propose that the public authorities should have power to destroy such things, compensating the owners?—Yes, exercising it discreetly, I think they should have that power.

2714. Have you any other suggestion to make?—Yes, I think that the power to license knackers yards and tripe preparers premises should attach to the same authority as the licenses of slaughter-houses. The knackers yards are licensed by the Court of Quarter Sessions under the old Act of George the Third, and in Newcastle we have no jurisdiction over them, excepting after they are licensed, and as to slaughter-houses there is no power to define in what district the slaughter-houses shall be. There is no prohibitory power for the corporation to say that they shall not be within a certain district of property. The general law provides that slaughter-houses in existence at the time shall be placed on the register, it does not give any power as to subsequent slaughter-houses, excepting that they may be licensed. We have instances at present where slaughter-houses are being placed in the centre of the town. It may be an improper locality, but it is a question whether the authorities have power to prevent them.

2715. Have you power to license them?—Yes.

2716. (*Earl of Romney.*) Then you would have power to refuse a license, would you not?—There would be power to refuse, but it is a question whether it could be sustained on appeal if there were no other reason but the locality.

2717. (*Chairman.*) Are you in your suggestion proposing that the general law should be altered or is it that your local law should be modified?—That the local authority generally should have power to build those slaughter-houses and to define the localities in which they should only be built.

2718. How far does your corporation carry out the Consumption of Smoke Act at Newcastle?—They have to a considerable extent applied the Act of 1853 as amended by the Act of 1866; the Act of 1853 gave the corporation power over smoke nuisances, but the great difficulty that we have is with steam vessels on the river.

2719. Have you any other suggestions to make?—I think that certain building regulations might be defined by the legislature at large; on this subject I have been in conversation with the borough engineer, and he says that in certain instances the option is quite left to the parties, and if the local authority have afterwards to deal with the nuisance arising from it, it entails cost upon the owner of the property and litigation, in many instances, upon the corporation, and he refers to certain trades which might be located as to distance, as to the height of chimney and as to where the boilers should be, and within what distance noisy trades should be from dwelling houses; he says, that, in his opinion, the general law should speak out upon those questions.

2720. Do you agree with him?—I do, and from the experience of the committees I find that the local authorities are quite powerless in many of those matters.

2721. Do you think that those are matters for general legislation rather than for byelaws?—For general legislation, I think, because the byelaws would vary with different towns.

2722. What code of byelaws or what powers of byelaws have your corporation?—They have power under the Act of 1865 to make building byelaws.

2723. Have they carried out their power of making byelaws to any great extent?—They have a code of byelaws which was before the Home Secretary in the year 1866, made under the Act of 1865, upon sanitary matters, street buildings and building clauses generally; but upon those points it is a question how far the law is efficient.

2724. Have the corporation ever been involved in litigation with owners upon such points?—They have; the owners of course have to remedy the defects after the nuisance or inconvenience has been experienced.

2725. What powers should your corporation have to acquire land in case you carry out the system of utilization of sewage upon land?—Perhaps the Sewage Utilization Act of 1865 would be sufficient for that purpose; but as to acquiring land for the deposit of purely towns' refuse, and for sweepings and ashpits' deposits, we have no power to go beyond the borough at present to acquire any land, and to use it as their depôt.

2726. Do you think it desirable that you should have such powers?—I do think so; the corporation have thought of having some land as their depôt where they could take their refuse from time to time and let the farmers have it in the districts, and educate them to use it.

2727. Do you conceive that there is much confusion in the number of statutes existing upon this subject?—Yes; the general laws applying to towns are very numerous and voluminous. A recent edition of the laws affecting health and sanitary affairs gives the text of 15 Acts relating to health, diseases prevention, nuisances, local government, sewage, and kindred subjects; 12 Acts consolidating provisions as to towns, lands, markets, police, loans, bakehouses, &c.; the Public Health and Local Government Supplemental Acts are 49 in number, while the laws treated by the work are affected by not less than 296 Public General Statutes which the author tabulates in the index as being referred to in the text. No lawyer can grasp these enactments save by great research, much less can a man who has his own business pursuits to look after.

R. R. Carr, Esq.

0 June 1869.

2728. And does that multiplicity of statutes create also a great multiplicity of forms of notices and orders, and various means of carrying them out?—Yes; I brought with me a few of the forms which the law requires our officers to use, and I find that some thousands of forms have to be served in the course of a year by the officers who find nuisances existing, requiring parties to remedy the nuisances; when nuisances are found out, the first step is to give notice with respect to those nuisances being observed, and next to see whether they have been attended to; next to summon in each case; and then the officer has to visit again to see whether the nuisance has been removed, and if not, then the order of the magistrates has to be served, and he has then to go and see whether the magistrate's order has been attended to; those are all cases where there should be no option, but the common nuisance being found, it ought to be removed without any formality or expense to the sanitary body.

2729. Do you think that this question of the multiplicity of Acts prevents people knowing what the law requires?—They do not understand it. They may be anxious to understand it, and to conform to it, but there is great doubt in knowing what is required of them.

2730. Do you think that if the law could be consolidated it would be more efficient, as being better known, and also much more economically carried out?—It would be much more cheaply carried out, and more efficiently. There is great confusion as to the Acts and the application of certain Acts to the authorities.

2731. Has the consolidating of the six local Acts which you have mentioned to us ever been talked of in Newcastle?—It has.

2732. Is that about to be done?—I should say that the next intention of application to Parliament might perhaps lead to that. I would not like to speak for the authorities, but it has been talked of.

2733. Have you considered whether if all the public general Acts on the subject were consolidated, you might dispense with your local Acts, that they might merge in the general provisions for the same purposes?—As regards subjects treated of by the general statutes of the land, I should say yes, but my view, and perhaps the experience of Newcastle justifies it, is that large towns ought to have separate legislation for their own particular requirements.

2734. Taking such general subjects as sewers, gas, drainage, water supply, and the ordinary functions of local government, do you think that a general Act might be framed which would include in its provisions even such large towns as Newcastle?—Yes.

2735. So that a great part of the local government might be provided for under a general Act, leaving only, you think, certain local matters which must still be dealt with by local Acts?—Yes, by large towns.

2736. When you talk of large towns have you any particular limit in your mind as to the sort of sized town you mean?—There are so many towns that are similar in their local circumstances, that I think one could scarcely define a limit arbitrarily. I think that all towns which could really regulate themselves, and where special circumstances seem to require it, ought to have that power.

2737. Are you talking of towns of such a size as would include a great number of towns in the list?—No; I have not a great number in my mind.

2738. Would the exception be in proportion to the population, or from the fact of their being incorporated boroughs?—I should take into consideration as much as possible mixed areas from time to time acquired, the local circumstances of construction or the pursuits of the inhabitants; for instance, a seafaring law would scarcely apply to internal towns.

2739. Do you think that there are many special provisions which must apply only to maritime towns like Newcastle?—I think that there could be regulations for maritime towns, and I think that the Legislature ought to go into the requirements for maritime towns, and define them more clearly than they are at present.

2740. Is the responsibility thrown upon the local authorities as to the storeage of dangerous and explosive products?—That has been thrown upon the corporation of Newcastle by the Petroleum Act and the Gunpowder Act; it is a question whether it ought to attach to the nuisance authority or not, or whether it should be regulated by a distinct enactment of Parliament, considering the interests involved in the trade and the serious consequences for which the local authorities might be made responsible. For instance, in the storeage of petroleum the corporation or local authorities have an option as to the class of regulations they may make for such storeage, and in the instance referred to the corporation have made certain conditions for the licences, but the trade are not satisfied with those conditions, and they seek the Home Office under the powers of the Act to revise the conditions imposed, by which means the matter remains yet in uncertainty and risk.

2741. In case of any dispute as to their obligations in those matters, what mode of arbitration would you adopt?—There are certain matters that could be arranged by a court of arbitration, a common sense court locally acquainted with the circumstances in dispute without having recourse to the law. I have in my mind some instances where we have failed to reach parties by litigation, but where, if there had been the power to bring the two parties together, and there was a dispute between them, it might have been easily arranged. There were some things required, either in the old town which the corporation had allowed to grow up from time to time, or in the new town for which they were not responsible, and this local authority or court with arbitrative powers might have investigated the case and come to a decision which might have been enforced or appealed against.

2742. That is your suggestion, that the law should provide some local board of arbitrament?—Yes; and I think that that would be attended with great good in towns where there are so many interests involved, and where at present you have to inflict a penalty for offences which may be innocently committed, or in ignorance, and where the corporation have certain requirements that the law has not met, they must either go to Parliament at immense expense to redress the evils, or institute legal proceedings at great expense, it may be, only to meet with defeat.

2743. Do you think that legal expenses might be reduced by a more easy process?—I do. I have seen that in Newcastle particularly within my time. If an improvement is required, I will take the great explosion in 1854, when the town was laid quite waste by a fire, the corporation had to come to Parliament and schedule the properties which they wished to buy, and of course the Lands Clauses Consolidation Act and the general law of the land was applied with respect to the mode of purchase, a very expensive machinery indeed; whereas if the corporation had possessed an opportunity of obtaining a loan wherewith to pay for the purchase of the property without letting people know by depositing books of reference and showing to Parliament that they require this property, it would have been much more economical, because the present practice opens the door to so much cost in the long run.

2744. (*Mr. Powell.*) I see that there was an old borough of Newcastle-on-Tyne prior to 1832, and that there were added to it five townships in that year. Then by your local Act, 1853, the corporation acquired power for certain purposes therein described over those five townships as well as over the rest of the borough, and the extension that you refer to was only an extension within the area of the authority of the corporation?—That was so.

2745. (*Earl of Ducie.*) Did I understand you to say that there is a difference in the treatment of knackers yards and slaughter houses by the present sanitary regulations?—I have found it so. The act

of George the Third called The Horse Stealing Act, to put down the practice of horse stealing, required that the justices should grant a licence, and that there should be a registration of the colour of the animals and certain other peculiarities; but the slaughter houses are licensed by a local act.

2746. (*Mr. Hibbert.*) I understood you to say that in one of your rates the owner has to repay the occupier one fourth of the rate. What kind of rate is that?—That is the improvement rate for benefiting the town in the formation of new streets and the general rate for general street purposes, under the municipal law generally.

2747. How long has that been in operation?—Since the year 1865.

2748. Do you know whether the same law is in operation anywhere else?—I do not. We have formerly had it in Newcastle in the proportion of about one fourth of the general rate, but not the improvement rate. We had it one half of the sewers rate and one half the paving and flagging rates, but the other rates and the improvement rate were exclusively tenants rates.

2749. Is this satisfactory to the people of Newcastle?—It acts very well as far as the collection of the rates is concerned; the tenants pay their rates promptly at the municipal office, and arrange the deductions from their landlords when they pay their rent, thus throwing a share of the cost of permanent improvements upon property, and I think properly so.

2750. Have you borrowed large sums of money for improvement purposes?—Yes, from time to time we have; but there is a class of improvements which I have looked financially into at Newcastle, and I have gone very fully into the question. We have no relief from borrowed money with regard to sewerage works and the maintenance of paving and flagging and works of a permanent sanitary character, which is entirely out of the income or the rates in large towns, and I would direct attention to the cost to the town under this head as shown in the following table:—

EXPENDITURE out of Rates and Borough Fund on recent permanent Sanitary Works for which no deferred charge has been fixed upon Posterity.

Period of Charge.	Sewering out of Rate.	Paving and Flagging out of Rate.	Formation of Sewers, Pavement, and Flagging at Cost of Owners of Property.	Streets, Roads, and Lanes, making, repairing, &c.	Upholding the Township Roads.	Total of the foregoing.
	£	£	£	£	£	£

Half-year ending Feb. 1869	1,426	2,560	6,881	1,892	Half-year.	12,759
Total up to February 1869	£64,995	£107,714	£74,303	£262,994	—	£510,006

N.B.—The above expenditure does not include new streets and widenings of streets, made under powers of local Acts of Parliament, nor does it include the accounts for private drains, or other street works, at the optional cost of owners of property.

2751. Have you not carried out those improvements by means of loans?—No, not by loans. I should say that about 65,000*l.* will have been expended in making drains which will be permanently useful to posterity without any charge being fixed on posterity, and the same applies to pavement and flagging, and so on since the year 1853; all those operations have very extensively gone on in both the old town and the new town, and they have been entirely paid out of income.

2752. Have you found any difficulty in obtaining loans?—Under the local Acts we have no power to borrow on the security of those rates. At first the maximum rate was fixed at a low amount, and it was found to be insufficient for the demands made upon it.

2753. Have you really no power to borrow money for any sanitary purposes?—No, we have no power to borrow on the security of the sanitary rates or the general rate; we have power to borrow under the improvement rate, but the improvement rate applies to the formation of new streets and acquiring power to widen our throughfares.

2754. Have you borrowed any money for waterworks?—No, the water supply is in the hands of a private company and the gasworks as well.

2755. What is the amount of the debt which you owe?—

	£
The old bond and other debts and obligations of the former corporation due at the passing of the Municipal Act for which the new corporation became liable	150,000
Loans for street works obtained under the Act of 1837 - - - - - -	70,000
Under that of 1841 a further sum of -	30,000
Under the Act of 1850 for the high level bridge approaches - - - - -	20,000
And for remodelling the site of the great fire and explosion under the 1855 Act -	60,000
Making a total of - -	£330,000

Of these debts and obligations there now remains undischarged a sum of 174,000*l.* The Act of 1865 gave power to borrow 150,000*l.* for new streets, and I believe that it is almost all borrowed.

2756. In what way did you borrow it?—50,000*l.* was borrowed from the Loan Commissioners and the remainder from private parties.

2757. Have you anything to suggest with reference to the mode of borrowing money; how is that money to be paid to the Loan Commissioners?—I think the rate of interest is high.

2758. What is the rate of interest?—Five per cent.

2759. In what mode is it repaid?—It is payable by fixed instalments. We have a clause in the Act that the amount of borrowed money should be annually curtailed by one fortieth part. Lord Redesdale gave us power to have that first loan extinguished in 40 years; that each year one fortieth part of the amount should be paid off.

2760. That is really for a sinking fund, is it not?—No, we have no sinking fund; it amounts to the same thing, but it is preferable to a sinking fund because the per-centage to be received from the sinking fund would be less than we pay the bondholders, one or one and a half per cent.

2761. You said that there were two townships existing outside the municipal borough of Newcastle which were not included, and which were under the board of guardians. In making the authority to carry out sanitary matters what body should you suggest as the best body for carrying them out in places like those two townships?—To a large extent I think that the general Parliament ought to be responsible for those townships. The land is chiefly in outlying districts and comparatively of little value in the early stages of building, and the law should define the width of streets and open spaces

and crofts or fronts, and that would give no option to the vendors.

2762. Who would you make the local authority to see that the proper sanitary provisions were carried out?—I think the town authority, or the public authority nearest to those subordinate districts, because they will ultimately be part of themselves, and they would be in a manner looking after the districts adjoining while they were in growth.

2763. Then you mean that you would put them under the authority of the municipal borough?—Not as regards rating or incorporation until they were sufficiently identified with the town; but I think that they should be left to the general law, with the surveillance of the authority adjoining, because in course of time they will have to incur the responsibility of their management.

2764. Have you any view as to what should be the authority in rural districts?—I cannot say that I have thought it over, and therefore I would not like to express an opinion upon it, but I would submit that rural districts should as well be regulated as regards the width of streets and similar fixed requirements tending alike to sanitary reform and the convenience of the populace by Parliament. Parliament should legislate for the formation of districts as regards certain things where there should be no option. I mean where past experience has pointedly established a state of things to be the best for all.

2765. Do you mean that you would make the same powers to be applicable to rural districts as are applicable to towns?—Not so stringent, nor of such an extreme character, but I think that the country generally should be informed as regards street formation with the consent of the Government of the country; that the Government should take cognizance of the formation of villages as regards certain defined requirements. I may refer on that subject to the General Highway Act. The General Highway Act of course gives the approaches to the town of a certain defined width, but all transverse streets leading to those main arterial roads are formed at present at the option of the owners of the land; they may be defective in level, they may be without drainage, they may be curtailed in width. The law of the land does not, as far as I find, legislate upon that subject, and when those new districts are added to towns the towns take the new districts with those defects, and they have to be brought up and arranged at a wasteful cost.

2766. Are not your views more with regard to districts growing up outside the large towns of the country?—No; I have noticed by casual observation the formation of villages and of large hamlets, and I think that there should be some directory power taking cognizance of those little irregularities, because when the population grows and if they make any improvements they have to do it at great expense, whereas if the law were defined the towns would grow according to their size on defined principles of government and formation.

2767. (*Sir Thomas Watson.*) You have mentioned that the use of ashpits is very extensive in Newcastle. According to your knowledge is the use of those pits effectual in abating or keeping in check the nuisance and noisomeness of the matter for which they are intended?—I think that with a little additional power over the ashpits they would add materially to the comfort of the town, and considerably diminish the expense if the ashpits were covered in and ventilated. There seems to be no power to cover ashpits in. If they were covered in from the sun and the wet, they would be much better.

2768. How often are they emptied?—At present there is no defined time. If a street presents two or three accumulations that are offensive the nuisance staff advises the corporation staff, and the whole of that street is cleaned out at once. We send half a dozen carts, and get half a dozen cart hands, taking away the accumulations from the full ashpits, and also from those that are partially full.

2769. Would the soil again continue to accumulate until some fresh complaint was made of the nuisance?—No; there is a register at the police station by means of which the parties aggrieved by the deposits—I mean by the tenants who make the deposits,—have a daily opportunity of communicating with the sanitary staff as to the removal. Each police station keeps a register of complaints, and those are daily attended to by the corporation sanitary staff; the police inspector at the station records it as an offence.

2770. Has there been any introduction of the earth closet system at Newcastle?—I have heard of its private application in the suburbs by a gentleman connected with the town. They are building a new wing to the prison, and they have made provision for introducing earth-closets to the male wing now in course of erection, but they have not had experience of it there.

2771. (*Dr. Acland.*) Could you give us any reason why you prefer being under a local Act to being under the general Act?—Perhaps I am rather expressing the views of the government of the town, but they think that from local circumstances and local knowledge they acquire information which is useful in the administration by the governing body.

2772. I understand you to say that you lose something of power—for instance, borrowing power—by being under the local Act?—That is so.

2773. Then you would easily remedy those evils, would you not, by putting yourselves under the general Act?—Yes.

2774. Are all the sanitary affairs of the town under the corporation?—Yes; but the guardians act as well in the case of cholera.

2775. Have you a health officer?—There is no health officer, properly so called.

2776. Could you say that you consider such an officer unnecessary?—From the mode in which the health matters in Newcastle are attended to at present I should say that it is a very efficient health administration by the health officers of the Board of Guardians, each of whom is as it were the health officer of his district, who confers with the sanitary authorities within his district, and they are in weekly contact with the Health Committee and furnish returns to them, and in some instances give advice where they find that there is a necessity for action.

2777. Then in fact I understand that you look to the organization of the poor law for a great part of your sanitary administration?—That is so; they are very closely connected through the law of relief to the parties in those low neighbourhoods, because they provide the medical attendants in sickness with the disinfection and the remedial measures that are found necessary; they are very much interwoven, and they could scarcely be disconnected; in fact it is not attempted to disconnect them, for at Newcastle the Board of Guardians and the corporation work as it were as one commission.

2778. So that you do find that the Poor Law Board at this moment provides you with information as to the condition of disease throughout your whole area? We are very much indebted to their machinery for information. As to the register of deaths and their causes, and as to the prevalence of fever in the poor law district, the medical officers keep us advised from time to time, and we have access to their books and the inspector disinfects the localities where there is disease prevalent. We should be quite ignorant of that excepting through a very close connexion with the poor law officials.

2779. The Registrar General's officers, the district registrars, keep the registry of deaths?—Yes; and by arrangement with the head quarters we get it weekly from the five registration officers.

2780. You have a weekly register of disease, have you not?—We have a register of disease.

2781. Do you know whether that is common in great towns?—I believe that it is not common.

2782. Could you tell the Commission in what way the register of disease is kept?—Yes.

2783. Could you hand in a form that you use at Newcastle in the registration of disease?—I can; we

make a classification of disease, as to zymotic, constitutional, local, and other causes of death adopted by the Registrar General, and each death in the borough is classified as to the street and district; and according to that classification the results are tabulated fortnightly, quarterly, and annually, and the districts are compared with each other, and the borough compared from year to year, with itself and other towns; that has been in effect since the year 1866.

2784. Do you print and publish it?—It is for the information of the Public Health Committee and its officers; it is not published.

2785. You spoke, did you not, of the registration of disease as well as of death?—The medical officers tell us how disease is going on in their districts, but the registrar's subordinate officers only give us the deaths, and the locality of the deaths.

2786. But is there not a registration of disease as well as a registration of deaths in Newcastle?—There is a register of disease, but that is in connexion with the Medical Society.

2787. Do they print the returns of disease?—They do.

2788. Could you hand in some of their tables?—I will do so. (See *Appendix*, p. xiv.)

2789. Should you be able to tell the Commission over what area the registration of disease is kept?—Not of my own knowledge; we have no power as a local authority of conferring with private medical practitioners as to the disease within the district; the Medical Society have that power, and I believe it is carried to good account.

2790. You said that the corporation have provided hospital accommodation for fever cases; do I understand that that is done under the provisions of the Sanitary Act of 1866?—Yes, but only to a limited extent; it was as a sort of local reserve for the low town, where the medical practitioners might isolate cases, and in several instances the disease was stamped out by that isolation.

2791. Then you do use such separate clauses of the Sanitary Act as you think fit?—As I understand the Sanitary Act of 1866 applies to all the towns in the kingdom.

2792. Therefore you can use all such clauses of the imperial Acts if you desire to do so?—Yes.

2793. You are not confined to the powers under your local Acts?—No, not at all, and under that Act of 1866 the corporation have set to work very earnestly.

2794. You seem to have carried the system of registration of disease and of intercourse with the Poor Law authorities to a very great extent; may I ask whether you consider that you have power to utilize or to subscribe to the existing civil hospitals to any extent you please?—I consider that the corporation have the power to subscribe to those hospitals out of any surplus income, or their general rates, under the Sanitary Act.

2795. Was there not a discussion at Newcastle as to the relation of the subscription or fever hospital to the general administration of the town by the corporation?—Yes, by a joint committee.

2796. Could you tell the Commission what the nature of that discussion was?—I may explain that the fever hospital of the town is built upon corporation property, with a long lease, and it was in contemplation to extend the area of that hospital. The fever authorities, many of whom are in the council, met the corporation with the view to transferring the hospital to the council, and the result of the interview was that the corporation extended the holding of the hospital to the trustees, by conveying to them the reversion and selling them a piece of ground adjoining on favourable terms, in order to extend the hospital and continue its management under the medical staff of the physicians of the dispensary and of the fever hospital. To this step the Lords of Her Majesty's Treasury, and their surveyor, were assenting parties under the Municipal Act of 1835 regulating the sale of land.

2797. But the point is that the corporation as well as the guardians have the power to provide hospital accommodation for epidemics?—They have the power, and I take it that if the cholera were to break out in Newcastle the guardians would have to provide hospital accommodation and the medical treatment, but if an epidemic of fever fell out those obligations would attach to the executive of the corporation.

2798. If I catch your meaning rightly it is, that in an epidemic of fever one authority would have the management of the town, and in an epidemic of cholera another?—Yes, that is so, as far as I am able to ascertain.

2799. What would be your relation under the Diseases Prevention Act to the Privy Council under those circumstances?—The Privy Council would have all the power over the area of the corporation which the Act of Parliament gives them over the same area if it were administered by the board of guardians, and whatever powers they had in reaching them would reach us.

2800. Have you control over the water supply?—The Sanitary Act of 1866 gives power to provide a water supply, and the water supply of Newcastle is not further under the control of the corporation than it is where the general law of the land applicable to water companies is in force.

2801. Could they take water from the Tyne without your consent?—No, there is a prohibitory clause in the company's private Act to the effect that the corporation should have a veto in certain cases.

2802. You spoke just now of the rural districts, has your attention ever been drawn to the condition of the fishing stations in your neighbourhood?—The corporation own salmon fisheries immediately abreast the town.

2803. I meant specially the large herring fisheries?—Yes, I know the district well, the seaside villages are well known to me.

2804. Such a place for instance as North Sunderland?—Yes, that I know very well.

2805. When part of your population goes at the period of the great fisheries to places of that kind, are they under any kind of sanitary supervision?—I should say there would be the vestry authority within that district.

2806. Do you suppose really that the sanitary law of the country is now such that what I may call summer populations of that kind are efficiently cared for in respect of water or lodging, or do they get into districts where they may be quite unprovided for?—As I observed, with respect to provision in such districts as that, I think that the law of the land is quiet.

2807. And therefore you suggest in connection with what you said just now in answer to some previous questions, that there should be a general sanitary law compulsory in certain particulars over every district?—I would certainly advocate that, because from the experience of Newcastle we have had to pay so very smartly for remodelling outlying districts where they have been left too long to themselves, not to speak of the inconvenience to which the inhabitants are subjected in the interim.

2808. It is the fact, is it not, that in your part of the country dense and considerable populations spring up suddenly without any sanitary provision whatsoever?—Yes, Newcastle has quite outgrown itself.

2809. And then afterwards you have had to remedy evils which might have been prevented?—Yes, which have been allowed to accumulate without any repression.

2810. And which, with reasonable supervision from some central authority, might all have been prevented?—Yes, by distinct enactments, speaking out and saying what should be, I certainly think that the accumulation of evils would be prevented, and mistakes would not be made.

2811. Do you take cognizance of diseased foods in your office of health authority?—We have an inspector of provisions and four assistants; and on that subject I

R. R. Carr, Esq.

10 June 1869.

find that the law of the land is deficient. I do not know that there is any power to treat the milk of a diseased animal, or to deal with animals in the district beyond ours. If they come within our district we can deal with them very summarily; but as to closing the town from surreptitious importation of unhealthy animals for human food the law seems to be deficient.

2812. Have you any public analyst, or any laboratory for such investigations?—We have an analyst who acts for the corporation when his services are required; but he is not appointed with any functions attaching to food. I cannot say that he has been employed as regards food; he has, as regards the gas and water supply, and the strength of inflammable products; he is called into requisition whenever his services are necessary.

2813. You have no power over pharmacists, or chemists or druggists?—We have not. The law speaks out when it thinks that they should be regulated.

2814. Do you inspect the condition of your colliers in the port?—No.

2815. Has your attention been drawn to the health conditions of the Mercantile Marine generally in the Tyne?—Yes, we have opportunities of going on board the vessels, and, if disease should be on them, the Custom authorities or the harbour master, who is an officer of the corporation, communicates with the lodging house inspector, and we have very frequently seamen removed inland for isolation from the remainder of the crew, and treatment for zymotic disease or other illness. The infirmary, for instance, and the fever hospital treat all such cases as are within the jurisdiction of Newcastle, and I know that the operation of those institutions extends to the confines of the port as a port.

2816. But with regard to arrangements conducive to the health of your seamen, have you adequate power over the coasting and other vessels?—I think not; and I think that the ports where passengers and seamen come should be regulated by the law more clearly than they are at present, considering the grave issue at stake.

2817. If you know that any of your coasting vessels are very filthy and in a really dangerous condition from that cause, have you any power as a local authority to require them to whitewash, for instance, or cleanse them?—The Sanitary Act, 1866, applies to nuisances in such vessels. There is a local marine board, but what the functions of the local marine board may be with respect to that I am unable to answer. I know of no authority that the corporation have over those vessels beyond what is referred to.

2818. Has the question of the introduction of the Contagious Diseases Act been discussed by your corporation?—It has been discussed, and it has been before the committee of the corporation that are charged with sanitary matters; and, if I recollect rightly, on looking into the law it was found that certain towns were named in the Act to which only the provisions of the Act could be applied.

2819. They are military and naval stations elucxsively, are they not?—Yes.

2820. Is there any desire to extend the provisions of the Act to Newcastle?—There is a movement being made in the town, and I believe that there has been a town's meeting, in which the medical gentlemen of the town have taken a very active part in order to have those provisions applied. I believe that they have sought the assistance of Parliament by petition to attain that end.

2821. Do you think that that arises from a theoretical opinion that it is desirable, or does it arise from a knowledge of the injury to your population from syphilitic diseases?—I cannot follow you there.

2822. (*Mr. Bircham.*) What is the proportion of houses supplied with waterclosets and those having privies in Newcastle?—The number of waterclosets in Newcastle supplied by the water company in 1865, before the Sanitary Act of 1866 was passed, was 4,039; since that date the nuisance officers have dealt with the owners of property, and there are now 6,251 waterclosets within these two years.

2823. What residuum of houses are supplied with privies?—I cannot state; our record is of the ash-pits for house refuse generally, with which the privies are connected.

2824. When you say that the authorities have brought about waterclosets to the extent of 2,000, under what Act has this been done?—Under the regulations made by virtue of the Sanitary Act of 1866 which gives power to deal with property when those sanitary provisions are found to be defective.

2825. And to force them to bring a water supply where needed?—Yes; and with respect to the supply of water to tenants we have been equally successful. The number of families living in tenement property which had water laid on through the operations of the inspector of nuisances between November 1866 and December 1867 was 914, representing probably 4,570 persons, and those reside in some of the worst parts of the town.

2826. Do you consider the provisions of the Sanitary Act of 1866 sufficient for the purpose of correcting, as far as you desire it, the absence of waterclosets?—I think so. I think that they are very complete, and have been of very great service at Newcastle. Up to that date our powers did not extend to require the construction of waterclosets, but were confined to privies. Perhaps earth closets might be admissible where the localities are suitable, and the clause of the Act extended to meet it.

2827. Have you any small tenements without water?—I should say not at present. There are some localities where the corporation provide a supply by having a public pant in the middle of a property, but the rule should be that property owners should give a water supply to small tenants.

2828. Has the operation of private companies supplying Newcastle with water been generally satisfactory?—Of late years it has been very successful. The daily supply of water to Newcastle and Gateshead, the adjoining borough, is about 6,000,000 gallons, one fourth of which is consumed by manufacturers. They have a storage at present of 530,000,000 gallons, to which they are about to add 600,000,000 more.

2829. Is it a gravitation scheme?—Yes.

2830. Whence is the water drawn?—From Hallindon, North Dean, and Whittledean.

2831. Do you know generally what the expenditure of the water company has been on capital account?—It has been beyond the average of other boroughs, by having to deal with previous water companies. I do not know the amount.

2832. What is the ultimate disposal of the sewage of the town?—It reaches the common drains and goes to the river.

2833. Did I understand you that there was a difficulty in procuring land for the purpose of depositing dry fœcal matter or the dry manure arising in the town?—I can scarcely say that we have experienced any difficulty. There is a large agricultural district in Newcastle, and we have been able by arrangements with the freemen and tenant farmers to get depôts; but if Newcastle had to look beyond its own confines, I do not think it could acquire land beyond its district. The authorities have had it in contemplation to make an outlying depôt for farm produce where the absence of manure would perhaps enable them to sell at better rates.

2834. Would you suggest the necessity of any compulsory power to acquire land for such purposes?—I would. I think that where a borough is confined they should have power to acquire land removed from the population by an inexpensive machinery.

2835. You suggested that in immediate proximity to large towns and also in more distant districts, building regulations in order to anticipate bad building or the improper location of buildings would be desirable?—I certainly think so.

2836. Is it necessary in your judgment that that should be made statute law, or that it might be a byelaw authorized by statute of the local authority?—I would have it defined by a statute where there would be no option; but certain facts ascertained by the government should be applied to different classes of towns, without any option as to the width of streets and improving the sanitary accommodation.

2837. But I understand you that you would carry that into quite rural districts, where at the moment a town was not anticipated, but where a town might grow up?—I think that there could be sufficient discrimination between districts near to large towns which would in the course of time be part of a large system, and purely agricultural districts, which the past history of the country would preclude from ever being large towns, or anything more than big villages, at least for a series of years.

2838. Would not there be a difficulty in fixing that by statute. Would it not be better to leave it to regulation by some local or central authority?—You would then have an opportunity for the local authorities to be indifferent to it.

2839. The registration of disease as distinguished from the registration of death in Newcastle is founded upon private and voluntary sources wholly?—Entirely so, as regards disease.

2840. (*Mr. Powell.*) You stated in answer to a previous question that there should be some discrimination as to the selection of those outlying districts, who would exercise that discrimination according to your view?—The authorities of the town who would subsequently be closely in contact with those outlying districts.

2841. And how would you deal with the matter of representation; you would not give a town authority over a district which was not in any way represented?—Certainly not. I think that they should have a voice.

2842. Have you considered how that might be arranged?—Yes, I think that the requirements of the town with respect to a suburban district should be stated, and that the protest or views of the suburban district might also be stated, and that there should be a judgment between them by a friendly reference, fixed and recognized by the law.

2843. But you would not leave it in the hands of the corporation to exercise this authority—No, not arbitrarily over a district.

2844. Would you leave it in the hands of the Home Secretary to decide?—I think he would be a proper person to decide.

2845. In answer to another question you stated some points with reference to the maritime population as to which you think the Acts ought to be strengthened; are there any other matters on which you have to make any suggestion as showing what extraordinary powers ought to be conferred on the local authority where seaports are concerned?—I think that the comfort of the population in ships, as regards lodging accommodation, because they spend their lives there, ought to be within the jurisdiction of the corporation as far as the owners of vessels are concerned. I do not speak from any facts which I have noticed in vessels, but I think, considering the interests involved, the corporation ought to have jurisdiction as regards their lodging on land. Coming from countries infected with epidemic disease, they incur the risk of endangering the health of the entire country.

2846. Has it ever occurred to you whether it would be feasible or in any way desirable to give the local authorities in towns, where there were a considerable number of emigrants or the like, power to erect houses of refuge for them, where they might be received and attended to with or without some small payment without their being pauperised?—I cannot say that I have noticed that, on account of our not having had much opportunity; we have a house of refuge. I think His Grace the Duke of Northumberland made very extensive provision for that; but I may notice one point as regards emigrants, that we have had smallpox imported at Newcastle, by an emigrant vessel bringing parties passing through the town, we had it introduced into the common lodging houses, which are accessible to seamen ashore.

2847. You made some complaint that the law was not strong enough as to covering privies and the like, I presume that your answer referred to your local Act alone and had no reference to the provisions of the public health Act upon that subject?—Quite so, it is a laches on the part of the byelaw, I think that we ought to cover ash pits and privies by a byelaw; but middens to houses in the country should be under some regulation as well, especially when near public roadways.

2848. Will you state shortly the arrangements at Gateshead as to the discharge of sewage into the river?—In general terms I believe it is the same as at Newcastle; it is by arterial drainage.

2849. Are there not further improvements contemplated at Newcastle which are designed chiefly from mercantile considerations, but which will, if carried out, effect important sanitary reforms in certain districts?—Yes, particularly the deep water quay scheme, which will open out the waterside property.

2850. (*Mr. Cave.*) I think you stated that there was no harbour authority generally on the Tyne?—In sanitary matters no; there is, however, a conservancy commission for river objects.

2851. Supposing there was an outbreak of epidemic, cholera for instance, on board ships in the port of Newcastle, what would be the course of the local authorities?—I presume it would be the authority where the vessel was lying athwart. Whatever shore was nearest to the vessel the authority of that place would be the authority, but it might happen that the vessel was midway down the river opposite to an agricultural shore, where there would be a difficulty in finding any authority responsible.

2852. You are aware, are you not, that in case of water opposite an agricultural shore the justices have the same authority as they would have on the shore?—Yes. I referred to the justices of counties where there were no towns with jurisdictions, and to the increased number of authorities in our immediate port.

2853. We will confine ourselves to the port of Newcastle, and to that part which is recognized to be within your port; what would be the course of the local authorities in case of an outbreak of disease among the shipping?—I can state what course we did pursue when cholera was threatened. The then local authority issued a notice calling attention to certain provisions which they had made in naming medical officers who would treat any disease of the character you refer to, and they placed themselves in communication with the customs authorities to know whether there was any necessity for their surveillance, and they also placed themselves in communication with the Poor Law guardians, who had a medical staff, in order that the whole of those three authorities might act in concert, the Customs authority, the Poor Law authority, and the corporation authority, and the corporation named medical gentlemen in certain districts which were conveniently situated where advice could be had, and where they might have an opportunity of treating any case that was presented; the same course was pursued by the Trinity House who appointed medical officers to attend to the sailors and waterside population of the entire river.

2854. What was their next proceeding?—Very fortunately there was no occasion for further proceeding, the disease disappeared.

2855. Do you know whether they would have power for enforcing arrangements to prevent an outbreak of cholera, such as stationing vessels in particular parts or preventing refuse being thrown into particular parts of the port; is there any power to make such regulations?—The conservancy board have power over deposits in the port, the corpora-

R. R. Carr, Esq.

9 June 1869.

tion of Newcastle has none, and as to the position of vessels I think the quarantine law is the only power at present.

2856. The quarantine law has to be put in force, has it not, by application to the Privy Council?—It is so, and an order is issued by the Privy Council.

2857. The conservancy board have power over deposits in the river; but is not that with regard to preventing obstructions to the navigation rather than for sanitary purposes?—Yes.

2858. Would the conservancy board pay any attention to an application made to them on sanitary grounds?—Not of necessity; but I think there would be that consideration to the necessity of the case that they would immediately place themselves in communication with some authority.

2859. Have they any legal authority to interfere?—I am not aware of any.

2860. Then in fact there is an absence of sanitary authority in the port as a port?—Yes, as a port there is.

2861. You must have a conjunction and agreement between the several authorities, and even then you find it difficult to carry out sanitary arrangements?—I find that there has been a difficulty in arriving at a conclusion satisfactory to all the authorities in the event of any combined action being necessary.

2862. Would the nuisance authority have sufficient power in Newcastle under the Act of 1866 to carry out any sanitary arrangements such as those you have described?—I should say within the port of Newcastle there would be no difficulty in the inspector of nuisances taking cognizance of vessels; but what I refer to is combined action for the river as a whole.

2863. Would the nuisance authority go on board ships and inspect the arrangements for the health of the seamen?—No; I do not think so; I would rather expect that their authority lay on the land, and that the floating population is under the jurisdiction of some other authority.

2864. Do you know in what way the Act of the 30th and 31st of Victoria, the Act of 1867 which regulates the accommodation of seamen on board ship with regard to health, is carried out in Newcastle?—I do not.

2865. Have you a local marine board in Newcastle?—We have a local marine board.

2866. Do you happen to know whether the local marine board have appointed medical inspectors to see whether seamen are in a proper state of health before they embark?—The Local Marine Board have appointed a surgeon to examine the men when requested by the owner or captain.

2867. But the chief deficiency that you have to complain of with regard to sanitary arrangements in the port of Newcastle you would confine simply to the absence of united authority over the whole of the river?—Yes; I think it is desirable that where the port is so much of the nature of a town, and the interests are so common, there should be some board having concurrent jurisdiction over all defined authorities.

2868. But you think with regard to those vessels which lie absolutely within the jurisdiction of the port of Newcastle the sanitary powers are sufficient?—I think the sanitary powers between the local marine board and the nuisance authority would apply to the vessels quite within that district as far as being in close contact with the town.

2869. But you have no experience of those powers having been put into execution?—No; I have no experience of that, except in the case of emergency which was put to me.

2870. (*Earl of Romney.*) With reference to what you said when you detailed to us the course of proceeding in order to stay a particular nuisance, you set out from the serving the notice in the first instance until the hearing before the justices and the order, how many Acts are in operation to do all that?—That would depend first of all upon what nuisance it was.

2871. Take any one case where you have to proceed under various Acts?—I ought to do that with diffidence, as I am not able to refer to the law so definitely off-hand.

2872. Is your own Act of 1853 insufficient for doing all those things?—No, not insufficient, we get at it somehow or other, either by our own powers or the general law; but the process is too cumbersome. To remedy this, in letting corporation property, we make cleanliness one of the conditions of tenancy in our form of agreement.

2873. In what way is it cumbersome?—We first of all have to observe a defect by the officer before he can take any action, then he has to give notice that he has observed it and it must be redressed; he has then to see whether it has been redressed, and if not he has to give information to the magistrates, then a summons must issue and before the hearing he must see whether it has been redressed, and with respect to a certain class of nuisances of that kind I think that the statute should speak out and say that when observed it should immediately be penal.

2874. Is it not already penal, and is not that course of proceeding necessary in order to afford the party opportunity to know when he is to appear and answer the charge made against him?—Yes, I think he must have that opportunity, but we have so many notices, as will be observed from the return I produce.

RETURN showing the action taken by the Sanitary Staff of Newcastle-upon-Tyne (with especial reference to the Preliminary Proceedings before the Laws can be enforced for Nuisance Removals) in the six years ending August 1868.

Character of Offence for which the Law was applied.	2 Years August 1864.	2 Years August 1866.	2 Years August 1868.
Rooms unfit for human habitation	29	517	424
Rooms whitewashed and purified	2,230	4,993	3,358
Yards, staircases, and passages cleansed	386	608	323
Privies and ashpits cleansed	3,059	4,103	*890
Drains and gutters cleansed	415	404	348
Stagnant pools and offensive accumulations removed	937	704	1,289
Removal of swine	738	717	107
Offensive manufactories	40	165	35
Water-closets cleansed	117	332	111
Smoke prevention	160	6	243
Repairs to water spouts	323	47	415
For supply of water to tenements	—	—	741
Defective water-closets and privies	—	41	546

* This duty being now performed by the corporation staff, accounts for the comparative decrease in the number of these accumulations since 1865–6.

2875. All that you object to is the course of proceeding?—Yes.

2876. Not to any defect in the law?—No, I think we do reach the nuisance.

2877. You have complained with regard to slaughter houses being started up in the middle of the town. If I understand you rightly, since the year 1853 no slaughter houses can be started without the authority of the corporation?—Yes, that is so, but I refer to the old town, the ancient prescriptive town in which those things have gone on from time out of mind; there have been always shambles in certain localities, and they continue. The Act provided that whatever existed should be licensed.

2878. But ever since the year 1853 there has been full power to stop any new slaughter house being erected or being carried on, because it cannot be done without a licence, is not that so?—As regards Newcastle it has not been in operation since 1853.

2879. But that has been the law under your local Act since 1853, has it not?—There was a power in the Act of 1853 over slaughter houses, but all then in existence were to be taken as granted.

2880. But with regard to any new ones they can only be set up under a licence?—Yes, that is so.

2881. Then as they cannot be started without a licence, it is within the power of the authority who

grant the licence to refuse it, and then no new slaughter house can be carried on?—The authorities have been diffident in saying that they would refuse a licence for the simple reason of position with respect to houses.

2882. That is like the case of public houses, is it not?—Yes.

2883. You have stated that it never came to your knowledge that anyone complained about the state of the river, as to any nuisance of smell?—Not at Newcastle.

2884. There are but few waterclosets in Newcastle at present, are there not?—But few, comparatively speaking.

R. K. Carr, Esq.

10 June 1869.

2885. Therefore very little of the fœcal matter goes into the river?—Of the properly offensive matter I should say so. Most of that is carried away from the ash-pits and privies.

2886. Is there a tendency for waterclosets to increase or not?—It is intended that they should increase.

2887. And being so increased they will run into the main sewer, and from the main sewer into the river?—Quite so.

2888. And then that offensive matter will come up and down with every tide?—Yes, as I before explained.

The witness withdrew.

(17.) Cuthbert William Johnson, Esq., examined.

C. W. Johnson, Esq.

2889. (*Chairman.*) You are the chairman of the Croydon Board of Health, are you not?—I am.

2890. Was not Croydon one of the first places to which the Public Health Act of 1848 applied?—It was. It was in the first confirmatory Act.

2891. And Croydon afterwards adopted the Local Government Act of 1858, did it not?—Yes.

2892. What is the extent of the district under the jurisdiction of your local board?—The entire parish; about 10,000 acres.

2893. What is the population?—The population is now nearly 60,000.

2894. Is not Croydon a very rapidly increasing district?—It increases at the rate of between 4,000 and 5,000 persons a year.

2895. When you talk of 10,000 acres, is a considerable part of that area in agriculture, and not built upon?—A large portion of it.

2896. Has Croydon made a large outlay under its local government Act powers?—Yes; and under the Public Health Act also, a very considerable outlay. I think we have borrowed rather more than 200,000*l.*

2897. How have you borrowed it?—By mortgage of the rates, and almost entirely of various insurance companies.

2898. What is the rateable value of your district?—About 200,000*l.*, or a little over; about 210,000*l.* It keeps increasing, because house property increases so rapidly.

2899. Can you state the largest amount of rates levied in the pound in any one year for local government purposes?—

	In 1867.		Now.	
	s.	*d.*	*s.*	*d.*
General district rate, Lady Day -	1	8	1	6
„ „ Michaelmas -	2	0*	1	4
General purpose rate (for the year)	0	1½	0	1
Special district rate (for the year)	0	7	0	6
	4	4½	3	5

2900. Is the whole district under your local board in one union for Poor Law purposes?—It is.

2901. Could you also state the amount of poor rates in any one year?—In the year 1847 their amount was 3*s.* 6*d.*; for a few years afterwards, 3*s.*

2902. I think your chief outlay under your local government powers has been for sewage utilization and water supply?—Yes.

2903. With regard to sewage utilization, we do not wish to enter into the comparative merits of different methods. The Croydon plan is very well known, but what we wish to know is whether you think that the law gives you ample powers to carry out the system which you have adopted?—It does.

2904. Have you any suggestion to make as to the improvement of the law or of the authorities with regard to such operations?—Not with regard to the sewage irrigation or the utilization of sewage.

2905. Have you purchased land for the purposes of the utilization of sewage?—We have, I think, about 85 acres.

2906. Do you consider that your present system of sewage utilization succeeds?—Quite so.

2907. Does it cover its own expenses by the sale of the produce?—It does, and in one or two instances far more.

2908. Is the drainage of the town carried out upon one system for that ultimate purpose?—It is.

2909. And is every private house obliged to conform with your general regulation?—Yes, every householder is obliged to do so.

2910. Have you found any difficulty in enforcing such regulations upon private owners?—Not any.

2911. Has any litigation occurred between your board and the owners of property?—Nothing worth mentioning. Wherever we bring a sewer within 100 feet of a dwelling we make them connect the house with that sewer. Of course we abolish all privies; there are very few of them left now.

2912. Have you actually abolished privies?—Yes, as nearly as possible; we cannot of course where there is not a sewer within 100 feet of the house; we have no jurisdiction in such cases, but otherwise we have filled them up at a great rate; we filled up, I think, in the first few months, about 2,000 or 3,000 cesspools.

2913. Then you have adopted generally the principle of waterclosets?—Almost exclusively.

2914. Under penalties?—No, we have not had any occasion to inflict penalties; we give them notice to do it, and if they do not do it, we do it for them.

2915. Have you any staff of inspectors to carry out those regulations?—Yes.

2916. How many?—We have two nuisance inspectors, and we have two or three house inspectors who inspect the buildings and houses, and so on.

2917. Are those nuisance inspectors under your Poor Law authorities or under your local board?—Under our local board.

2918. Have not the board of guardians an inspector of nuisances?—I think not.

2919. Have you any medical officer?—We have not; we have two physicians on our board who act without pay.

2920. Your powers are complete for all local government purposes, are they not?—We find them so.

2921. Have you to co-operate with the board of guardians in any of those functions?—I think not.

2922. You have found some difficulties, have you not, as a suburban district with regard to your water supply, part of your district lying in the field of one of the London companies?—That is so, the Lambeth Water Company have the power of coming all over our parish with their mains.

2923. What arrangements have you come to?—The directions of the Act are, that you shall not lay down any water mains or take any measures for supplying our town with water as long as there is existing a water company willing and able to supply the inhabitants. When our board was founded in 1849 we found that the Lambeth Company had ample power to go all over our parish, but they had not laid their mains; so we gave them notice that if within a certain time they did not lay their mains down we

* The 2*s.* was an exceptionally high rate, and made to supply for deficiencies in the estimates.

C. W. Johnson, Esq.
10 June 1869.

should take the matter in hand. To our great satisfaction they did not lay water mains down, and then we constructed waterworks of our own, which have inured to the great comfort and health of the parish, because we get good water out of two wells.

2924. Have you in fact excluded this Lambeth company from your field?—We gave them notice that we should extend our supply to a radius of two miles from the Town Hall, but that does not take in the whole parish. We did not go any further, because the Lambeth company had got their mains in part of our parish already before we gave them that notice. Then, having given them notice that we should confine ourselves to that radius of two miles from the Town Hall, we could not go any further because they have brought their mains since close up to where ours terminate; but it is very awkward, because the people of the Norwood end of the parish, who are supplied by the Lambeth Waterworks Company, do do not like the water so well as they like our own water.

2925. Do you consume much of your water supply for public purposes, such as flushing sewers and watering streets, and so on?—Yes, a great deal.

2926. How would you cover that expense?—That is paid for by the rates.

2927. What arrangement is made for the supply of private houses?—They are supplied by a rate. It is a very important part of our arrangements, because we have constructed our scale of charges so low as to induce everybody in fact to have the water; and I think that it is one of the most important things for the Commission to consider, because the real truth is that the supply of a town with a bountiful supply of water is the foundation stone of all sanitary improvement. For instance, we charge the cottagers 1*d.* a week or 4*s.* 4*d.* a year for the constant supply; then when we get up to cottages rated as high as 10*l.* it is only 5*s.* in the special district and 8*s.* 8*d.* out of the district. So that for 5*s.* a 10*l.* a year house gets the water on night and day.

2928. Do I understand that the private rate scarcely covers its own expenses, but throws to a certain extent a portion of the expense of the private supply upon the public rate?—No, it pays its way.

2929. When you say that it was fixed very low, do you mean to say that it is self supporting?—Yes, it is self supporting. Our object in making this scale, which I shall beg to hand in, was to get the charge as low as possible for the labouring classes; it rises faster above.

The witness delivered in the following Table:

CROYDON LOCAL BOARD OF HEALTH.

Water Rate.—Scale of Charges.

		In the Special District. Per Annum.			Out of the Special District. Per Annum.

„	„	200	0	0	2	5	0	8	5	0

The expense of constructing the waterworks was borne by the special district only, and hence the increased charge to consumers out of the special district.

2930. Do you use a part of your water supply for baths and wash-houses?—Yes, we do.

2931. Are they generally used by the labouring classes?—They are.

2932. Can you state to us the rate of mortality in Croydon?—In 1849 the rate of mortality was 26; at the present rate it is now 18·5. We have a quarterly report which is constructed by a gentleman who was an eminent physician there, Dr. Westall, classifying all the diseases and the rates of mortality, and, with the permission of the Committee, I will hand in our last quarterly return, which is as follows:

PARISH OF CROYDON.

QUARTERLY MORTALITY, from January 1st, 1869, to March 31st, 1869, inclusive.

Diseases.	North.	Norwood.	East.	South.	West and Central.	Union House.	1869.	M.	F.	1868.

171 Notices for New Houses were given for the Quarter ending 31st March 1869.

April 1869.

E. Westall, M.D.,
For Local Board of Health.

2933. Can you distinctly connect that reduction of the mortality with your sanitary improvements?—We do most clearly.

2934. Have you any difficulty in carrying out the effectual removal of nuisances?—No, no greater difficulty than always occurs in most places in looking after people.

2935. Have you had any difficulty in charging the expense of such nuisance removal upon the persons liable?—No; we give them notice that if they do not remove the nuisance our people do it, and there is an account of our charge sent to them, and they are summoned before the magistrates if they do not pay.

2936. Have you any suggestions to make as to larger powers being required by local boards to prevent the erection of houses on unwholesome sites?—Yes, I have. We find that every now and then there are plans of buildings coming before us for approval in places which we see at once are not fit sites. For instance, we have a great many places where they get gravel, and when they have got the gravel out it is very likely the water comes in, and then the owners, not knowing what to do with this land, build cottages upon it, or houses of an inferior description, and we under our Acts have no power of saying "That is an improper site." All we can say is "Well, then, our "officer must see to the best possible mode of draining "them;" that is to say of the house sewage; and it is generally done by a cesspool, because the level is too low to reach our sewers. We think that we ought to have power to say "That is not a proper site for human dwellings."

2937. Does not the 34th section of the Local Government Act of 1858 enable every local board to make byelaws with respect to the level, width, and construction of new streets, and the structure of new buildings?—Yes.

2938. And does that enable you to do what you wish to do?—No, I am afraid not. The whole question of byelaws is very indefinite. The Court of Queen's Bench rule, that although you have got your byelaws confirmed, if they are contrary to the common law they are void, and then that opens a famous door for litigation.

2939. Have you got byelaws sanctioned by the Secretary of State?—We have.

2940. Do you think that any of those byelaws which you have might be made matters of general legislation?—That I have not considered. I am not able to say; I daresay they might.

2941. Have you had much communication during your experience with the Local Government Act Office?—Yes, a great deal.

2942. Have they interfered much with your proceedings?—No; they have generally aided and assisted us very materially.

2943. Have you any suggestion to make as to the relation between that office and your local board as regards any improvement?—No, I think not.

2944. Do you think that any intermediate board between the local government office and your local board would be useful?—I should think not; it would be decidedly a nuisance.

2945. Have you any reference to make upon any

W. Johnson, Esq.

June 1869.

subject to the Quarter Sessions?—We have never had any occasion that I remember.

2946. What appeal is there from your decisions on the part of any persons who might feel themselves aggrieved by anything you have done?—They have an appeal in some cases to the Secretary of State, which is very simple; they have nothing to do but to write to the Secretary of State, and then he sends us word to stop until he has sent down a commissioner, and then in other cases they may go to the Quarter Sessions.

2947. Is there any other suggestion that you would wish to make to the Commission?—I think with regard to the existing waterworks companies that if the power was given to the local boards to take, of course at a proper valuation, any portion of their district, it would be very useful. For instance, in our parish of Croydon there is the large district of Norwood, which the Lambeth Waterworks Company supply, and we cannot go there, although we have an abundance of water to supply them. If we had the power of purchasing that portion of the district, buying their pipes, and so on, and their rights over it, it would be very useful.

2948. Do you find in the operations of your board any difficulty from the number of Acts which you have to deal with,—the Act of 1848, the Act of 1858, the Nuisance Removal Acts, and the Sanitary Acts of 1866 and 1868, and the Sewage Utilization Acts? Do you think that the consolidation of all these Acts into one might simplify your operations, and render them more economical?—I think it would be more convenient for those who have the administration of those Acts, but otherwise we have no great difficulty. We fish it out as well as we can. There are certainly a great many Acts in Glenn's book,—Nuisance Removal Acts and all those things; if they were all in one Act of course it would make it more easy I daresay for those who are not lawyers, which several of us are not; and other boards also would find a great advantage in it, even more than we should.

2949. You seem to have a very active sewerage board, but do you not think that the multiplicity of Acts renders people ignorant of the law, and of their liabilities?—I should think most decidedly it would be better if they were all consolidated and simplified; there is no question about that.

2950. Do you think that not only the law but the authorities might be simplified?—I am not able to say anything about that.

2951. You have found no conflict between the sanitary authorities, the sewage authorities, and the local authorities of various kinds under those different Acts?—No we have not. There is one thing which I would also wish to suggest, and it is this: under one of the sections of our Act we have the power, in case we find that a house is not supplied with water, to enforce the supply, provided we can do it for a cost of not more than 2*d.* a week. Now cases occur, and have recently occurred in our parish, where there are houses which are rated so high that we cannot under our scale enforce it at 2*d.* a week, and yet we should like to enforce it, and we think that we ought to have the power of enforcing it when we can do it at the regular established scale. For instance, there are some large houses in our parish that have got into a state of dilapidation, and have been let out in tenements, and have got a number of dirty low people in them. We should like to enforce a supply of water there, but we cannot do it, because we cannot do it for 2*d.* a week.

2952. (*Earl of Ducie.*) You have given us an account of what appears to be a very great success; are the conditions exceptionally favourable at Croydom?—No, I think not; we are favoured in one respect, that we are on the chalk formation, and are able to get a copious supply of pure water, which perhaps might not happen in many places; we are just at the meeting of the London basin clay and the chalk formation, and by digging about 40 or 50 feet down we get into great fissures in the chalk which yield an abundant supply of pure water.

2953. You attribute much of your success, do you not, to your supply of water?—I look upon it as the foundation stone of everything in sanitary matters, because, if the water is your own, it enables you to flush the sewers copiously; ours are flushed every week, and not done by halves but done thoroughly; and then you have this advantage, that when you have got to deal with the utilization of your sewage it is so fresh that putrefaction has not commenced, and you therefore have a more inodorous mass to deal with, and when it is diffused over your meadows you do not perceive any smells, whereas if you have the contents of a parcel of stagnant cesspools, decomposition having taken place, a nuisance is created.

2954. You state that nearly the whole town is supplied with waterclosets; are there no ashpits in use?—Yes, there are.

2955. I mean by ashpits the use of ashes in privies?—No, that would be an abomination.

2956. Have you no daily scavenging of ashpits?—There are scavengers who go round constantly. We have about a dozen always at work going round, but they only clear out dry ashes, we do not allow them to have any privies like I heard described here as existing at Newcastle.

2957. (*Lieut.-Col. Ewart.*) You have mentioned that you have principally borrowed your money from insurance companies, at what interest did you generally borrow it?—Generally at 5 per cent. Some we got at $4\frac{1}{2}$.

2958. In what way do you repay it,—by a sinking fund?—No, by paying it off $\frac{1}{30}$th every year. It is done in a peculiar way which I could not without some little explanation make the commission understand. It is a kind of annuity, so that the total amount of principal and the interest are always the same.

2959. Do you mean that you repay the interest and the principal in 30 years by equal instalments?—Yes, about that. The sinking fund plan which was directed by the Act was impracticable, it could not be worked.

2960. Why was that?—Because you could not tell, as you would have to buy consols, what sum you were going to buy, because the price varies, and you do not know at the end of 5 years or 10 years what the price of consols would be, so that you might be buying too little now and too little then. Ours was a plan which in fact I concocted, and which met with the approbation of the Government, by which we paid always an equal sum; and there is a scale, which I could furnish the Commission with, so that as the interest decreased the payment of the principal increased, so that it came exactly to about the same thing—about 30 equal instalments of principal and interest; I cannot describe it better to you than as a kind of annuity.

2961. Do you think that it would be an advantage if greater facilities were granted for borrowing money for public works through the aid of a Government department?—Most decidedly. If Government would guarantee the borrowing of our money upon the mortgage of our rates we could get money at $3\frac{1}{2}$ per cent. instead of 5.

2962. Is the house water supply of which you have spoken constant or intermittent?—Constant.

2963. I think that at Croydon you have two separate areas for the utilization of sewerage, have you not?—We have.

2964. What distance are your sewage works at Norwood from the residences?—I think they come within half a mile of some of them.

2965. Has their proximity been found to be any nuisance to the houses?—No.

2966. Have you not had any complaints?—Yes, of course we had complaints, but they have all turned out to be baseless when they have been examined, although they were attributed to—. When you begin to irrigate with sewage if there is a smell of any sort

in the neighbourhood, people always impute it to the sewage, and then you have to send somebody to examine into it and to take the complainants with you and to convince them that it is not due to the sewage.

2967. But you believe that there has been no well founded complaint?—I do.

2968. From your experience and observation of the sewage utilization at Croydon do you see that there would be any great difficulty in applying it for large towns generally?—Not the least.

2969. Have you had any cases in your local board since it was first established of enlarging the area, or have you the same area that you had originally?—We have exactly the same. We had the whole parish to begin with.

2970. Do not you think that cases may arise in which it is desirable for administrative purposes to annex an adjacent district?—I should think so.

2971. Do you think that the present machinery for that purpose is sufficient?—I have never had any reason to doubt it. There are directions in the Act by which if you want an alteration in the area you can do it; but I have never had occasion to apply my mind to study how it worked.

2972. Have you arrangements for the inspection of houses when they have been completed and before occupation?—We have.

2973. They are inspected with reference to the numbers likely to occupy them, are they not?—Not so much as to the construction of them, and to whether the windows open at the top, for instance, and whether the ceilings are of the proper elevation, and whether they are properly drained and supplied with water.

2974. (*Sir Thomas Watson.*) As to the constant supply of water which you have spoken of, which you say is taken even to the humblest houses, is it carried to the house itself, or are several of those houses supplied from some common source,—a stand pipe for instance?—No; the water is carried into the house, and they may have taps all over the house if they like, because we encourage the use of water as much as possible.

2975. (*Mr. Bircham.*) Have you no special legislation at all?—No, nothing that bears upon this subject.

2976. In carrying out this constant supply you rely only upon the Local Government Act for the authority under which you act in the definition of pipes and cisterns, and so on, in houses for prevention of waste?—I should not say that we do not complain of waste, because there is great waste of water, and there always will be on the system of constant supply.

2977. Do you think that there could be any improvement in the general law upon that subject, giving you greater authority inside people's houses, which would prevent waste?—I do not know that it would. If there were some larger penalties imposed it might do good; but we have extreme difficulty to prevent waste of water; the waste is very great indeed.

2978. Your supply is derived from wells, is it not?—Yes, two wells, partly artesian and partly ordinary wells. For instance, one was made about 60 feet in depth, the other about 190 feet, and from these depths the water rises.

2979. You said that 200,000*l.* had been spent by the local board in Croydon. Can you tell how much of that has been spent upon water supply?—About 70,000*l.*

2980. In suggesting other legislation for enabling the local board to possess itself of a water company's position, what you want is power to buy a part of a company's district as distinguished from the whole?—Just so. I think that there ought to be a general power to a local board either to purchase the whole or a portion, because we have a strong opinion that the water supply ought not to be in the hands of private companies.

2981. (*Mr. Shaw.*) Some years ago I went over your experiments of sewage irrigation on the Carshalton side, and I think there you had principally green crops?—Yes.

2982. Do you still find them answer best?—Yes.

2983. It is a very light soil on that side, is it not?—Yes, it is alluvium.

2984. Is it not a stiff soil on the Norwood side?—Very stiff indeed there.

2985. The soil on the Carshalton side would evidently take a great deal of moisture without being the worse for it, but do you find any difficulty in applying that experiment upon the Norwood side, where the soil is stiff?—Not any.

2986. It takes that amount of liquid without difficulty, does it?—Yes; and we were very much disappointed, of course pleasantly so, because we had an impression that the London basin clay would not admit of sewage irrigation; that it was too impervious owing to its adhesive nature, and that the sewage could not penetrate to the roots of the grasses; but we found, which was a little curious, that a large portion of the fibrous roots of the grasses came out of the soil after the sewage, as it were, and formed a matting over the surface, so that the quantity of grass which is produced upon that stiff clay is even greater per acre than upon the Beddington soil, and the water runs off, if possible, brighter.

2987. Is there much offensiveness from the greater quantity of sewage matter keeping near the surface in the stiff soil?—No. In the Norwood district that is supplied by the Lambeth company the quantity of sewage is measured out by the quantity of water which they supply the district with. As their supply is limited, being intermittent, and only about once a day, the quantity of their sewage is less, and consequently is stronger than ours; but still there is no difficulty in working the thing.

2988. You spoke of having filled up cesspools and done other works, and you mentioned that if persons resisted you would do the work for them; do you find that a preferable method to sueing them before the magistrates, and imposing upon them a continuing penalty for not doing the work themselves?—In practice we very rarely have to enter upon the premises. Of course we do not stand any waste of time, but the people, when we give them notice, will very readily do it themselves, or ask us to do it, as we can do it cheaper than they can.

2989. When you spoke of parties applying to the Secretary of State, and the Secretary of State telling you to stop until he had made some inquiries, has he any statutory power to do that?—Yes; I think so.

2990. Do you happen to remember under what Act that authority is given?—I cannot; but I know that he has the power.

2991. As to those houses which you spoke of which have a deficient water supply, houses of originally large size and afterwards let out in tenements, is there any water supply at all in them or is it merely insufficient?—In two or three cases which have been brought to our notice the water supply is quite absent. They are obliged to go and borrow water; they get it from public-houses, or from their other neighbours.

2992. Do you know the clause in one of the Metropolitan Acts that where a house has been dealt with in that way, and thereby a larger number of persons brought into it than it was intended for, and so the number of persons become too great for the capacity of the cistern as originally made, there is power to the vestry, either to require the occupier of the house to make a larger cistern, or else to submit to be treated as a case of overcrowding?—I am not aware of any such clause.

2993. Would you think that a good clause for meeting such an evil?—We should not have anything to do with cisterns, because we generally have set our faces against cisterns. Our water supply is always constant.

2994. You spoke of the inspection of houses with reference to ceilings and windows and so on; do you inspect twice, once when the foundations are laid and again when the house is completed before it is inhabited?—Yes; and they cannot occupy the house till they have our certificate.

W. Johnson, Esq.

9 June 1869.

2995. Do you remember what clause that is under?—No, I cannot remember; if it is not in a clause it is in one of our byelaws.

2996. Have you adopted the lodging house clause in the Act of 1866 with the consent of the Secretary of State?—No, we have not.

2997. (*Mr. Powell.*) Do you find in the houses of the humblest class any inconvenience arising from dampness or the like, owing to the bursting or leakage of water pipes, yours being a water supply to each house however humble?—We have never met with that inconvenience.

2998. You have a good many dwellings of a very humble class, have you not?—Yes.

2999. (*Mr. Cave.*) Why do you say that the 34th section of the Local Government Act, with regard to the construction of houses, does not apply to you?—I do not remember saying so exactly.

3000. (*Mr. Powell.*) I presume what you want is power to keep up the ground floor?—Yes.

3001. (*Mr. Cave.*) What you state is that you cannot prevent a house being built in what you consider a bad place?—Upon an improper site.

3002. So that the requirements of the Act cannot be carried out on that site?—Precisely so.

3003. And that the site itself prevents their being efficiently carried out?—Just so; we find those houses in pits and low-lying places where we know that fever will most likely visit the tenant when they are built, and yet we cannot stop them.

3004. And you do not consider that those provisions in the 34th section, with respect to the free circulation of air and to drainage, prevent your stopping the building of a house in a place where neither of those things are possible?—Just so; but I think you will find that that relates to the level of the streets, and where they use the word drainage the Court of Queen's Bench ruled that that referred to the sewage of the house and not to the land upon which the house is built.

3005. How do you take the sewage to the meadow which you irrigate?—It goes partly through a covered sewer where it is desirable, and partly through an open channel about a mile and a half.

3006. How near are the nearest houses to the open channel?—Some of them are very close.

3007. Is there no inconvenience from that open channel?—No, none.

3008. Do you take any method of deodorising it except by diluting it with water before it goes into the open channel?—Yes, in very hot weather in summer now and then, if there is any effluvium, we do. After the sewage has got from the town through the main sewer, about three quarters of a mile, it then approaches the meadows. Then in order to avoid the distasteful appearance of paper, and what not, there are two settling tanks which have a filter erected in the centre, which strains out the paper and large lumps of things before it flows on to the meadow. Then in warm weather those tanks that are not emptied above once a week or 10 days are apt to get a little offensive, and in that case we use some carbolic acid and other things to stay it. But we are now going to do away with those settling tanks. We have got a plan by which instead of being strained in the tank it will be strained in a kind of revolving sieve, where it will all pass out, and there will be no time for any decomposition to take place; it is a plan of our engineer, Mr. Baldwin Latham.

3009. Is it your opinion that such a plan as you adopt would be wholesome in a locality much more thickly peopled than the one which you have around Croydon?—Yes; I think if the sewers are properly constructed, and there is an abundant supply of water, the sewage is almost inodorous. Having had pretty considerable experience in this matter I am quite prepared to say that not one man in 10,000 knows what town sewage is.

3010. All that is done under the general sanitary Acts and under byelaws of your own?—Yes.

3011. You have no local Acts of your own I believe?—We have no local Acts applying to this subject.

3012. But you have byelaws I think you stated?—Yes, which have been confirmed by the Secretary of State in the usual way.

3013. Are those byelaws founded upon the general Acts or are they merely byelaws with regard to the special circumstances in your own case?—I should say that they are founded upon both, some upon the Public Health Acts, but chiefly upon what we require for regulation. Formerly there were certain things done which the Act provided for; those sections were repealed, and in their place we were authorized to make byelaws. I do not think that that is a very satisfactory way; it would be much better I fancy if they were embodied in some statute.

3014. You think then that a general Act might be passed which would apply to the circumstances of all places?—I should think it might be so.

3015. Have you given much attention to that subject?—I cannot say that I have as much as to other portions of our inquiry.

3016. Of course, having an active committee such as you have, you have not been liable to complaints or to inspectors being sent down from the central authority, and therefore you cannot speak upon this point?—I think we have not had many complaints to induce the Secretary of State to send down anybody to see how we are going on, and I believe he has generally approved of our conduct.

3017. If anything you have rather been in advance of the age instead of neglecting your duties?—Unfortunately we were in advance at first. We have had to fish out, as well as we can, all sorts of things. We have never had any precedent. We had to go through a most tremendous lawsuit, because some millers had the notion that when we made the well we robbed them of the water, although it had no connexion with their river. There is no doubt it intercepted the water before it reached the river to some small extent, just as a water butt at the corner of a roof it intercepted their water. However, we had to fight it out at an expense of 5,000*l.* or 10,000*l.*

The witness withdrew.

Adjourned to Monday next at 12 o'clock.

Monday, 14th June 1869.

PRESENT:

THE RIGHT HONOURABLE CHARLES BOWYER ADDERLEY, M.P., IN THE CHAIR.

The EARL of ROMNEY.
The EARL of DUCIE.
The Right Hon. RUSSELL GURNEY, M.P., Q.C.
The Right Hon. STEPHEN CAVE, M.P.
Sir THOMAS WATSON, Bart., M.P., F.R.S.
Lieut.-Col. EWART, C.B., R.E.
SAMUEL WHITBREAD, Esq., M.P.
JOHN TOMLINSON HIBBERT, Esq., M.P.
EVAN MATTHEW RICHARDS, Esq., M.P.
FRANCIS SHARP POWELL, Esq.
BENJAMIN SHAW, Esq.
HENRY WENTWORTH ACLAND, Esq., M.D., F.R.S.
JOHN LAMBERT, Esq.
FRANCIS THOMAS BIRCHAM, Esq.

(18.) HENRY DAVY, Esq., examined.

H. Davy, Esq.

14 June 1869.

3018. (*Chairman.*) You are clerk to the Local Board of Health of Ottery St. Mary, in Devonshire?—Yes.

3019. Will you state what is the nature of that board, and when was it established?—The board was established on the 3rd of July 1850, by an Order in Council.

3020. Under what Act was that?—The Public Health Act, 1848.

3021. When the Local Government Act of 1858 was passed, the powers under that Act became applied to the local board of Ottery St. Mary?—Yes.

3022. I presume that you have no Local Acts?—We have no Local Acts.

3023. What is the area of the district?—The parish of Ottery St. Mary containing 9,944 acres.

3024. How much of that is under the board?—I can scarcely give you the area, if the area of town sewage and water supply is meant; the population of the whole parish is 4,340.

3025. Is it all one Poor Law Union?—The parish of Ottery St. Mary is comprised in the Honiton Poor Law Union.

3026. Is the whole district one parish?—The parish of Ottery and the local district are co-extensive.

3027. Is there a large part of the district rural compared with the town?—Yes, very large; the population of the parish being 4,340, I apprehend that the town itself does not comprise above 2,500.

3028. How was your board constituted? Was it by election?—The members of the board were elected by the ratepayers.

3029. How often does that election take place?—It is an annual election.

3030. Do they all go out every year?—No, three go out each year.

3031. Has any special district been formed?—For the purposes of sewerage and water supply the board voted that a rate should be levied upon the whole parish; that the whole parish should be comprised in the special district for those purposes. It was attempted a little while ago to form a special district to borrow money for paving purposes, but we found that we could not accomplish it.

3032. Then you have no special district rate?—There was a special district rate made for the sewerage and water supply, and a rate was made and money borrowed upon it, but of course after the Local Government Act came into operation, the special district rate ceased to be levied, and the instalments of principle and interest were paid out of the general district rate.

3033. Is there any object for which there is a rate special to a part of the district?—Yes; about three years ago the town was very anxious to have some works of pavement done, which was objected to by the board, except on the condition of a special rate being made upon the town district; that was consented to, and an application was made to the Secretary of State, and a loan was sanctioned to be paid by a rate upon that special district, but the board did not adopt it and would not act upon it, because they found they could not borrow the money without having the sanction to borrow upon the whole property within the parish as security.

3034. Then it was not done?—No; it was not done.

3035. And the work remains undone?—The loan was not made and the work was not begun with the view of carrying it out immediately, but the works have been commenced by a rate levied on the town district, and they are not yet completed.

3036. Under the Act, some rates fall more heavily on the town part than on the rural, do they not; for instance, the highway rate?—The houses throughout the whole district are assessed at four times their value; that is to say, the value of the land at one fourth of the value of the buildings.

3037. What works have been carried out under your powers?—A sewerage throughout the town district and a water supply; no other public works. Of course there had been a few improvements made, arches turned, and so on, until the paving which I alluded to just now within those three years.

3038. Are the sewage works satisfactory?—Upon the whole I believe they are; it is the pipe system.

3039. What is the nature of the sewage works; is there one drainage system of the whole place?—Yes, with two outfalls.

3040. What is done at the outfalls?—Nothing; the main one flows into the tail of a mill-stream (after it has passed through the mill). It flows into the tail-water. And the other is collected in a tank made on private property.

3041. Are there no irrigating works carried on?—None; at least not in connexion with the public works. There is irrigation in various parts of the parish.

3042. Into those drains which pass to those two outfalls, do all the contents of privies go?—Yes.

3043. Is not there some unhealthy deposit at the mouth of those outfalls?—I am not aware that there is. In the one case it falls into a considerable stream of water, and in the other it is in a covered tank, which is emptied occasionally.

3044. Is the running stream into which the sewage is discharged a river which cattle and human beings may drink from?—It flows into the main river, perhaps, about a couple of furlongs from its outfall. Cattle no doubt drink from the river below the outfall, but human beings certainly not.

5045. Are your waterworks satisfactory?—I do not know whether the pipes for the water supply were quite big enough at first. There has been some corrosion, and we have been obliged to renew the pipeage occasionally.

3046. Is it good water?—Very good water.

3047. Then your only doubt is about the supply being sufficient?—Precisely so. Occasionally a pipe will be defective, because it is choked with corrosive matters.

3048. Where does the water come from; is it from wells, or from what source?—An iron tank was sunk in the midst of a piece of ground which was full of springs, and the water has been drained into it.

3049. What loans have you taken up?—2,800*l.* was borrowed for the sewage and the water supply.

3050. Where did you get the money?—Under the sanction of the Secretary of State it was borrowed from the West of England Insurance Company.

Davy, Esq.
June 1869.

3051. Will you state the terms upon which it was borrowed?—It is payable by instalments in 30 years at 4½ per cent.

3052. And a sinking fund added, I suppose?—No; there is a schedule made stating what the principal and what the interest is, to be paid off each year.

3053. Do you mean in the way of equal instalments every year?—No; it was not so. For instance, 20*l.* of the principal was to be paid off at the end of the first year, and now we are coming to pay off 90*l.*

3054. Was this loan sanctioned by the Secretary of State?—Yes. There was also a sum borrowed for private works, where the owners did not choose to pay, or were not in a position to pay, the charges for the works on their own premises.

3055. In such cases have you borrowed money?—In such cases it was charged upon the property, and a sum of 656*l.* was borrowed from the West of England Insurance Office to pay off the tradesmen's bills.

3056. What security did you take from the owners in that case?—Their property was all scheduled, and a private improvement rate was made upon their property, and that was mortgaged.

3057. Have you had punctual repayment from the owners in every case?—As a rule we have. In consequence of a very destructive fire that occurred in our town in 1866 there were a very great many void premises, and the rates have been paid since. We had no means of enforcing it while the houses remained in ruins.

3058. Has the whole of the sanction that you received from the Secretary of State been acted upon?—No; because we have his sanction to borrow 1,400*l.* for the works of paving, which has not been borrowed, as I said before, and that was because we could not mortgage the rate made upon the special district.

3059. Have you found that the opposite interests of the rural and the town population impede your improvement?—That is an instance of it. It was the rural population who would not pledge the credit of the whole district for the borrowing of this money.

3060. Have you often found such oppositions of interest?—Perhaps it may have cooled the action of the board a little, but the rural members of the board are very respectable men.

3061. Can you state to the Commission generally the present state of the district as compared with what it was before those powers were given you?—I can say from my own memory that for a year or two before the board came into operation fever was very frequent in the summer, quite an epidemic; but for the last 15 years, at any rate, there has not been a case of epidemic fever there. There are occasionally single cases, but they do not extend.

3062. Were there any particular localities to which fever attached?—There was a place, a large open pit, before the board was established, and it was one of the great objects of the board to get rid of that.

3063. Were there places badly drained where fever was constantly occurring?—That was so.

3064. That has ceased to be the case now?—I think it has. I was speaking to one of our medical men on Saturday, and he told me that the last case, where he had had more than one case in a house, was very near the same place, a brook which has now been arched over.

3065. What sort of water did they drink before they had the new water supply?—Pumps were very general.

3066. Were there any polluted ponds or pools that they took water from to drink?—I cannot say that there were.

3067. Can you state the rate of mortality at Ottery St. Mary?—No. Dr. Buchanan was at Ottery some time ago, but he could not ascertain it with any accuracy, and he has mentioned that in his report.

3068. Have you no means of knowing whether the rate of mortality has been reduced by your public works?—I think that Dr. Buchanan said that it was not altered very much.

3069. Can you state the total amount of rates which have been levied in any one year under your Local Government Act?—I think that 2*s.* 10*d.* upon the house property within the entire district is the largest that has been levied. But in the same year 1*s.* in the pound on houses in the town additional for paving, making 3*s.* 10*d.*

3070. But upon the rural property how much?—One-fourth of 2*s.* 10*d.*

3071. But that proportion of one-fourth would apply to all rates, would it not?—Yes, the general district rate.

3072. Can you state to the Commission what the maximum poor rates amount to in your parish of recent years that you recollect?—I think 3*s.* 6*d.* would cover it.

3073. Are there any other local rates besides those included in those two items?—No local rates.

3074. Do you think generally that your local government works satisfactorily, or have you any suggestion to make to the Commission as to its greater efficiency?—I do not know that I could make any suggestion. I think that the management of the parish, perhaps, is rather more regular since the establishment of the board. We have got rid of many vestry squabbles, and there has been only one contest since I have been clerk at the election of members.

3075. Of how many does your board consist?—Nine.

3076. Are the guardians generally on it practically?—No; it is not a thing at all looked to.

3077. Practically, are the men who happen to be guardians generally on that board?—I should say not.

3078. Have you had much communication with the Secretary of State in the working of your board?—Not since I have been clerk.

3079. How long have you been clerk?—I was appointed in 1862.

3080. Have you never had any inspection from the Local Government Office in London?—No. There may have been before I was clerk.

3081. No communication at all?—No, except asking for returns now and then as to the condition of the parish.

3082. Who is your inspector of nuisances?—Mr. Norrington; he is appointed by the board; he is surveyor and inspector of nuisances.

3083. Is he in any other office?—Not under the board; he is an auctioneer and surveyor; he is surveyor to the highway board also.

3084. Do you consider that your nuisances are effectually removed?—Occasionally there is a nuisance of which we have to give notice, but I do not know that there is anything but what we have power to get removed when we discover it.

3085. Do you think that there are any nuisances which are not reported?—I do not think there are.

3086. Practically, have there been many reports of nuisances?—No, generally if a notice is given to people, they remedy it at once.

3087. Is it your belief that the fact of nuisances existing is really brought to your notice, and that the nuisances are removed?—It is so. We have several slaughter-houses in a district of the town, and there is occasionally a smell there. There is one very near my own house, but I wrote a note to the man complaining of it, and it was removed directly.

3088. Have you had occasion to carry out your power as to offensive trades in any case?—We have no offensive trades except that.

3089. As to the smoke nuisance, have you any of that?—We do not think anything of it. We have nothing of that kind to complain of.

3090. In fact your drainage and water supply have been the chief things that you have done?—Yes.

3091. Are there any other public works which you think ought to be executed which are not done from

want of power or from opposition?—We shall have great difficulty in completing the pavement, inasmuch as, not having the power of borrowing practically, the rates are felt very much, and some people say in the town,—"This paving does not come near me. I am "not a bit more interested in it than the people in "the country, and they ought to pay for it."

3092. Do you think that you have got as large facilities of borrowing as you want?—I think that we should have carried out the pavement very well if we could have borrowed upon a limited area. I understand the law at present to be that the rates of the whole district must be pledged for money borrowed, and yet there is a power of raising money and to pay it off within a limited district.

3093. Are there any complaints made of the expense to which your works put the place?—I believe that many of the ratepayers complain of the expense.

3094. Do you think that by any amendment things could be done more economically?—Ours are all done economically.

3095. I do not mean the works, but the machinery of your government, whether you could have a more economical mode of local government, either by reducing your staff or in any way economizing your expenses?—I do not think that you could in our case. I do not know of any means of doing so.

3096. (*Earl of Ducie.*) You say that your system of drainage comprises two outfalls, one into the mill tail of a mill and the other into a tank, does that outfall into the mill tail take place near the tideway, or how far above the tideway?—We have no tide.

3097. How far above the highest point to which the tide flows?—Six or seven miles.

3098. Your other outfall is into a tank upon private property, what happens to the sewage in that tank?—It was intended, I believe, originally to have tried to have utilized it, by disinfecting it, but practically it is cleared out occasionally.

3099. At whose expense?—At the expense of the tenant of the land where it is; the board have nothing to do with it.

3100. Is he willing to be at the expense of it for the advantage of using the manure?—He uses it himself for his own purposes.

3101. Then he is willing to be at the expense of removing it for his own benefit?—Yes.

3102. You have no difficulty in getting rid of it?—I never heard of the slightest difficulty.

3103. (*Lieut.-Col. Ewart.*) Have the local board any inspectors for health purposes?—There is the surveyor and inspector of nuisances, the same person that I mentioned before, nothing else.

3104. Have you no medical officer?—No.

3105. (*Dr. Acland.*) Have you any power of regulating new cottages?—We have no power of regulating new cottages.

3106. Have you any power over existing cottages?—Only the power given by the Public Health Act as far as cleanliness goes.

3107. Are there any very bad cottages in your neighbourhood?—There is a cluster of very dirty cottages about a quarter of a mile out of the town.

3108. And is there no power in your board of altering or remedying the evils in them?—If they are reported as prejudicial to health they may be cleansed.

3109. I think that the guardians have the power of obtaining sanitary reports in your district, have they not?—I believe it is so.

3110. But they do not exercise that power in your neighbourhood?—It does not come under my cognizance as clerk to the local board.

3111. Does the local board exercise such a power?—If their officer reports anything dirty, or whitewashing required, two medical men I believe must report upon it.

3112. But the local board does not take the initiative?—No.

3113. Do you know whether in your district there are any societies for giving plans for agricultural cottages?—I have not heard of any.

3114. Then are there no recognized or established plans in the neighbourhood that you know of?—Not that I know of.

3115. (*Mr. Lambert.*) Have you any byelaws prescribing the duties of the officers of the board?—Yes.

3116. And the duties of the clerk?—Yes.

3117. And of the surveyor also?—Yes.

3118. Has the local board incurred any legal expenses during the last three years?—No, except there were some cases taken before the magistrates for enforcing the payment of rates lately, not otherwise.

3119. Have any heavy legal expenses been incurred since the board was established?—None whatever.

3120. Who audits the accounts of the local board?—The poor law auditor, Mr. Tucker, of Ashburton.

3121. How far does he reside from the district?—I think it is about 12 miles from the Newton Station, and then it must be about 30 miles by railroad, about 40 miles altogether.

3122. What fee do you pay him for auditing the accounts?—We used to pay him 2*l.* 2*s.*, but he is now paid 4*l.* 4*s.*, he comes specially for the purpose.

3123. Does he not arrange to audit the accounts of the local board at the same time as he audits the accounts of the union?—It used to be done so, but we have not been able to get them ready in time for several years.

3124. Do not you think it is desirable that some arrangement should be made requiring the auditor to hold his audit for the poor law union and for the local board about the same period?—I think that would be desirable, but we are obliged to give 21 days notice before the audit, and a much shorter period is required for the poor law audit.

3125. Might it not be so arranged by the auditor without difficulty, to hold his audit at the same time or nearly at the same time?—Our accounts to Lady-day are not audited yet. The audit is fixed for the 30th of this month, we could not get it ready before.

3126. But you could have postponed his other audit, could you not?—I do not know.

3127. Did he charge you anything for travelling expenses?—The 4*l.* 4*s.* includes his travelling expenses.

3128. Has he had occasion to make any disallowances?—None whatever.

3129. He has not objected to any item in your account?—No.

3130. (*Mr. Bircham.*) Have you any experience of water being polluted by sewage filtering into the wells?—I do not know of any such case, but I recollect that when the preliminary examination took place before the establishment of the board, evidence was given to the effect that there was then.

3131. Has any correction been applied by the local board in any cases?—Simply that there are no open privies. Waterclosets are attached to every house or group of houses.

3132. Have houses been built either in improper situations or in an improper condition for human habitation in your district?—There was a case of which I heard and I believe it to be quite correct. A man, I think it must have been last year, erected a hut upon some waste land or land that had been waste, he bought it and went into it without any floor, living simply upon the bare earth, and the result was that he suffered from fever for a long while.

3133. That was a simple cause of squatting, was it not?—Yes, except that it was his own property.

3134. Have you any experience of cottages built for letting under ordinary circumstances being let to tenants in an improper condition for habitation?—I heard of a case lately of overcrowding where I presume the man was dividing the house into small compartments.

3135. Was there any attempt made to correct it?—The matter was brought before the board, but we thought we could do nothing, inasmuch as they were

H. Davy, Esq.
14 June 1869.

all members of the same family who were living there.

3136. Do you think that further legislation on that subject is desirable?—I do not know how you could interfere with the members of a family.

3137. (*Mr. Shaw.*) Your board is not in communication with the guardians officially, is it?—No.

3138. Then you do not officially get the benefit of the medical officers of the union?—Not officially, but there is a medical officer of the union residing in the town.

3139. You are not officially in communication with any medical authority so as to have the habitual advice of any medical authority?—No; there is a medical man a member of the board.

3140. But it is not necessary that he should be?—No, it is not necessary.

3141. Does he in any way make inspections or bring in reports, or does he merely judge upon what your inspector has told him?—He merely judges upon what he hears in the board room or upon what the inspector tells him.

3142. So that you have no medical authority to get information and to bring before you the unhealthy state of things that may be existing?—None.

3143. As regards this overcrowding of cottages the only remedy in the case you spoke of I imagine would be some provision requiring greater ventilation to be adopted, seeing that they were members of one family?—I do not know how that could be applied. Of course if there are too many people in a small space there must be a great want of ventilation, but I do not know how it could be applied.

3144. (*Mr. Powell.*) With reference to the clause of the Act of 1866 under which you give notices to persons where there are nuisances, instead of at once issuing a summons I think you state that the notice was generally sufficient; do not you think it very convenient to have that process, and thereby to avoid one of the causes of irritation which arises from the commencement of legal proceedings by summons?—What I meant to say was that generally speaking the intimation from the surveyor had the desired effect.

3145. Do not you think it very desirable to retain that power of notice instead of being compelled to commence your proceedings by a formal summons? I should think so. We have given that notice in one or two cases.

3146. Do you consider that the notice to which you have referred is a sufficient compliance with the 21st section of the Sanitary Act of 1866, which says that before issuing a summons you must give notice?—That is a legal notice under the Act of Parliament. I do not mean to say that a friendly notice from the surveyor was sufficient to justify the issuing of a summons; I meant a friendly notice prior to the notice required by the Act of Parliament.

3147. In the answer that you have given you did, intentionally, or unintentionally, make reference to the powers given under the Public Health Act and the Local Government Act; you are doubtless aware that the local board is also a nuisance authority and has power under the Nuisance Removal Acts?—Yes.

3148. I presume that you enforce those Acts of Parliament and remove nuisances in pursuance of the provisions therein contained?—Yes, of course.

3149. And do you find those powers under the Nuisances Removal Acts in any degree defective?—We have not found them so.

3150. (*Earl of Romney.*) When you use the word "notice" have you not used it in two senses. With regard to the notice which you say has generally been sufficient, have you not meant by that such a notice as where the inspector says to a person, "You "have got a nuisance here, and you must get rid of "it"?—Yes.

3151. Then supposing the person did not get rid of it, would you not consider it necessary to give a legal notice under the Act of Parliament as the basis of legal proceedings?—Yes.

3152. (*Chairman.*) Could you state to us the rateable value of your district?—The rateable value of the houses of the district is 3,636*l.*, and of the land 12,525*l.* That probably may be varied a little by the union assessment action which is now going on.

The witness withdrew.

R. Johnson, Esq.

(19.) Robert Johnson, Esq., examined.

3153. (*Chairman.*) You are clerk, are you not, to the local board of Llanelly?—I am.

3154. Is that on the sea coast?—Yes, of Carmarthenshire.

3155. Under what Act do you conduct your local government?—At the present time under the Local Government Act. The Public Health Act was applied to the district in 1850.

3156. The Local Government Act of 1858 became applied to you, did it not, when the Act passed?—Yes.

3157. In fact you have adopted generally the public Acts?—Yes, quite so.

3158. Have you no private Act?—There is a Lighting Act, and there is a Burgesses Act. Prior to the adoption of the Act of 1848 by the local board the town was under the government of the burgesses and a portreeve under a private Act of Parliament,—the Burgesses Act.

3159. What led to that change in your government?—An application was made, emanating I believe in the first instance in 1850 from the Chamber of Commerce of Llanelly, to have the Act applied to the district. That was opposed for a short time by the burgesses, but they afterwards consented to give way, and the Act was applied, and the local board now exercise the same power as the burgesses did under their Act. They have become trustees of the estates which originally were under the control of the burgesses.

3160. What was the cause of dissatisfaction with the former local government?—I am not aware that there was any dissatisfaction.

3161. What led to the movement for a new form of government?—That I cannot tell. I went to Llanelly only a few years since.

3162. How is your present board constituted?—There are 12 in number, constituted by election.

3163. How many go out every year?—One third go out every year.

3164. Is the parish of Llanelly a poor law union?—No; there are four or five small parishes in the union, besides the parish of Llanelly.

3165. Do the union and the local government district coincide?—No; the district local board is only a small portion of the union. The parish of Llanelly comprises about 20,000 acres.

3166. What is the acreage of the district taken out of the parish of Llanelly?—1,213 acres 2 roods 37 perches.

3167. Can you give us the population of the whole parish, and also of the district?—The population of the district might now be taken at about 13,000. In 1851 it was 8,000, in 1861, 11,000, and I suppose now it would be about 13,000, and the population of the parish would be about 17,000.

3168. Then in fact the district is nearly the whole parish in point of population?—In point of population it is, though not in area.

3169. Can you distinguish in the district what I may call the urban from the rural population; that is to say, the part which is actually covered with buildings, and the part which is more agricultural?—The town is a very scattered town. A large portion of the town lies about midway between the hills and the sea. Then there comes a large flat, and

beyond that is the port, which is considerably increasing.

3170. There are a good many houses about the port, but over the rest of the district are the houses scattered pretty equally?—There is a large unbuilt piece of ground lying between the port and the town proper.

3171. What is the rateable value of the whole of your district?—The rateable value is 35,136*l.* according to the last rate.

3172. Have you carried out many public works under the powers of your board?—There are considerable works in course of being carried out.

3173. Will you state what they are?—Principally sewerage works and water works. The first works that were commenced were for the purposes of water supply in 1853.

3174. That was three years after your board was formed?—Yes.

3175. What amount of expenditure have you made on them?—At that time there was a sum of 10,000*l.* borrowed.

3176. How was that borrowed?—It was borrowed from the Royal Exchange Insurance Company, repayable by annual instalments in 30 years.

3177. At what rate of interest?—Four per cent.

3178. Was there a sinking fund?—No, there was no sinking fund.

3179. Has that 10,000*l.* been expended upon your waterworks alone?—Yes; and in 1859 there was a further sum of 4,000*l.* borrowed for the purposes of the water supply; that was also borrowed from the same company, repayable over the same period, but at five per cent. interest.

3180. Was the higher interest in consequence of the security not being so good?—I do not know what was the cause of the rate of interest being increased, it was before I was appointed clerk to the board.

3181. Were both those loans sanctioned by the Secretary of State?—Yes, all the loans have been sanctioned by the Secretary of State.

3182. Does the 14,000*l.* represent the complete expenditure on the waterworks?—No; in 1865 the board obtained a private Act of Parliament to construct additional waterworks; the 14,000*l.* built a small reservoir which was fed from a river called the Trebeddod River; that, for some years past, has been wholly insufficient for the supply of the public with water, and scarcely sufficient for domestic purposes. They then obtained an Act of Parliament in 1865, and obtained powers for borrowing a further sum of 40,000*l.* for the purpose of constructing an additional reservoir further up another valley, and they have borrowed under that Act of Parliament 27,000*l.*; 35,000*l.* was to be borrowed on the security of the water rates, and 5,000*l.* on the estates belonging to the board.

3183. Have you taken up more than the 27,000*l.* yet?—No, we have only taken up 27,000*l.*

3184. Does that 14,000*l.* and 27,000*l.* represent the total amount of money raised for your waterworks?—Quite so.

3185. Was that last loan of 27,000*l.* raised in the same way as the former loan?—No, it was borrowed from the Public Works Loan Commissioners at five per cent., repayable in 20 years by annual instalments.

3186. Did you go to the Public Loan Commissioners because you could not find better terms in the market, or did you go at once to them?—I am not prepared to say whether application was made to other companies before it was made to the Public Works Loan Commissioners.

3187. What was the security offered for your first two loans?—The first loan was secured by a special district rate, and the second by the general district rates.

3188. Is the supply of water given now good and sufficient?—This year it will be amply sufficient, I believe.

3189. Before, was it both deficient and bad?—It was very deficient, and consequently when the water became low in the reservoir it was very bad. The new waterworks have not been completed at present. The line of pipes is completed, but the embankment of the reservoir has not been constructed, and the supply is not quite perfect at present, in consequence of the communication between the two points, the old works and the new works, being through the old line of pipes, a small nine-inch pipe.

3190. Do you expect to be obliged to raise the rest of the loan for which you have powers?—I do not know that it will be necessary to raise the whole of it. We have not commenced the embankment yet, and some of the members of the board are about having an interview with the engineer, Mr. Beardmore, this week, relative to the appropriation of a part of the loan which has been obtained.

3191. Has there been any opposition made to this outlay on the ground of its expensiveness?—None whatever.

3192. Will you tell us in like manner what you have expended on your sewage works?—In 1861 there was a sum of 1,500*l.* borrowed, and in 1863 5,000*l.* These loans were obtained from the Royal Exchange Company, secured by the general district rates, repayable over 30 years, and with interest at five per cent. We are now negotiating a further loan of 2,000*l.* for sewerage purposes, but that is not completed at present.

3193. Why was it necessary for you to get a private Act to get your additional loan for waterworks; would not a Provisional Order of the Secretary of State have enabled you to do that under the Act of 1858?—No, it would not have been sufficient, because the land which is taken is beyond the district of the board, in the first instance; and there was another objection, because under the Provisional Order we should have been obliged to have adopted the whole of the provisions of the Local Government Act, and to have compensated the owners of the mills and the lands through which the water passed, before we could have done anything at all.

3194. Was your private Act opposed at all?—I believe it was very slightly opposed. There are two clauses which were required to be inserted on behalf of the mill owners or land owners; there was practically no opposition to the bill; the oppositions were all withdrawn before it came on for hearing.

3195. To revert to the sewage loans; has this third loan of 2,000*l.* which you are about now to take up been sanctioned by the Secretary of State?—Yes; we have power to borrow up to the extent of 12,000*l.*

3196. Are those three loans for sewage works and the three loans for water works all the loans that you have taken up?—No; there has been money borrowed for the purposes of building a market.

3197. For any other purpose besides that?—No; for no other purpose.

3198. Can you tell us the aggregate sum that you have borrowed?—The aggregate sum that is borrowed on the primary security of the general district rates, including the special district rate, would be 33,500*l.* money borrowed for waterworks and other purposes; there is power given under the Act to levy a water rate for the repayment of the 27,000*l.*, so that the water rate is the security for the repayment of the 27,000*l.*, but the general district rates are given in as security, but only collaterally.

3199. You have given us four different kinds of security; the special district rate, the general district rate, the water rates, and your own estate?—No; the estate has not been mortgaged.

3200. I thought you said that 5,000*l.* had been raised upon it for water?—There was power acquired under the Waterworks Act to borrow 40,000*l.*, 35,000*l.* upon the rates and 5,000*l.* upon the estate; 27,000*l.* has been borrowed, and the estate has been given in security for the 27,000*l.*

3201. I want to know the aggregate amount that has been borrowed, no matter what the security may be?—In round numbers it would be about 60,000*l.*

R. Johnson, Esq.
14 June 1869.

3202. The rateable value being what?—35,000*l.* A Provisional Order was obtained some years ago enabling the local board to borrow to the extent of two years assessable value, so that we have power to borrow up to the extent altogether of 110,000*l.*

3203. What is the largest amount of rates that has been levied in one year to your knowledge for local government purposes?—3*s.* 2*d.* in the 1*l.*; that is to say, our general district rate is 2*s.* 2*d.*, and in addition to that there would be what is called the water rate of 1*s.* in the 1*l.*, that is for the repayment of the 14,000*l.* We have made one rate this year for the repayment of the instalments on the first advance of 9,000*l.* at 8*d.* in the 1*l.*

3204. Then you have to add special rates to those, have you not?—No; there are no special rates.

3205. Does 3*s.* 2*d.* in the 1*l.* represent the largest amount of rates for local government that you know of in one year?—Not the waterworks loan, that would be irrespective of what may be required to repay the waterworks loan. 3*s.* 2*d.* in the 1*l.* of the general district rate was required for the purpose of repayment of the first two loans, 14,000*l.* for water supply, for sewage works, and for establishment charges.

3206. Can you give us the maximum amount of rates in any one year for every purpose?—Hitherto they have been 3*s.* 2*d.*; at least last year that was so.

3207. Can you state the highest amount of poor rates in one year that you know of?—The highest rate I know of was in 1867, which then amounted to 2*s.* 4*d.* in the 1*l.*

3208. Does the amount of rates that you have stated include the lighting rate and the highway?—Yes, we have no highway rate now. In consequence of the enlargement of the district, the board taking in a portion of another hamlet, we did not see that we had power to make another highway rate extending over a portion of a place.

3209. How are your highways maintained?—Out of this general district rate of 2*s.* 2*d.*

3210. Is that levied in the proportion of one fourth on the land?—Yes.

3211. The area of your district being so nearly the whole of your parish, would not it have been better to have the district and the parish actually conterminous?—I do not think that the area of the district board and the area of the parish are so nearly conterminous; the population may be, but not the extent of the parish.

3212. How many guardians constitute the board of the union?—I do not know how many.

3213. How many members of the board of guardians are members of the district board of Llanelly?—There are no members of the board of guardians members of the local board, excepting those that are so *ex officio* as magistrates.

3214. Do not the functions of the board of guardians and your local board sometimes clash, as for instance in the inspection of nuisances?—We have met with no difficulty in consequence of the guardians being the local authority for executing any of the powers of the Nuisances Removal Act. During the time of the cholera in 1866 the Diseases Prevention Act was put into force, and the guardians being the local authority for executing that Act an arrangement was come to by which the local board carried out the provisions of that Act, paid the inspectors, and supplied medicines, and sent in their accounts afterwards to the guardians, which were paid.

3215. Have your local board got an inspector of nuisances or more than one?—Only one.

3216. I presume that the board of guardians have an inspector of nuisances?—Yes, I believe they have—the inspector of nuisances for the local board is the surveyor.

3217. Practically are your nuisances efficiently removed?—Latterly, I think they have been within the last two years. Some three years ago we had a little difficulty, especially with regard to pigs and pigsties. The difficulty that we met with in executing the provisions of the Act was that we could not see that the Act applied to the removal of a pig.

3218. Is there any doubt about the meaning of the Act?—There is power of course to remove the nuisance, but not the animal which causes the nuisance, unless evidence is produced before the justices to the effect that it is impossible to keep such an animal without being injurious to health. I happen to hold the office of clerk to the county justices, and I know the difficulties that we have met with under those summonses.

3219. Do you think that there is any defect of power in removing nuisances; for instance, the power as to entering premises?—We have found no difficulty at all under the 59th section of the Public Health Act of 1848. They generally comply with the 24 hours notice of the inspector. There is an assistant inspector for Llanelly, and scavengers and the inspector goes round daily, and if he finds any nuisances existing in the cottages or in the gardens he gives the parties notice, and as a rule we hear nothing further from him. The local board have never found any occasion at present to take any proceedings against parties.

3220. What is the nature of your sewage works—is it a complete system of drainage for the whole district?—It is not complete at present; the powers are being carried out, and the drainage extended. At present there is a main sewer running from the upper end of the town to midway between the town and the docks, and there it ended, and it discharged itself into an open sewer running along a large piece of flat ground, and the purposes for which we are borrowing the 2,000*l.* is to extend this line of drainage down to the sea.

3221. So that the discharge may be some way out into the sea?—It will be in the sea.

3222. Do all the private houses discharge into this main sewer?—All the new houses do; that is to say, all the houses that have been built in the district since the application of the Act of 1848, and within 100 feet of a main sewer.

3223. Is there any utilization of sewage for agricultural purposes, or is it all discharged into the sea?—It is all discharged into the sea. When the inspector finds it necessary to enter premises under this 59th section to remove nuisances, in case the notices are not complied with he removes it to the depôt of the board, and that manure is sold twice a year, but the sewerage all passes away into the sea. Before passing over the question of sewerage perhaps I may be allowed to make a remark as regards the auxiliary drains. We have found difficulty in getting the parties to connect with the main sewers. Under the 49th section of the Public Health Act of 1848, there is power given to local boards to compel the occupiers of houses who are within 100 feet of the sea on the main sewer to connect. It says, "Be it "enacted, that it shall not be lawful newly to erect "any house or to rebuild any house which may have "been pulled down to or below the floor, commonly "called the ground floor, or to occupy any house so "newly erected or rebuilt, unless and until a covered "drain or drains be constructed, of such size and "materials, and at such level, and with such fall as "upon the report of the surveyor shall appear to be "necessary and sufficient for the proper and effectual drainage of the same and its appurtenances; "and if the sea or a sewer of the local board of "health, or a sewer which they are entitled to use, "be within 100 feet of any part of the site of the "house to be built or rebuilt, the drain or drains so "to be constructed shall lead from and communicate "with such one of those means of drainage as the "local board shall direct." For instance, where there are half a dozen houses all within a distance of 100 feet, supposing the main sewer to be running down the centre of the street in front of them, and there is a side street as it were running up past the end house, there is no power at present to enable the

Board of Health to compel the owner of the premises belonging to the first house to allow the others to pass through them, so that the board must adopt one of two alternatives, they must either have the sewer made under the house, which they generally consider objectionable, or else they will have to make the subordinate sewer, by which I mean the sewer going up the side street, through the premises of all the houses until they get to the last one, which is within 100 feet, thereby being obliged to drain some half a dozen houses at the public expense for the benefit of the individual householder without draining any particular district.

3225. Have you no plan in view for utilizing your sewage?—Not at present.

3226. Have you a code of byelaws?—Yes, we have a code of byelaws.

3227. Are they sanctioned by the Secretary of State?—They have been sanctioned by the Secretary of State.

3228. Do they correspond with the Home Office code?—They do not, not altogether; some of them were framed by the members of our local board of health.

3229. Have you any suggestion to make as to byelaws; do you think that some subjects which are now treated by byelaws might be made part of general legislation?—I think as a principle the less that is left to local boards in the shape of making byelaws the better.

3230. Do you think that too much is left to byelaws now?—I think that many matters that could be incorporated in an Act of Parliament do now form part of byelaws; for instance, I think that there might be a general code of byelaws with regard to sewage.

3231. Have you had any difficulty in enforcing any of your byelaws?—No, we have had no difficulty in enforcing any of them. We have taken care not to attempt to enforce any that we could not see our way clearly to. We have a byelaw with regard to back lanes, that is to say, in connexion with the construction of new streets. One byelaw is to this effect, that such new street shall be provided with a back lane for the removal of refuse, of such width as the board may determine, unless by the special consent of that board. I have never felt justified in enforcing that byelaw, because it appeared to me to be rather beyond the powers granted by the Act of Parliament, the Act of Parliament merely giving local boards power to make byelaws with reference to new streets, and this byelaw going further than that, stating that every new street shall be provided with a back lane.

3232. Are you aware that that byelaw has been held to be invalid?—No; we have never taken any proceedings upon it.

3233. Or any similar byelaw?—No. I think that it would be desirable that there should be some power given to the local board to require the owners of properties who are laying out their property for new streets to show some means of communication from the back of the premises rather than having to go through the house for the removal of refuse.

3234. Have you had any difficulty in recovering any penalties?—No, I am not aware of any instance in which there has been a difficulty.

3235. Do you think that the proceedings for the recovery of penalties are such as they should be under the Act, or have you any suggestion to make?—I think on the whole they are. There is a difficulty with reference to recovering the penalty in connexion with lodging houses. There the complaint must be laid by the party aggrieved or by the local board or any officer of the board. I think that there should be a power given to the police, if necessary, to take out summonses against lodging houses for infringement of the bye-laws.

3236. What other officers are there of your local board besides yourself the clerk, and the inspector of nuisances whom you have mentioned?—There is an assistant inspector; there are no other officers except that we have a local engineer, but he is only an engineer appointed for the carrying out of specific works.

3237. Have you made any regulations as to the new buildings which you say are now springing up at the port, with reference to their plans?—We have byelaws with regard to new buildings, and a plan of every proposed new building is sent in and submitted to the board.

3238. Can the owners lay out the new streets as they please, or must they refer to you?—They must refer to the board before they can lay out their streets; and there is one instance which has come before me recently where the owner of the property submitted a plan, and on one side the street there was a back lane shown; he proposed building a number of small houses there, and on the other side he proposed building villas, and he showed no back lane. I did not conceive that we had power to require him to show a back lane.

3239. And he proceeded with his plan, did he, without any check?—Yes.

3240. Because he thought that you had not the power?—I considered the Act of Parliament, and felt that we had no power. In fact I communicated with Mr. Taylor upon the subject.

3241. When an owner lays out a new street who does all the kerbing, paving, and draining?—That is done before the street is dedicated.

3242. Is the drainage done upon a particular plan sanctioned by you?—Yes.

3243. Of course you would not adopt the street until the drainage was done according to your plan? Quite so. The difficulty that I met with with regard to the back lane was as to the construction of the 28th section of the 24th and 25th Victoria, chapter 61, in reference to the word "street," which says, "it shall not be lawful at any time or times hereafter within the district of any local board to "bring forward any house or building forming part "of any street, or any part thereof, beyond the front "wall of the house or building on either side thereof, "nor to build any addition thereto beyond the front "of such house or building on either side of the "same as aforesaid, without the previous consent of "such Local Board." There have been cases upon the point as to what is a new street, and it has been held that the word "street," under that section, applies only to a row of houses in some degree proximate and continuous, and not to a set of detached houses at irregular distances and not in a continuous line. It is a question to be determined by a jury whether or not a house does form part of a street. It has been held that some facing one way and some another, having no appearance of uniformity, is not a street within the meaning of the Act.

3244. Has there been any decision upon that point?—There has been a decision, in the case of Regina against Fulford, reported in the 10th Law Times, new series, page 346.

3245. (*Mr. Powell.*) As I understand you, the byelaws to which you refer were made under the 34th section of the Act of 1858, which contains the word "street"?—Yes.

3246. In order to ascertain the meaning of the word "street," as used in that section, you refer to a decision under the 28th section of the Act of 1861, where the word "street" is found, which decision the Court gave a certain interpretation to the word "street"?—Quite so. I go beyond that. We have a byelaw as regards the laying out of new streets. The 14th byelaw requires that wherever a new street shall be laid out it shall be provided with a back lane. That clearly, I believe, is beyond the power given under the Local Government Act, which only enables byelaws to be made with regard to making streets. The question is, whether it would not be desirable that the board should have power, if they deemed it necessary, to require a new street to be provided with a back lane.

R. Johnson, Esq.

14 June 1869.

3247. (*Chairman.*) Have you any objection to the exemption of rural land from rating?—No, I think not. I think it is fair, or at any rate I think that land should pay a smaller proportion than houses, because sewage works and many works are not required for land that are really required for houses.

3248. Do you think that you ought to have greater power than you have at present to contract for works or to raise money?—There are certain powers now given for constructing works by private contract under a certain sum of money; beyond that sum there are certain forms to be gone through, such as making estimates and taking contracts. I think it is a very salutary provision that tenders should be received and contracts entered into for all works rather than to give local boards the power of doing the work themselves otherwise than by contract. I think that the ratepayers, as a rule, would be very much more satisfied to see that their works were done by contract than left to the discretion of the local board to do the work entirely themselves. I think that would be the experience that I should find at Llanelly at any rate.

3249. Is there any alteration in the law upon that point which you would suggest?—No, I think that the law gives sufficient power to local boards. I think that the ratepayers as a rule, especially at Llanelly, look very interestedly and closely into the acts done by the board, and when we take tenders for works I am always instructed to insert in the minutes of the board the amount of every tender which is submitted.

3250. Could you state to the Commission the rate of mortality at Llanelly?—I cannot tell the rate of mortality of the last two or three years. I have with me a report made by Dr. Hunter some three years ago, and at that time it was rather high.

3251. Can you state that the rate of mortality has been reduced by your public works during the last 20 years, or since 1850?—I should say that it has been. I am not prepared to state what the rate of mortality was at that time, beyond what appears in Dr. Hunter's report.

3252. Were there any particular localities in Llanelly where fever constantly existed before your works were made?—No, not that I am aware of, no particular parts. It was a singular feature in the time of the cholera that the cholera broke out at the highest point of the town rather than on the flats.

3253. Have you any suggestion that you wish to make which my questions have not drawn out?—There is one point which I should wish to refer to, and that is the disqualification of members of local boards, with regard to which I have found a difficulty. Under the 19th section of the Public Health Act of 1848, it is enacted amongst other things that if a member "shall in any manner be concerned in any "bargain or contract entered into by such board, or "participate in the profit thereof," he shall become disqualified. Under the 25th section of the 21st and 22d Victoria, chapter 98, it is enacted that "no "member of a local board shall vacate his office by "reason of his being interested in any sale or lease "of any lands, or any loan of money to the local "board." It does not appear quite clear from that section whether a member of a local board interested in any sale or lease of lands from the local board becomes disqualified. The point that I intended to bring before the Commission is this, that by the 25th section it is declared that no member of the board shall be disqualified in consequence of his being so interested. There is an instance now in our board in which one of the most efficient members of the board has taken the transfer of a lease that was granted some years ago by the local board to an individual,—that individual transferred it to two others, it ultimately became the property of a limited company, and the company becoming wound-up the property was sold under the direction of the Court of Chancery, and this member of the board bought that lease. Of course at the time the lease was granted, or rather at the time the property passed to him, although he was a member of the board, that could not possibly affect the rent or anything else payable under that lease; under my advice he discontinued sitting at the board, and his disqualification will be removed in the course of a few weeks. I took the opinion of Mr. Taylor upon it before acting upon it, and he seemed to make a difficulty over it. Mr. Taylor considered that both views were capable of being sustained by argument.

3254. (*Mr. Hibbert.*) Do you know who are the authorities in the other parts of the parish of Llanelly outside your local government district?—The board of guardians.

3255. Have you paid any attention to that part of the question as to whether the duties are properly performed by the guardians?—No, I have not. I believe that in the few instances that have been brought before the justices, the Nuisances Removal Act is very well carried out by the guardians in the union of Llanelly, but I think that as the local board of health is the local authority for carrying out the Nuisances Removal Act and most of the sanitary Acts, it would be very desirable that they should also be the local authority for carrying out the Diseases Prevention Act which makes the board of guardians the local authority. We felt that difficulty in 1866.

3256. You mean that you have two authorities acting in your district; that is to say, you have the authority under the Local Government Act acting generally in your district, but under the Diseases Prevention Act the board of guardians are the authority?—Yes, I know difficulty was met with at the time that it became necessary to put that Act in force. At the time of the cholera in 1866 the board of guardians were the local authority for executing that Act, not only beyond the district of the local board, but also within the district of the local board; and by arrangement at that time, the local board executed that Act, and the expenses were charged to the guardians afterwards, who paid them.

3257. Your suggestion is that the powers under the Diseases Prevention Act should be given to the local board?—That in all districts under the control of a local board the local board should be the local authority for executing the Diseases Prevention Act.

3258. (*Lieut.-Col. Ewart.*) You mentioned the fact that when the cholera occurred it attacked the upper part of the town; how was that part of the town supplied with water at that time?—The whole town is supplied by one waterworks, and was at the time that that occurred.

3259. In the new sewage arrangements to which you allude there is to be only one outfall or discharge towards the sea?—Only one.

3260. Will it be in front of the town where it is at all densely populated?—It may be rather thickly populated, but it is a small part of the town; it is near to the port in fact. There are three docks, and it is between the three docks. When Dr. Hunter made the report which I have referred to he suggested that there should be a ventilating shaft erected at one of the highest points of the town. That was done, but it was only partially carried out in consequence of there being simply a shaft without any charcoal or furnace or anything at the base of the chimney to destroy the gases as they passed up. It was thought generally, I do not know whether with any foundation or not, that those gases passing up through the chimney were driven down again upon the town, and especially on that part where the cholera broke out, which was just beyond and rather at a higher point than where the shaft was erected. In fact, that idea gained so much belief that the shaft was obliged to be taken away, and it has never been erected since.

3261. Have you any other provision for ventilating the sewers?—There are brick shafts from the manholes with charcoal baskets and open gratings.

3262. Are the sewers trapped?—Yes, I should

think that now they are trapped throughout the entire district.

3263. This system of sewage which you are now carrying out is being carried out, is it not, with money borrowed by mortgaging the rates of the place?—Yes.

3264. Had the plan for carrying it out been approved before you were allowed to mortgage the rates?—Of necessity they must have been so before we could get permission to borrow.

3265. (*Dr. Acland.*) Did I understand you to say that the local board executed all works connected with the cholera epidemic under the Diseases Prevention Act?—Yes.

3266. Should you advise in your own case, and in other cases also, that all such sanitary works should be done by local boards?—I think so for this reason, that under all the sanitary Acts the local authority is the local board in districts where there are local boards.

3267. Would the guardians object to it?—I apprehend that inasmuch as they came to an arrangement with the local board in 1866 that the latter should execute the Diseases Prevention Act, they could not possibly have any objection to the local board being the authority for carrying out that Act within their own district.

3268. Then you would confine the functions of the guardians really to their main purpose, the medical care of the paupers properly so called?—No. The board of guardians of course is the local authority for executing all the Nuisances Removal Acts beyond the district of the board, but they are also the local authority for executing the Diseases Prevention Act within the limits of the local board. It is only as far as a local board district is concerned that I make the suggestion, not beyond it.

3269. Was there any difficulty about the expenses of the guardians under that arrangement?—None whatever; we had no difficulty at all.

3270. Does the local board use the medical officer of the guardians at all for sanitary purposes?—No.

3271. Have you an officer of health of your own?—We have no officer of health.

3272. If there is any prevalent fever in any part of the town, how does it come officially to your knowledge?—I do not know that it comes officially in any way.

3273. It did in the cholera epidemic, for instance, did it not?—The local board took the initiative; it was not brought before them.

3274. (*Mr. Richards.*) Do you know how many houses built previous to the adoption of the Public Health Act in Llanelly are drained into the sewer?—No, I do not know that.

3275. Are there any considerable number of old houses not drained?—Yes; there are a considerable number that are drained. I should say that the great majority of the old houses of the better part of the town are drained into the main sewer.

3276. Is that the part where the working people live?—No, there would be no system of drainage there at all. As regards that part of the town, it was built upon prior to the adoption of the Public Health Act.

3277. Are the main sewers of the board extended into that part of the town?—To a certain extent they are. The drainage system is not complete at present, but it is being carried on.

3278. The difficulty to which you have referred in respect of the owners of property passing into the property adjoining them for the purpose of drainage would be got over altogether, would it not, if the board constructed a subordinate sewer at the back of the houses?—Yes.

3279. And would not that be at the same time a solution of all your difficulties?—Quite so; it is done in many districts, I am aware, but still that is done at the expense of the board, and not generally for the benefit of the ratepayers, but for the interest of a few houses.

3280. But if the drainage works are carried out by the board they are paid for out of the public money, the repayment extending over 20 or 30 years?—That I believe is the system adopted in Swansea.

3281. (*Mr. Powell.*) Have you in your district chiefly in use privies and ashpits, or waterclosets?—They are, I think, chiefly waterclosets or privies. In some instances there are neither one nor the other.

3282. When you use the term "instances," do you mean that there are three or four houses with only one privy, or that there are some houses without access of right to such accommodation in any way?—In many instances I have no doubt houses might be found with only one privy to three or four, and I think it possible that there might be found houses without any accommodation at all, in some of the very old parts of the town.

3283. Is your system of drainage so complete that the matters are satisfactorily drained off from your waterclosets?—Yes; that is to say, if the parties think fit to communicate their waterclosets with the main sewer.

3284. As a matter of fact, are there waterclosets not communicating with the sewers?—I am not aware of any.

3285. (*Chairman.*) I understood you to say that you took very good care that new buildings communicated, but you did not give us any very satisfactory account of the older ones?—No; there is no power given to the local board to compel the owners of houses that were built before the adoption of the Act to do any of those works.

3286. Is it your belief that any of the old houses built before the adoption of the Act have communicated with the sewer?—I think that some old houses have; my own house for instance was a house erected before the adoption of the Act, and that communicates both the watercloset and also the drains of the house.

3287. (*Mr. Powell.*) You stated in answer to several questions that during the cholera epidemic, by what you describe as an arrangement, the local board acted instead of the guardians, had you in mind the 11th section of the Nuisance and Diseases Amendment Act, 1860, which enables the Privy Council to confer authority upon a town council or local board in such case?—I have not considered that.

3288. But as a matter of fact, was application made to the Privy Council under that section?—No.

3289. You stated that a certain loan which you mentioned was to be repaid in 30 years, I presume that you meant that it was to be repaid by the community in 30 years?—Yes, by the ratepayers.

3290. But you do not mean that the lender lent the money for 30 years, each individual loan was probably for a short term, and your plan is to reborrow at the expiration of successive short terms?—No, it is 30 years from the advance of the loan in each case.

3291. Is the lender to remain out of his money for 30 years?—Yes, quite so.

3292. The money being repaid periodically by instalments?—Yes, by annual instalments; there is no sinking fund. The instalment is an annual instalment extending over a period of 30 years for the greater part of the loans. The loan of 10,000*l.* for markets is repayable over 50 years.

3293. You stated, with reference to your private Act for water, that if you had proceeded under the public Act you must have compensated certain owners, was there anything to your mind unfair or wrong in the owners being thus compensated?—At that time there was a very urgent want of water not only for domestic purposes but also for the purposes of works, and it would have caused a great delay in compensating the owners beforehand.

3294. Do you mean compensation by money or compensation by compensation reservoirs?—I mean compensation by money.

3295. Were those owners deterred from any opposition by the expense of opposing your private Act?

—No; there was a section inserted in the Act of Parliament giving them power to call upon the board to buy up their interest in the mills, provided they gave them notice within a certain time, in fact the board are by arrangements buying up the greater part if not the whole of the interests of the mills, they are negociating and they will buy up the whole of the interest with the exception of one, and I think it possible that that interest also will be purchased.

3296. How is the value to be arrived at?—The Lands Clauses Act applies to that case.

3297. You stated that you had only one inspector of nuisances, how many assistants has he?—One assistant.

3298. Can you give me the salary of each?—The salary of the surveyor is 130*l.* a year, and he is our inspector.

3299. What is the salary of the subordinate inspector?—1*l.* 2*s.* 0*d.* per week.

3300. Do you consider that the sanitary powers which you can exercise over the port are sufficient?—Quite so.

3301. How often does your local board meet?—Under our byelaws we are obliged to meet monthly, and of late years, in consequence of the business of the board having increased so much, we meet every fortnight regularly. We have a monthly meeting, and we adjourn that monthly meeting.

3302. Are plans for proposed buildings laid before those fortnightly meetings?—Yes.

3303. Then practically no one who proposes to build can be kept waiting more than a fortnight?—Not longer than 14 days.

3304. And you thoroughly exhaust the list of applications at those meetings?—Yes.

3305. Can you give any reasons why there should be a back road behind the villas which you have mentioned?—If the ground is already laid out for villas there can be no necessity for a back lane, but it might possibly occur that the owner did not carry out his original plan; he might partially. He might build one or two villas according to the opportunities which he might have of letting his land; and then possibly he might build three or four in a row.

3306. But in case of his abandoning that plan and adopting another he must lay his plans before you, must he not?—Yes, I am aware of that. He must lay his plan before us for amendment.

3307. Then I do not think that you can lay before the Commission any substantial reason why a back road should be insisted upon in villa property?—When a plan of that description comes before the board there is nothing satisfactory to the board as a means of communication with the backs of those houses for the removal of ashes.

3308. But surely considerations of that kind may fairly be left to those who wish to lay out their property for what would be described as eligible villas?—I think that is questionable. If plans are to be submitted to the local board for approval, I think power should be given to the local board to see that what they may consider the requisite requirements should appear upon the plan.

3309. You think then that in the case of property of that class more should be insisted upon than a speculator would naturally design for the benefit of his tenants?—Not more would be required of the owner upon a plan of that description than there would be if there were submitted a plan for building a regular line of buildings. There is nothing more required; it is merely putting him on the same footing as an owner who submits a plan for a regular line of buildings.

3310. (*Mr. Russell Gurney.*) Do I rightly understand you that a considerable number of buildings before the Public Health Act of 1848 would have no drainage?—I should think it is possible that there might be many houses in the older parts of the town in that state.

3311. Then that is because you have not constructed a sewer within the required distance, 100 feet of those houses, because, as you are aware, under the 49th clause of that Act if there is a sewer within 100 feet, whether the house is built before or after the Act, you have the power of compelling a drain, for the clause says: "If at any time upon the report "of the surveyor it appears to the said local board "that any house, whether built before or after the "time when this Act is applied to the district in "which it is situate is without any drain," he may be compelled to construct it?—Yes, but that does not compel him to communicate with the main sewer. I take it, he must have some means of drainage, but I conceive that it does not confer the power upon the board to compel him to drain into their main sewer.

3312. It says, "Or without such a drain or drains "communicating with the sea or a sewer as is or are "sufficient for the proper and effectual drainage of "the same." You do not want anything more than that?—I understood the question when put to me to be with reference to compelling the owners of houses to communicate with the main sewer.

3313. Is it not the fact that you have neglected to construct a main sewer at a reasonable distance from those houses?—I am not aware of any neglect on the part of the board. They have been carrying on their drainage works as rapidly and efficiently as they can do so, and they have laid out considerable sums of money for sewage purposes.

3314. But still there are a considerable number of old buildings which are without a sewer within 100 feet of the buildings?—Yes, no doubt of it.

3315. (*Mr. Cave.*) What is the tonnage of the vessels which ordinarily frequent the port of Llanelly?—The register tonnage of vessels for the year 1868 was 174,758; the tonnage of individual vessels from 520 tons downwards; the average tonnage of vessels 95 tons.

3316. Have you a local marine board?—No, there is no marine board; there is the Board of Harbour Commissioners; that is the only marine board.

3317. Do they take in hand the sanitary arrangements of the port?—No, they have nothing to do with the sanitary arrangements.

3318. Then has your local board the command of the police of the port and every authority over the port?—That part of the port that is within the district board they have; in fact the whole of the port is within the district board. The board has no control over the police.

3319. For instance, in the case of an epidemic or the report of disease on board ship, do you send or go on board the ships to see what state they are in?—We have never had any occasion to exercise those powers.

3320. Have you not had any outbreak of disease among the shipping?—No, we have not. I believe some few years ago there were one or two cases of yellow fever.

3321. What course was taken on that occasion?—I think there were only one or two cases. The local board at any rate did not interfere in the matter.

3322. You do not know whether the board would interfere in the case of an outbreak of dangerous disease in the port?—I apprehend that as far as the execution of the provisions of the Nuisances Removal Act and the Sanitary Acts is concerned, the local board would be the authority to interfere, and if it became necessary to put into operation the Diseases Prevention Act, then the board of guardians would come into play.

3323. In the case of the yellow fever, which is a very dangerous disease, you do not know whether anybody interfered on that occasion?—The chairman of the local board ordered the vessel to be moved from the docks and to be disinfected.

3324. Is there any authority or board for the examination of seamen, and certifying that they are fit to serve on board ship?—There is a medical inspector for the port.

3325. (*Earl of Romney.*) You stated that the main sewer discharged itself into the port very near

to some houses; what is the nature of the port of Llanelly? Is there a river discharging there?—The river Bury comes up there; it is a tidal river.

3326. How long has this sewer been discharging in that place?—The sewer is being constructed now. The 2,000*l.* that I spoke of which we are about borrowing, is for the purpose of continuing the main sewer from midway down to the railway station at a point where there are some ironworks down to the outfall.

3327. Is that sewer at present at work?—No, it is being constructed. The main sewer that was constructed by the board did not extend beyond about midway between the town and the railway station; then it goes into an open ditch, and that open ditch of course went down to the sea; there was no complete system of sewerage to the outfall.

3328. Have you any means of knowing whether there is likely to be an accumulation of this matter where the sewer will discharge itself?—I cannot conceive that there will be; it is a tidal river, and what sewerage passes the outfall will be taken away by the tide; it is in the tide-way.

3329. Do not you know that sometimes in the sea, and in tidal rivers, sewage matter descends at once, and settles on the shore?—I am not aware.

3330. (*Mr. Russell Gurney.*) You state that you are constructing this main sewer, what length have you constructed within the last twelve months?—None within the last twelve months, not of the main sewers.

3331. How long is it since any were constructed?—There have been subordinate sewers constructed, but as to the main sewer, I take it that not any of the main sewer has been constructed since the 14,000*l.* was expended; the 5,000*l.* and the 1,500*l.* were borrowed lately, in the year 1863.

3332. Since that time there have been no additional main sewers?—I should say there had not; not a continuation of them.

3333. I thought you said that you were continuing them as fast as you could?—We are now; the work is being proceeded with at the present time.

3334. (*Chairman.*) Have you anything else which you wish to suggest to the Commission?—I would suggest that there should be power given to the local board, if they think fit, to require a pig or any other animal to be removed or not be kept within a certain distance of a dwelling-house, in many instances they are kept just outside the doors.

The witness withdrew.

(20.) The Rev. Robert William Hippisley examined.

3335. (*Chairman.*) You are rector of the parish of Stow-on-the-Wold in Gloucestershire, are you not?—I am.

3336. What is the population of Stow-on-the-Wold?—The parish contains about 1,600 persons.

3337. Can you state the acreage of the parish?—I do not think it is more than 16 acres, it is a very remarkable place, there is no land belonging to the parish, but a small close, which is mine as rector, of about two acres of land.

3338. What is the nature of your local government?—We have nothing but the vestry under the Sanitary Act of 1866, and all the powers of the vestry have been delegated to a committee of the vestry.

3339. Under what powers are they enabled to delegate their functions to a committee?—They have power of so doing under Part I. sect. 4 of the Sanitary Act of 1866. The 4th section of that Act says that, "Any "sewer authority may from time to time, at any meeting specially convened for the purpose, form one or "more committee or committees consisting wholly "of its own members, or partly of its own members "and partly of such other persons contributing to "the rate or fund out of which the expenses incurred "by such authority are paid, and qualified in such "other manner as the sewer authority may determine, and may delegate, with or without conditions "or restrictions, to any committee so formed all or "any powers of such sewer authority, and may from "time to time revoke, add to, or alter any powers "so given to a committee." It appears also that the proceedings of such committee are not invalidated by any vacancy or vacancies amongst its members; and there is another clause which says that "A sewer "authority may from time to time add to or diminish "the number of its members or otherwise alter the "constitution of any committee formed by it, or "dissolve any committee." And the last clause explains the responsibilities of a vestry, notwithstanding a committee has been appointed: "A committee of the sewer "authority shall be deemed to be the agents of that "authority, and the appointment of such committee "shall not relieve the sewer authority from any obli-"gation imposed on it by Act of Parliament or otherwise." Under this section of the Act we did, almost immediately after the passing of the Act, appoint a committee of 15 persons, but of those 15 persons, in consequence of the seeming insolent conduct of some of its members towards the others, and the withdrawal of another who was found to be ineligible, the better portion of that committee resigned, and left the affairs of the vestry in the hands of I do not believe above nine persons.

3340. Do you mean that six of 15 resigned?—Yes; and at a vestry meeting, held Sept. 20th 1866, one more resigned.
